THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . . .

6, GREAT NEW STREET, FETTER LANE,
LONDON.

Architects: Advertising Themselves, 179; Royal Institute of British, 12, 71, 103, 112, 150, 180, 196, 230, 273, 277, 283, 298, 360; Charges, 75. 232, 302, 311, 344; Glasgow Institute of, 142; of Ireland, Royal Institute of, 274; and the L.C.C., 154; Manchester Society of, 29, 68; and Surveyors, Sheffield Society of, 9, 92, 161; Society of, 40, 46, 84, 99, 157, 206.
Architectural Association: 22, 35, 59, 81, 114, 176, 283; Edinburgh, 6, 56, 68, 260; Glasgow, 154; of Ireland, 60, 85, 117, 118, 160.
Architectural: Competitions, The Reform of, 279; History, 75; Society, Leeds and Yorkshire, 7; Vigilance Committee, London, 28.
Architecture: Contemporary, 86; Dreams of, 171; Egyptian, 230; For French, 95; Ancient Grecian, 32; and Hygiene, 329; Modern, 143; and the Public, 176; at the Royal Academy, 175; at the Scotch Academy, 165; Scottish Domestic, 186.
Art: in South Africa, 243; German, 192; Schools, Birmingham's Municipal, 359; in Towns, 319.
Articled Student, 303.
Arts, Fine, Glasgow Institute of, 21.
Asylum, A New, for the L.C.C., 215.
Austria-Hungary, Brickmaking in, 273.
Avignon, Walls of, 192.

BAKEHOUSES, Design and Construction of, 328.
Balzac: the Client, 17; House of, 50.
Barbed Wire, 73.
Barbican, Sandwich, 89.
Barnsley, Buildings to Measure around, 191.
Basements, Water in, 244.
Bath, Buildings to Measure at, 311.
Baths, Liverpool, Competition, 143, 171;
Beams, Bending Moments of, 120, 151.
Bede, Memorial, 184.
Bills, Three, 33.
Birmingham: Art Masters of, 234, 359; Buildings to Measure near, 302.
Bitumen, 146.
Block, Wood-, Floors, 27.
Books: American Architectural Journals, 311; Richardson's "Architecture," 166; Bakehouses, 87; Bookkeeping, 107; Carving and Woodwork, 191; Cements, 179; Church Ventilation, 137; Classic and Mediæval Ornament, 107; Engineering, 207; Estimating, 55; Greek Mouldings, 232; Hydraulics, 120; Infectious Diseases Hospitals, 87; Marble, 76; Masonry, 207; Mensuration, 107; Bakers' Ovens, 166; Quantity Surveying, 107; Repairs. and how to measure them, 87; Roof Carpentry, 166; for R.I.B.A. Intermediate Examination, 76; Sewerage Treatment, 107; Specifications, 179; Stair Building, 166; Stresses and Strains, 232; for Surveyors and Sanitary Inspectors, 232; Timbers, 232; Water Towers, 107.
Boiler Setting, Size of Flue and, 55.
Boilers, Copper, Patent, 289.
Borings for Water-Supply in Sussex, 343.
Boundary of Property: 137; Adjoining Owners, 192; Building to, 179.
Bradford, Buildings to Measure around, 179.
Brickmaking: 246; in Austria-Hungary, 273.
Bricks: Campanile, 184; and Mortar, 6, 32, 48, 56, 69, 86, 101, 118, 132, 154, 165, 184, 192, 206, 233, 287, 301, 316, 332, 346, 359; Old, for Rough-cast House, 207; Standardizing, 277.
Brickwork: Hollows in, North and South Practice in Quantities, 276; Porous, 180.
Bridge: Kew, 235; Lambeth, 111; The Roof of Pavia, 319; of the Future, Sydney, 32; Vauxhall, 201; Widnes and Runcorn, 41.
Builders: Notes 14, 30, 57, 70, 93, 104, 124, 136, 164, 183, 199, 210, 225, 239, 255, 286, 300, 314, 326, 345, 353; who are Town Councillors, Positions of, 77.
Building: Acts, London (Amendment), 1903, Bill, 19, 33, 47, 58; on Chalk, 151; Construction, 13, 181; Construction, Examinations in, 107, 288; Construction from a Fire-Brigade Officer's Point of View, 322; Co-operative, 276; Exhibition, International, 58; Trade in South Africa, 209, 291, 352; Trades' Exhibition, The International, 120, 263.
Buildings: Fire-resisting, 112; to Measure: near Abergavenny, 137, 142; around Barnsley, 191; at Bath, 311; near Birmingham, 302; around Bradford, 179; in the Cotswolds, 302; at Devizes, 311; around Ealing, 45; at Epsom, 119; near Godalming, 302; at Horsham, 119; at Kendal, 311; at Kingston, 119; around Liverpool, 233; in London, 232; at Luton, 311; near Manchester, 151; around Monmouth and Ripley, 289; around Nottingham, 55; at Plymouth, 107; near Seaton, 302; near Sherborne, 302; at Wakefield, 355; near Westminster, 75.
Bulgarian Houses, 132.

CAMBRIDGE, Some, Colleges, 65, 80.
Campanile, St. Mark's, Venice, 34, 79, 184.
Canterbury, Cathedral, Spoiling, 118.
Cape, University Competition, 201.
Carpenters' Company, 311.
Casket presented to Mr. Chamberlain, 287.
Castle, Richborough, 287.
Castles, Scotch, 118, 131.
Cathedral: Canterbury, Spoiling, 118; Exeter, West Window, 6, 17, 56, 69; Liverpool, Competition, 1, 201, 215, 216, 229, 258; St. Paul's, Decorations in, 64, 67; Old St. Paul's, 232; Truro, 180, 345; Wakefield, 117; Westminster, 33, 71, 84, 154, 215, 277.
Cellars, Water in, 87.
Cement: Tests, Fallacious, 193; on Tiles, Removing, 207; Trade in 1902, 15.
Cesspools, 120.
Chalk, Building on, 151.
Chamberlain, Mr., Casket presented to, 287.
Chapel, Competition for a New Baptist, at Wavertree, Liverpool, 95.
Charges, Architects', 75, 232, 302, 311, 344.
Chemical Terms, 55.
Chimney Breasts and Wall on Upper Floor, Carrying, 343.
Chimneys, Tall, Designing, 46.
Church: Design, 179; Country, to Measure within fifteen miles of Westminster, 75; St. Peter's, Hambledon, 172; St. Nicholas's, Leicester, 261; All Hallows', Lombard Street, London, 1; St. Bartholomew-the-Great, Smithfield, 102; St. Mary Aldermary, 125; Mickleham, 32; Newland, 32; The Smallest, in England, 56; St. Margaret's, Westminster. 191; West Walton, 166; White Roding, Essex, 25; Winchelsea, 179.
Churches: Modern, 26; Somersetshire, 127; Ancient, of Wirral, 334.
Cistern, Noisy, 208.
City Buildings, Wood in, 111.
Clerks of Works: Association, 31; Councillors as, 87; under Government, 311.
Clifford's Inn, 155.
Cluny Museum, Paris, 1.
College: Eton, Measured Drawings of, 55, 77; Planning, 12.
Colleges, Some Cambridge, 65, 80.
Colosseum, An American, 316.
Colouring Copper Green, 180.
Column, Entasis on, 233.
Columns, Concrete, Safe Load on, 302.
Commercial Establishments, Large Retail, The Planning and Arrangement of, 324.
Common Land, Building on, 303.
Competition, National, Drawings for, 191.
Competitions 59; The Reform of Architectural, 279.
Concrete: Columns, Safe Load on, 302; Floors, 120; and Hollow Tile Construction, 178; Houses, 64; Reservoir, Circular, 75; Slab, Strength of, 45; for Stable, 87.
Congress: The Fire Prevention, 316, 321; Public Health, 341; Sanitary Institute, 327, 337.
Construction: The Effect of Design on, 177, 197; The Architect's Knowledge of, 183.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

Feb. 18, 1903. Vol. 17, No. 419. 9, East Harding Street, E.C.

The Cluny Museum, Paris. NOT often is it given to a collection of antiquities and works of art to be housed in so interesting a building as the Hôtel Cluny. To wander through room after room filled with characteristic old French furniture, tapestry, armour, jewellery, carvings in many materials, and ancient Gothic crowns is pleasant and—if the process be not hurried—instructive at any time; but such things, however valuable, are usually contained in a modern building. The Cluny collection is distributed throughout the rooms and galleries of the "hotel" or town residence of the old Abbots of Cluny. A little courtyard separates it from the street; the building, erected between 1480 and 1505, is long and comparatively low—low, that is, for a French design; it is simple, with flat-topped windows, each broken only by a strong stone mullion and transom; dormers, very light and ornate, divide the roof, and towers in the interior angles contain the old doorways; the whole design is easily grasped, and it is matter for regret that this phase of French domestic architecture, contemporary with our Tudor manor-houses and colleges, lasted for so short a time, or has at least left so few examples in Paris. Here we miss our familiar Tudor arch; its place is taken either by the flattened "ogee" which has an appearance of weakness or by a flat lintel, but there is a decided air of quaintness about the place. The contents are not on the scale of those at South Kensington, nor is the armour equal to that of the Wallace collection; the furniture, hangings, arms and carvings, however, seem singularly appropriate when placed in rooms very often of the same period as themselves; this it is which gives the Musée Cluny its charm and interest. The chapel, small though lofty, is very striking; a single column in the centre spreads at the summit into an elaborate vaulted roof not unlike a small edition of the Chapter-House at Westminster; a spiral staircase, now used for the visitor's exit, was evidently built to enable the abbot to scrutinize and possibly reject undesirable strangers at service; a cage of stone tracery in Flamboyant openwork protects the head of the stairs, and its opening is so narrow that only one person at a time can enter. Adjoining and even forming part of the "Hotel" are the remains of the Roman baths built by Constantius and rebuilt or improved by Julian the Apostate. The great frigidarium remains, a vaulted hall 65ft. by 45ft. and 54ft. high; all ornamental work has disappeared, but the apartment is not without grandeur; it is built of alternate courses of squared stones and bricks, covered in parts with 4in. or 5in. of cement; the tepidarium and the hypocaustum for the warming apparatus can still be discerned. Throughout the Hôtel Cluny the great fireplaces are very striking; the Continent in our day is no place for cheerful "firesides," as an Englishman speedily finds who travels in the winter, but open fires were once as general as with us; in this case their carvings and ornaments exhibit beautiful Renaissance detail mingled with Gothic. The traveller who takes his Musée Cluny in leisurely and appreciative fashion feels as he leaves it that he has had a glimpse of Old France and her arts at a particular epoch, instead of the endless galleries filled with the productions of many ages usually associated with foreign "sight-seeing." A remarkable feature of the interior is the absence of ceilings in many of the rooms; the oaken rafters overhead are left bare and simple, though they are not undecorative. The only stained glass observable is provided by the blazon of the old abbots in every window. The building with its contents was bequeathed to the French nation by the late M. du Sommerard.

———

All Hallows', Lombard Street. THE Bishop of London is still considering his attitude in regard to the fate of Wren's last ecclesiastical work in the City. So far his Lordship has cast in his vote with the destroyer, and it is still possible that "the claims of the diocese" will militate against any question of sentiment and the claims of Wren's work upon the reverence and forbearance of his countrymen. Even if the Bishop finally decides to vote for demolition it will still be possible to avert such an artistic, religious and architectural disaster, for the parishioners have the power to veto the scheme, in which case the Bishop cannot proceed without a Parliamentary Bill. This should be very clearly understood. The Bishop has, unfortunately, a very exaggerated idea of the value of the site, which is completely hemmed in by buildings possessing ancient lights over the narrow courts and the strip of churchyard which separate them from the church. Possibly, when it is too late, it will be found that the sum obtainable is out of all proportion to the value of the church from an architectural and educational standpoint. The reason given for destruction is, as usual, that the church has outlived its usefulness. This is not true, as can be proved by the church attendances, and the number of communicants in proportion to the population, but the point is immaterial. When the modern vandal is bent on destruction his speech is plausible and his ways devious. Indeed, it is a strange new race of divines that has come upon us, whose actions are governed by money—to whose deaf ears art, beauty, sentiment and eight centuries of consecration appeal in vain. If the Anglican Church cannot find money to build her new churches without selling or pawning her treasures and sacred buildings, then her mission as a Church should end. The destruction of All Hallows is a strange proposal to appear at the moment when the nation has relieved the Anglican community of the cost of education in its schools.

———

More of Liverpool Cathedral. WE do not envy the Liverpool Cathedral Committee. They have created a veritable mountain of prejudice against themselves. Of the designs we hear no more for the present (though the whole question will be reopened when the new designs are exhibited, presumably about the end of this summer), but some caustic remarks have been made about Sir William Forwood's recent statements as to the cost of the work. Sir William strongly resented the remark in the "Times" that it was "almost impossible to arouse any enthusiasm in Liverpool in favour of the cathedral scheme," for the Committee already have £160,000 at their disposal, and when another £40,000 is forthcoming they hope to be in a position to lay the foundation-stone. Sir William asks us to remember that £160,000 exceeds the amount expended on Truro Cathedral, and is almost equal to that spent on Westminster Cathedral; but, as Mr. Myddelton Shallcross points out, the shells only of these great buildings have been erected for the sum named—indeed, when one considers the finishing of Westminster Cathedral according to Bentley's intention the cost is staggering—and at Liverpool there is likely to be great trouble with the site in order that a good foundation may be had on the rock that lies 40ft. below the surface (£100,000 is suggested as the sum needed for this work).

However, Sir William's ideas are no mean ones, for he talks about £500,000 as the ultimate cost of the cathedral on the site which is "second to none in Europe" (there is a wonderful sound in that statement—what a pity one cannot agree !). But between the £200,000 to be ready when the first stone is laid and the ultimate £500,000 there is a difference that it will be troublesome to settle. When the scheme was first mooted a million of money was mentioned as the cost, half to be provided by this generation. Since then the idea has shrunk by one-half. To make much comment on the matter when the design even is not selected would be premature; and while not wishing to prejudice the Committee's appeal, we cannot help expressing the opinion that something like a miracle will be required to find so much money as that suggested.

RECENT WORK IN OXFORD.

By F. HERBERT MANSFORD

(*Photographs by Joseph Mansell.*)

IN its issue for November 13th, 1901, the Builders' Journal published a list of new buildings recently erected in Oxford, with a note on various works of restoration there. This naturally suggested a journey to the city to see with one's own eyes these changes; for Oxford, in spite of its ineffective situation, commands the undying interest of every lover of architecture in this country. A jealous anxiety for its beauties which accompanies the appreciation of them provokes the question, "Is Oxford as beautiful as ever?" But when does a jealous lover get a perfectly convincing and long satisfying answer? Absent from his mistress, the news of some fresh alteration in or about her stirs his feelings afresh. Stepping from the new Shelley Memorial into the "High," and contemplating the buildings between the spire of All Saints' and the tower of Magdalen, we exclaim inwardly, "Yes, beautiful as ever," and reflect that never can the colleges have contained a greater accumulation of paintings, sculptures, books and other treasures. But the visit concluded, even as we leave the city we note the spreading of the commonplace streets which obscure any comprehensive view from the main approaches.

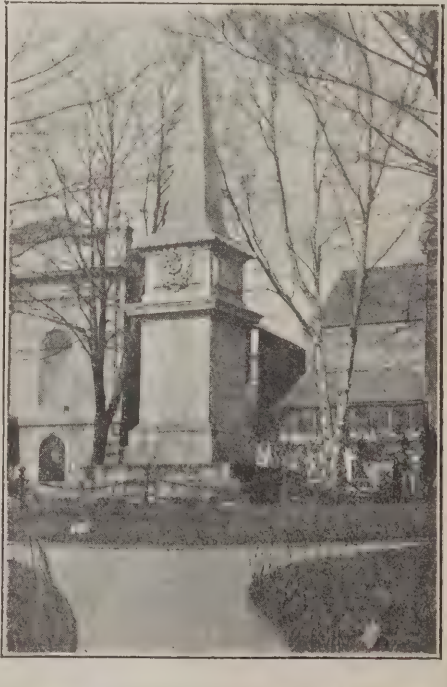
JUBILEE DRINKING FOUNTAIN ON THE PLAIN, OXFORD. E. P. WARREN, ARCHITECT.

INN NEAR FOLLY BRIDGE, OXFORD.

At the time of the Civil Wars the traveller from the west, shadowed by the ruins of Osney Abbey, passed through St. Thomas Street, when a few houses only lined the road, skirted the castle and mill, and so beneath the west gate to Carfax. On the north he found few houses beyond St. Giles's Church, and the buildings of Worcester College (then St. John the Baptist's Hall) stood in the open country. In place of the long rows of shops and villas which now form the approaches from the east, he found a few houses surrounding St. Clement's Church (then in the centre of the roadway leading on to Magdalen Bridge), and scarcely considered himself in town until he had passed below the Chapel of the Holy Trinity, which was above the east gate, near the site of the present Examination Schools. On the south, St. Aldate's Street stretched down to Folly Bridge; the city gate stood between Pembroke and Christ's, just above Bishop King's house. As the river is no longer an important approach to Oxford the town has spread less in this direction than in others; probably the damp situation has also been a factor. The walls were then the visible boundary of the city and proved very effective barriers to the advance of the Roundheads. On the west, south and east sides the Isis, the Cherwell and numerous watercourses, now partly diverted or covered in, meandered o'er the plain or turned it into a vast lake, according to the season, whilst always the citizen looked out upon a placid landscape of watery meadow and wooded hill. Nor can this state of things have greatly altered for many years; even in 1801 the population of the place was only a quarter of that recorded in the last census. Since that date not only have the number of houses increased, but the University has been dignified by the foundation of Keble, Mansfield and Manchester Colleges, by the erection of "the Taylorian," the museums, the noble Examination Schools, the Indian Institute and the new Radcliffe Library; by the enlargement of various colleges, and the restoration and enrichment of their chapels. Half a century ago there were no tapestries by Morris, windows by Burne-Jones, paintings by Holman Hunt, Watts and Frank Holl; no incomparable memorial of Shelley. Neither had the citizens erected the fine town-hall nor the churches by Street, Blomfield, Champneys, Mowbray and Bodley.

Coming to the immediate subject of these notes, it is to be remarked that there has been less important architectural work completed in Oxford during the last few years than, say, during the decade 1880 to 1890; and dealing as we are merely with exterior design, there is not a great deal to be noted.

The only important church recently erected is that of St. John, Cowley, designed by Mr. Bodley; and the broad low western tower is not quite completed, a tower in which the newel stair is placed in the centre of the western wall, and which is of almost unbroken severity until the belfry stage is reached. The exterior walls of the church are faced with ashlar; those of the nave aisles are windowless and are interrupted only by widely-spaced flying buttresses. As the church is covered with a barrel ceiling and roof of wood, these buttresses have merely to counteract the pressure of the stone transverse arches which divide the roof of the nave into two portions and also separate it from the chancel. Mr. Bodley appears to have borne this in mind in designing the buttresses, which could scarcely withstand the pressure of a stone vault. The effect is logical, but meagre to eyes accustomed to buttresses with a greater function and greater consequent bulk. The



SOLDIERS' MONUMENT IN THE QUEEN STREET GARDEN, OXFORD.

architect has given us the long level unbroken ridge which he loves, and which in his hands is always so effective. Behind the church, and connected with it by a cloister, are other buildings lately completed at a cost of £14,000, but too shut in by houses to have any effect upon the appearance of the neighbourhood.

About half-way between this church and the workhouse are new Board schools designed by Mr. Leonard Stokes (see centre plate). They consist of three blocks irregularly disposed upon a spacious site and enclosed by a well-designed iron railing. Each building is characterised by reposeful outline and quietness of detail, the architectural effect largely depending upon the carefully considered coursing of the two varieties of bricks (red and picked yellow stocks) and the carrying up of the angles of the buildings as flanking piers to the gables. This necessitates some expense in the formation of gutters, but certainly gives pleasing character to the design. A bell-turret surmounted by a heraldic vane gives pre-eminence to the principal block, which, however, lacks at present one wing.

The Cowley Road in enlivened by an addition to the Nazareth House (Mr. Goldie, architect) and a quaint tavern, the Elm Tree Inn, a low building with stone mullioned windows set in rough-casted walls.

Where the three roads converge at the Plain is a Jubilee drinking-fountain, which, with its steep stone-slated roof resting on eight columns, its clock and weather-vane, looks very much like a seventeenth-century market cross. It bears the motto—

LYMPHA CADIT, RUIT HORA, SAGAX BIBE
CARPE FUGACEM,

which has been recently rendered by an old graduate:—

> "The water falls, the hour swiftly flies
> Drink one, and seize the other e'er it dies,
> If thou art wise"

The bridge crossed, we note the careful restoration of Magdalen old buildings, where Mr. Bodley has respected the ragwort growing on the walls, and the new tower and quadrangle to the west, which, in spite or their freshness, date mainly from 1882–4. In the High, at the corner of King Street, is the "Eastgate" hotel, with painted wall-sign. The elevations are of rock-faced stone below and rough-cast above, with a roof of pearly-grey slates. Nearly opposite is a new block of shops and lodgings, the five gables and dark mullioned windows of which well preserve the character of the street at this point. Both of these blocks were designed by Mr. E. Prioleau Warren as architect to Magdalen College.

A little further west, at the corner of Logic Lane, is an extension of University Hall, comprising several sets of students' rooms (see p. 6). The elevation towards the High is faced with Box Ground stone, and is of the traditional collegiate character, the only unusual features being the arcaded treatment and angle shafts of the ground storey. The roof is covered with stone slates and broken by gables and dormers. The architect is Mr. H. W. Moore, of Oxford.

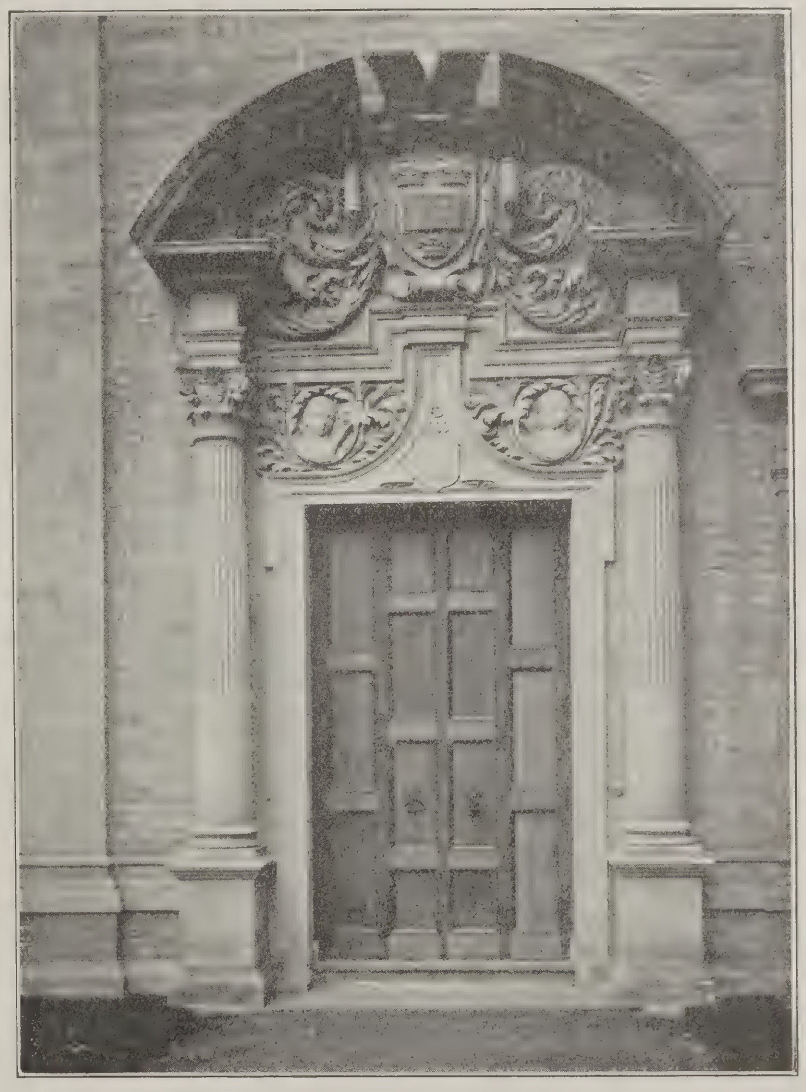
Turning up Queen's Lane, and so into New College, we see the extensive restorations by Mr. Basil Champneys and his completion of the new block towards Holywell Street (see p. 4). Sir Gilbert Scott's portions of these buildings, erected a quarter of a century since, were regarded as excellent specimens of collegiate architecture, but most critics will admit that the recent work is superior. As viewed from the gardens of the college Scott's range has the advantage of standing on higher ground, while Champneys's work appears sunk, yet the latter possesses greater dignity, perhaps due to its simpler outline. Scott's building is capriciously broken up on plan and in elevation, and seems to lack both subordination of one feature to another and continuity of design, in spite of the sameness of materials. Champneys's varied detail renders his work more interesting in spite of the simplicity of the main lines of his design. The Holywell Street elevation is rather more broken up than those towards the gardens, but is almost as charming. The oblong entrance-tower is of greater bulk and height than any other of the college gateways, and contains four lofty floors above the vaulted archway. The whole of these new buildings are faced with a warm cream-tinted stone.

Opposite Manchester College is a large stone-faced private house of which the deeply splayed entrance porch, the traceried windows of the hall and the bold external chimney are the chief points of interest.

Mansfield College has just added unto itself a lodge, presumably from the designs of Mr. Champneys, who, it will be remembered, was architect for the main structure. The pleasing stone of walls and roof and the treatment of the staircase are the chief elements of beauty here—the large area of dormer cheek certainly detracts somewhat from the total effect.

Around the Museum three new structures have been lately completed, scarcely less in harmony with each other than with the Museum itself. To design a series of scientific laboratories is a most difficult problem from an æsthetic standpoint, especially as an adjunct to a building of mediæval character. The architects have ignored entirely this latter consideration, and have given us in one case a commonplace structure devoid of all expression, and in another an unassuming block with distinct Renaissance feeling in the elevations.

The third building, the new Radcliffe Library, although an inseparable foreground to the Museum as generally approached, is also of a Renaissance character, but with a slight, very slight, admixture of Gothic feeling in the sets-off of the buttresses and in the treatment of the windows. Probably a steep gabled roof with a louvre or flêche, such as surmounts the library of Lambeth Palace, would have helped to harmonize the structure with its Gothic neighbour and not have detracted from its appearance when judged apart. The doorway is as dignified as it could well be, considering the threshold is almost level with the lawn; the carving above is rich and vigorous, and the doors themselves are enriched with fine hinges and furniture.

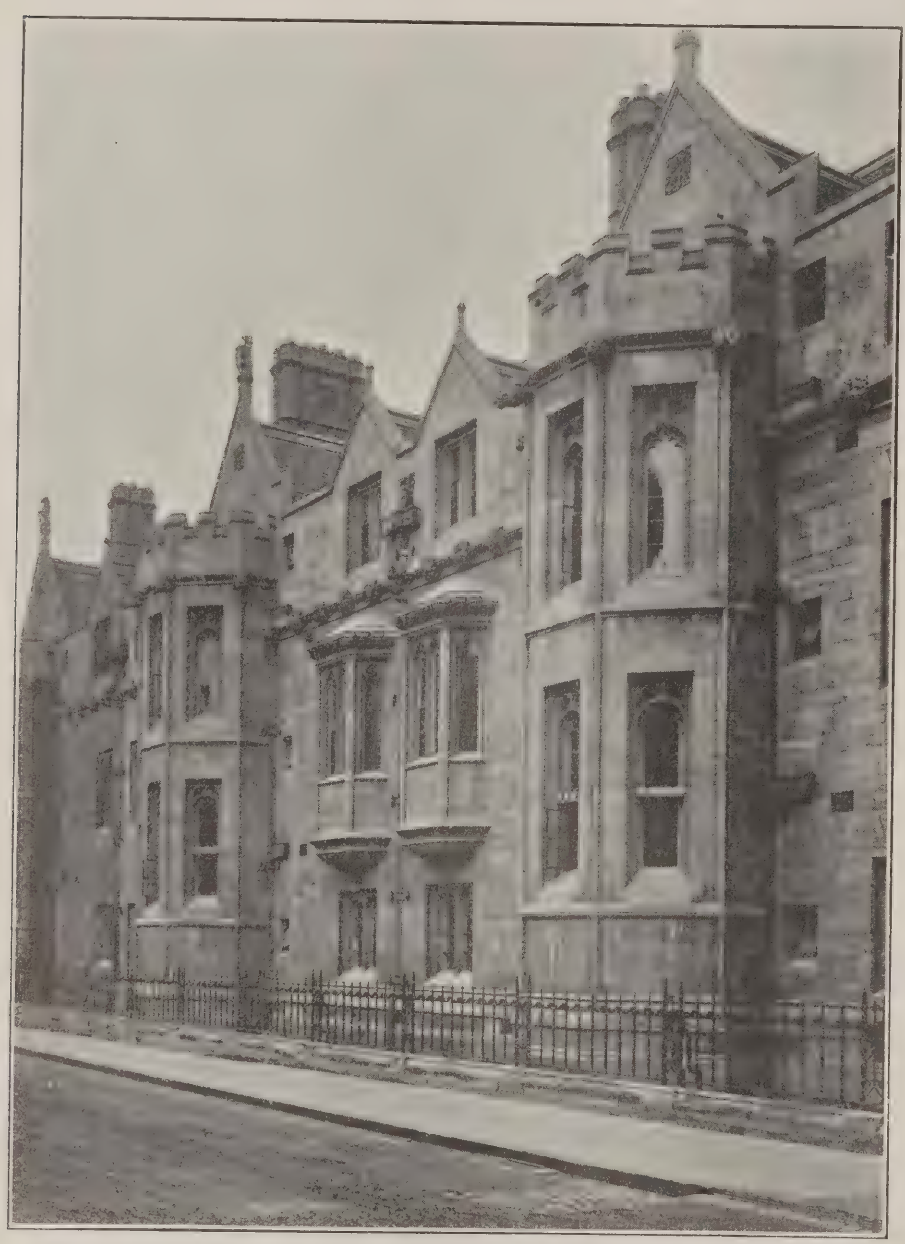


ENTRANCE TO NEW RADCLIFFE LIBRARY, OXFORD. T. G. JACKSON, R.A., ARCHITECT.

In designing the recent additions to St. John's College towards St. Giles Street Mr. E. Prioleau Warren has modestly followed the detail of Sir Gilbert Scott's work, even to the rather strange relieving arches over the windows and the lions' heads upon the wall; only in the carving is there variation, and in the end bay, where a gable and oriel window terminate the block. The architect has treated his predecessor's work with a studied reverence which has been entirely lacking in the case of the Museum additions to which reference has been made.

Street-widening at Carfax had become imperative, and the city authorities were careful that artistic considerations should not be ignored in the new frontage lines and elevations. The conscious aiming at picturesque effect is, if anything, too apparent; but after looking at the recently completed

Lloyd's Bank close by, one feels grateful that the Carfax improvements were confided to so able a man as Mr. Henry T. Hare.



NEW COLLEGE, OXFORD: NEW BUILDINGS TOWARDS HOLYWELL STREET.
BASIL CHAMPNEYS, M.A., ARCHITECT.

In many towns the erection of a Board school prefaces the depreciation of neighbouring property and the architectural decline of the locality; but this can hardly be the case at Oxford. Two new Board schools designed by Mr. Leonard Stokes lie west of Carfax. The Central Schools on Gloucester Green occupy a triangular site most happily; the various blocks group themselves charmingly from all points of view. The small mullioned windows towards the Green are those of the cloak and other subsidiary rooms, the classrooms being lit by large windows overlooking the playground. The walls are mainly of red bricks, and the roofs are covered with large thick yellow stone slabs. Over the main entrance are shallow carvings in the stone panelling illustrating King Alfred and St. Frideswide teaching boys and girls respectively. A school for girls in New Inn Hall Street is more formal in its plan; the building is recessed from the street by the depth of its end return wings, and a handsome cast-iron railing encloses the forecourt, which is below street level (see p. 6). Above the ground-floor classrooms is a boldly projecting cornice supported on shallow modillions. The skyline of the roof is pleasantly broken by a bell-turret.

Among other recent erections, but of less architectural interest, are the Corn Exchange and Fire Station in George Lane, a monument to fallen soldiers in the public garden in Queen Street, the Old White House Inn across Folly Bridge, and Holywell Mill on the Cherwell, rebuilt as a small residence with sluices below. Additions are being made which will carry Hertford College up to the Indian Institute and so eliminate the remnant of private property in Catherine Street. But there is a slackening in the extension of University Buildings; nor is this surprising when it is considered what great additions have been made to the colleges during the past half century and the recent extension of the University system in other cities. The new work at Magdalen, New and St. John's Colleges is probably equal to any of its kind that preceded it; and it may be hoped that, as a result of Mr. Rhodes's bequest, Oriel will soon put as fine a front upon the High as Brasenose commenced in 1888.

We know that across the Atlantic, in California and elsewhere, avenues of University buildings are under contemplation, and even in a course of formation; that our cousins are attempting to do in a century what we have accomplished in ten. No one can begrudge this multiplication of beautiful groups of buildings, but it is pleasant to think that our own ancient centres of education show no signs of that stagnation which is death.

CONTINENTAL NEWS AND OPINIONS.

[The following extracts have been translated for THE BUILDERS' JOURNAL from the German, French, Italian and Russian press.]

The Simplon Tunnel Exhibition.

The Italians will celebrate the opening of the Simplon Tunnel in the year 1905 by holding an exhibition in Milan, and they are inviting sketches and plans for the buildings and general arrangement to be sent in by March 31st next. Two prizes are offered for the first and second best designs—5,000 lire the one and 2,000 lire the other. All further particulars may be had on application to the Exhibition Committee of the Milan Chamber of Commerce.

Laaser Marble.

The "Deutsche Bauzeitung," writing of Laaser marble, says that for open building work it is gaining greatly in favour. It has no sand-flaws, but it has a fine yellow-white ground colour, in which respect it is uniform. It is large, crystalline, like the Lichnitas of Paros, resists the weather, and in the course of time takes on a fine ivory-toned incrustation. Compared with the Italian marble the colour becomes warmer year by year. Its fault is that large pieces show certain dark cloudy spots. Work done in Laaser marble will stand in the open for 800 years without showing the slightest sign of weathering. Large monuments can be produced in it which had hitherto, on account of their size, to be produced in bronze. For monuments, marble lining, stairs and tombstones there is scarcely a marble existing that weathers so well as Laaser marble.

An Armoured Concrete Bridge.

The "Deutsche Bauzeitung" gives a detailed description, with illustrations, of a bridge in armoured concrete that has been carried over a railway in the neighbourhood of Pommeron, on the Coblenz-Trier line. It replaces an old wooden bridge and has a clear span of 17 metres 20 centimetres.

Armed Cement.

The important advance that has been made in the use of armed cement in France for building purposes can be gathered from the yearly statement of work executed on the most popular system in that country—the Hennebique. The value of the work done on that principle has risen from 0·16 million francs in 1892 to 29 millions in 1900, and the number of workmen engaged in the business has risen in the same time from 70 to 9,800.—(From "Stahl u. Eisen.")

Railway Sleepers in Armed Cement.

The Italian paper, the "Genio Civil," says that railway sleepers in armed cement have been on trial in Italy for a long time, and have borne the trial with complete success. They are likely to be generally adopted. The bottom of these sleepers is somewhat broader than the top.

A Curious Instance of Endomorphism.

A letter from M. Lacrois says that certain cases of endomorphism have been observed at S. Pierre. These have been particularly found in the ruins of an iron merchant's establishment in the town. The building had collapsed, engulfing in its ruins a large quantity of iron goods and combustible material of various kinds. Eight days after the disaster the ruins were still smoking. Investigation there discovered a compact rocky mass on the spot of the old warehouse. It is a black silicated rock in which are embedded chains, grids, bars, wire, masses of nails, vices and numerous other articles. They are not fused, but are more or less transformed into black crystalline oxide and have preserved their shapes. Where the silicated rock stops, there are stalactites in all the cavities, particularly across or along the chains. On the edges of this mass there are more or less fused building stones. ("Revue Industrielle.")

Underestimated.

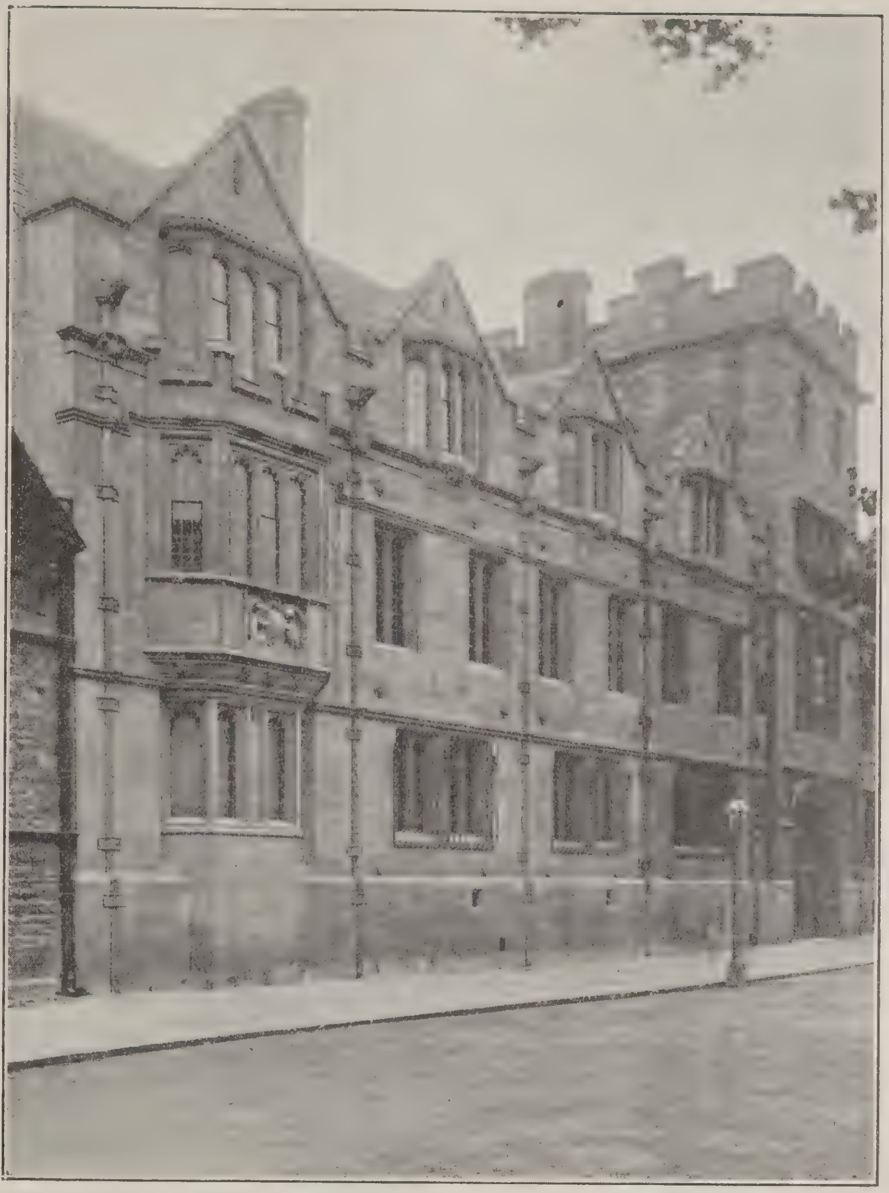
According to the "Schweitzerische Bauzeitung" a serious mistake has been made in the estimates for the Basel council-chamber, which were originally put at one million and thirty thousand francs. A few days ago the ever-deeply-interested community witnessed the voting of the latest of several extras amounting to 486,000 francs, which makes the total cost up to date 2,294,329 francs.

A Judicial Award to a Belgian Architect.

"L'Architecture Moderne" relates that a Brussels tribunal has awarded to an architect the sum of fifty thousand francs for his services in connection with the plans of an Ostend Hotel estimated to cost 4,000,000 francs. He claimed 80,000 francs and had been offered 25,000 francs. The court took into account not only the proportions of the proposed building, but also the high reputation of the architect. "L'Architecture Moderne" says that such a sum, even if it is only 1·25 per cent. of the estimated cost, is far in excess of any fee ever awarded to a French architect for a building that had not been constructed, as was the case here.

Cement and Stucco Facing.

The "Deutsche Bauzeitung" calls attention to a special feature in connection with Munich buildings, which has excited the admiration of many German architects who have visited the town in order to take note of its appearance. It is the special coating of plaster and its application which so distinguishes the buildings of the Munich of to-day, and this has led the writer who describes it to give a history of cement and plaster from the days of the Greeks and Romans. The Romans, he says, generally applied three layers of lime and sand mortar, and on the top of this they added a coating of marble-dust wash. The total thickness would be from 1 to 2 centimetres. The stucco that came into fashion consisted of a mixture of lime and gypsum, with the addition of marble-dust. It was common with the Greeks and the Romans, in the earliest Christian buildings, and was in use amongst the Mohammedans since the year 700, with the French since the year 1000, and with the Germans since the year 1100. Its use decreased considerably in the Middle Ages, but increased with the Renaissance. He traces the story of cement from century to century, showing the different applications for inside and outside work, noting, however, the result of carelessness in its use in the form of the cracks which admit moisture, especially in outside walls, and which of course become great rents through the action of frost. He gives particular instructions as to the making and application of plaster. It is important in applying stucco not to put it upon an existing stucco surface, but always on the naked wall, after carefully scraping it and cleaning out the joints.



ST. JOHN'S COLLEGE, OXFORD: NEW FRONT TOWARDS ST. GILES STREET.
E. P. WARREN, ARCHITECT.

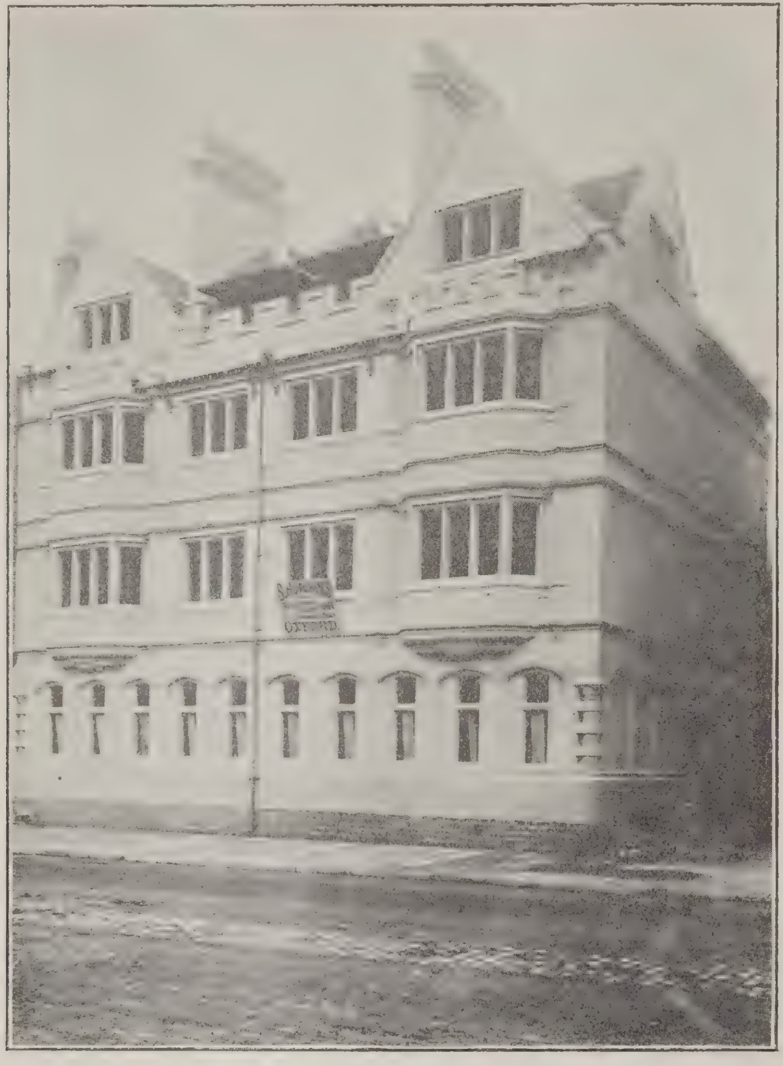
NEW COLLEGE, OXFORD: UNDER THE NORTH OWER. BASIL CHAMPNEYS, M.A., ARCHITECT.

Japanese House-Building.

Mr. F. Baltzar, who has been attached to the Japanese Imperial Railway Service for some time, specially deputed to that work by the Imperial German Government, has felt compelled to examine carefully the question of Japanese architecture, and he forwards the results of his very interesting investigations to the "Zeitschrift fur Bauwesen," which publishes the same in its last issue with numerous instructive and most interesting illustrations. *Inter alia*, he says, the first impression of the Japanese house on the foreigner in the land of the "Rising Sun," from a superficial observation, is one of smallness, unimportance and unattractiveness. In that country wooden houses play by far the largest part. The small solid-clay or stone house is mostly used for shops or stores, and, as far as dwellings are concerned, almost entirely for the wealthy. As a rule each Japanese family will occupy a separate house, and the average number of occupants of a house in the capital town, Tokio, is within a fraction of five; and the writer adds in parentheses, "This compares with twenty-nine in Germany." In the open country, on the other hand, the average number of occupants is a little higher. He then gives a table to show the number of houses and the relative number of inhabitants per house for several Japanese towns, and again for the whole of Japan, in the year 1898, as follows:—

	Population.	No. of Houses.	No. per House.
Tokio - -	1,425,336	303,791	4·7
Kioto - -	337,461	68,339	5 2
Osaka - -	811,855	153,772	5·3
All Japan - -	45,149,587	7,056,038	5·4

Both in the towns and in the country the single-family house and the single-storey house prevail. In large towns like Tokio, Osaka, Nayoga and Kioto there are several tenement-houses to accommodate a number of families; but these have only come into existence since the Restoration in 1868, and are still very exceptional.



UNIVERSITY HALL, OXFORD: NEW FRONT TOWARDS THE HIGH STREET. H. W. MOORE, ARCHITECT.

A Japanese town as a whole exhibits a large number of single houses. As a matter of fact, a Japanese house, seen from the outside, presents a dirty grey colour and a very soiled appearance (excepting when it is new), for it is always left unpainted and the bare woodwork is exposed to the sun, dust and rain. To the non-inquisitive eye one house appears very much like another, and one seeks in vain for the variety that strikes the eye with so much satisfaction in a European town. The low, common one-storey house made of wood, without attics or cellars, has no chimney to mark a break in the roof-line, in contrast with the appearance of European houses. The glazed windows and doors to which we are accustomed in Europe are also wanting. In fact, the whole general appearance seems to throw discouragement on the architectural idea. Still the roof is an exception. When this is not made of straw or shingle, but with tiles, it produces with the aid of the bright white cement with which the tiles are joined a very striking relief. The effect is pleasing to the eye, even more so than the appearance of our own roofs at home. The structural peculiarities of the Japanese house are very interesting, and claim close attention on the part of the student of architecture.

To Illustrate Belgian Architecture.

The King of the Belgians has given instructions to extend and construct a façade of the Congo Museum at Tervueren, Belgium, on account of the rapid development of the institution, and he is anxious that the building should be typical of contemporary Belgian architecture.

Bricks and Mortar.

Aphorism for the Week.

There can be no Art without encouragement. On the lonely islands of the Pacific Mozart and Raphael would have been mere clodhoppers. —ROBERT SCHUMANN.

Exeter Cathedral: Proposed Removal of the West Window. IT is proposed to take down the glass in the great west window of Exeter Cathedral and replace it with other glass as a memorial to the late Archbishop Temple. Mr. Stuart A. Moore, F.S.A., greatly resents this proposal. The glass, he says, "is the best work of William Peckitt, of York, the glass painter, who did his best with the materials at his hand to keep alive the art of glass-painting in England. In doing so he did what scarcely any modern glass-painters have done—that is, he considered the necessities of the lighting of the building and subordinated his window to the intention and design of the original architect by erecting a light-giving, but decorative, window which allows the full effect of the beautiful groining and decorated columns of the cathedral to be seen. . . . . When the cathedral was restored by Sir Gilbert Scott the authorities nearly persuaded him to remove the great east window with its ancient glass, which is one of the glories of the place, and to replace it by a wheel window of his own design; but I showed him the entry in the records which ordered the erection of the perpendicular window, and showed its date, and he thereupon declared that nothing should induce him to alter a piece of dated work, and the window was saved. The Freeman memorial window in the south chapel would have been swept away but for the protests of the late Archdeacon Freeman and myself. It is the most perfect piece of decorated glass in England. I found in a loft above the minstrels' gallery almost the whole of one of the original clearstory windows of beautiful grisaille work and ample remains to ensure its perfect restoration. I offered to restore it on condition that I might employ my own glass-painter, but this was refused, and I now hear that the window has disappeared altogether. I have vainly endeavoured to get the authorities to have drawings made of the original designs of the side windows in the choir but without success, and very unsuitable windows have been erected in their place. To take out the glass of the west window would be the worst possible way of erecting a memorial to Archbishop Temple. . . . ." Mr. Lewis Day, in his book on stained and painted glass, writing of the low level of the seventeenth-century glass, says: "That it could fall still lower was shown, for example, by Peckitt, of York, who is responsible for the glass on the north side of New College Chapel, Oxford."

A Horse's Tail. Mr. D. S. MACCOLL and Mr. Spielmann, the two art critics who have been the centres of the respective parties in the Wellington Memorial controversy, have made some caustic remarks about each other's opinions. Mr. Spielmann threw doubts on the authenticity of Stevens's model. He then gave as "authoritative information" the fact that the model was the work of Stevens's own hands, "except the tail, which Mr. James Gamble, his assistant, put into plaster, and Mr. Keats, Stevens's handy man, fixed on. This is the portion which Mr. MacColl claimed to be a superb feature." But Mr. MacColl upsets that assertion. He says: "The tail of the full-sized model is obviously a mere stump, and not Stevens's; and it was pointed out that this was one of the imperfect parts, but could be supplied, fortunately, from the sketch-model at Kensington, with which Mr. Spielmann has yet, perhaps, to make acquaintance. In that sketch-model the treatment of the tail, as all who know it will admit, is, indeed, superb." Mr. Gamble himself says: "No, no. Charge Mr. Tweed with the rectifying of the tail, which was the only part left in clay unfinished, and with supervising power to see that the bronze work from the existing model of the mounted horse is sound and faithful in all respects. Beyond this there is nothing to be done."

Corner Sites. A MEETING of the Associate Section of the Edinburgh Architectural Association was held on Wednesday last, Mr. J. Douglas Trail occupying the chair. Mr. J. A. Arnott gave some "Notes on the Treatment of Corner Sites." In arranging the plan a considerable amount of trouble was sometimes experienced in obtaining a sufficient amount of light to a number of rooms, &c., and also in giving pleasing shapes to many apartments. The difficulties associated with the elevation were due partly to the necessity for a truncation of the angle, and partly to the opportunity offered for introducing a prominent feature in the design. One difficulty was to treat the angle so that the lack of basement to the design might not be too apparent—this might be done by abstaining from giving to the corner a pronounced vertical appearance. The horizontal mouldings would be continued round the corner. The lecturer showed slides illustrating his remarks, and pointed out that the turret roof was a useful finish in that it concealed any awkward intersections of the main roof.

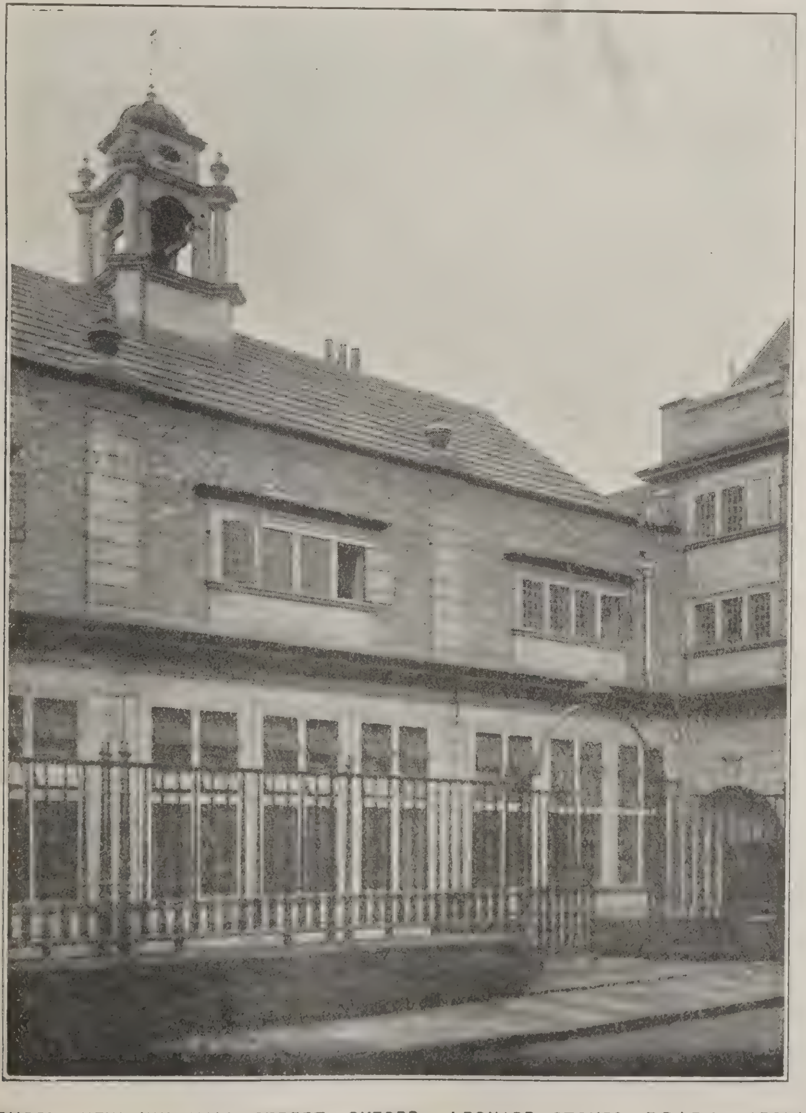
LEEDS AND YORKSHIRE ARCHITECTS.

Annual Dinner.

THE annual dinner of the Leeds and Yorkshire Architectural Society was held on Thursday last. The president (Mr. Butler Wilson) occupied the chair. Dr. Bodington gave the toast of "The Royal Institute of British Architects." Mr. John Belcher, A.R.A., in replying said that the Institute might be said to be the representative body of British architects throughout the Empire. The more thoroughly architects co-operated with the Institute in maintaining the status and integrity of the profession the more effectually would its status be safeguarded and the art be advanced. There were, he continued, other things which conduced to health than a proper system of drainage, and he thought the authorities should not only take precautions against contamination through the senses of smell, taste and feeling, but should also be careful that nothing be received through the eye or ear which was corrupt, coarse or vicious. There was much to be said in favour of a Minister of Fine Art, under whom some general supervision might be wisely exercised over all that was to be presented to the public eye. "In the meantime we must, as architects, remember our responsibilities. We must protect and lead the public taste, and we must resist as strongly as possible such insidious, enervating and unwholesome forces as are affected by what are known abroad as *les nouveaux*, and we must endeavour to encourage pure, simple and manly methods which belong to a healthy British tradition."

In responding to the toast of "The Houses of Parliament" Mr. Rowland Barran, M.P., said that though painters' water-colours might fade after 150 years, and oil paintings be limited to a few centuries, there was in architecture an art and a science which lasted almost as long as the solid fabric of the earth itself. There were to-day buildings which dated back beyond all written history. In that there seemed to be room for a natural envy. He did not mean it to be supposed by that that a building put up, say, in Leeds, under the building by-laws, and complying with all their specifications, was likely to last till eternity. God forbid that many of them should do anything of the kind. "In a city like Leeds," Mr. Barran continued, "questions of utility must take the first place, and it is, therefore, a very difficult thing for an architect to erect any building which can correctly be described as belonging to a high class of architecture, or to claim any amount of beauty. We have in Leeds, however, a growing number of buildings which have some claim to art. I often think that in these smoke-begrimed cities, if we could pay rather less attention to the ornamentation of our buildings and more attention to the proportions, we should achieve more architectural success than we do at the present time."

The Mayor of Harrogate (Mr. Horace Milling) gave the toast of the Society, and remarked that it was one of the oldest provincial societies in existence, having been founded in 1877. He was pleased to see they were also a prosperous body, as during the past year their income exceeded their expenditure by £96, while their membership had increased from 118 in 1901 to 124 in 1902 and 137 in the present year. The President, in responding, said the area covered by the Society extended from Teesdale in the north to Huddersfield in the south, from a considerable distance in the west to Flamborough in the east. They had instituted a system of education for the associates of their Society, and they had ventured to name it a School of Architecture. Although at present it might exist only in name, they hoped in the near future to make it a reality. They hoped to make Leeds prominent as the metropolis of the North so far as architecture was concerned. He regretted that the old universities, such as Oxford, which owed so much to architecture, offered no rewards to the architectural student, but he hoped the time was not far distant when a degree of architecture would be offered by these ancient seats of learning. In the meantime it had been left to the newer universities, such as the Victoria University, to take the first step, and he hoped before long that at the Yorkshire College they would have a chair of architecture.



GIRLS' SCHOOL, NEW INN HALL STREET OXFORD. LEONARD STOKES, F.R.I.B.A., ARCHITECT.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Public Stands.

J. L. D. writes: "Kindly give a detail section with dimensions for a twenty-tier timber spectators' stand to a ball court."

See an article on the Construction of Stands in our issues for June 9th and 16th, 1897.

Drawing Entasis on Columns.

SALFORD.—G. E. C. writes: "Which is the most accurate method of getting the entasis on a column 7ft. 9in. long with the beam and slot?"

See p. 393 of our issue for January 24th, 1900.

Fixtures in Houses.

LICHFIELD.—H. C. writes: "I have fixed an oak mantelpiece and overmantel in a house (not the occupier's property), and I want to know if it can be removed if desired at any time. Is it a 'tenant's fixture'? It has a framed ground of deal, screwed to plugs, and the oak joinery screwed to the ground. I have been told that only the oak could be removed."

Even the framed ground, being screwed and not railed or otherwise permanently attached to the freehold, is a tenant's fixture and can be removed. This is my belief, but if there be doubt a solicitor should be consulted. G. A. T. M.

Slating.

SWANSEA.—J. R. writes: "(1) What are the characteristics of the Cumberland and Westmorland, American and Belgium green slates? (2) How does the cost per square on roof vary when the size is entirely Countess, and how does it differ when laid in diminishing courses? (3) Have Belgian slates been extensively used for church work in Britain, and have they proved satisfactory?"

(1) See the "Slater" section in "Specification, No. 6." (2) The cost per square when laid to a 3in. lap is about 1s. less for Duchesses than Countesses and 3s. less for Ladies. There is practically no difference, however, in cost when the price of the different sized slates is taken into consideration. The extra labour entailed in laying diminishing courses works out at about 10s. per. square. (3) Belgian slates have only been used to a small extent in this country, and have proved very unsatisfactory.

Lead on Oak.

J. M. C. writes: "Have you ever known lead casing (sheet or pipe) to dissolve to a powder after being in contact with oak?"

We have never heard of this occurring, and do not see how it could happen.

Study of Old Buildings.

LINCOLN. — LUDA writes: "Could you oblige me by giving me some advice on the study of famous buildings (as Lincoln Cathedral)?"

See Mr. W. H. Bidlake's paper on the study and delineation of old buildings, read before the Architectural Association on December 19th, 1902, and reported in our issue for December 24th. Study also "A History of the Gothic Art in England," by Edward S. Prior (George Bell & Sons, York Street, Covent Garden, W.C.), and Reginald Blomfield's "Short History of Renaissance Architecture in England."

Extras.

ABERGWYNFY.—CYMRO writes: "(1) According to the contract plans for four houses, the depth of the foundations were shown about 1ft. below the surface. The ground being 'boggy,' I dug down another 3ft. to reach the solid ground. Can I claim for the extra labour and materials? (2) After building three pine-ends (party-walls) on the second floor in 4½in. brickwork, 27ft. long by 5ft. high, the architect ordered me to pull the work down again and rebuild the ends in stonework 21in. thick. Can I claim for the loss of labour and materials by pulling the work down, and the extra labour and materials by building the walls in stonework? The contract form was issued by the R.I.B.A. and master-builders."

Upon the facts *as stated* in your enquiry we are of opinion that you can claim for both works.

Sanitary Walling.

POLLOKSHIELDS.—W. F. writes: "What are the relative merits of the following walls for dwelling-house purposes—particularly from strength, sanitary and health points of view, also as to heat and cold:—(1) 14in. solid good common brick, built in lime and plastered inside, the outside cement rough-cast and rendered quite waterproof with paint or other coating; (2) a similar wall, without waterproof coat on outside, but having the inside of wall battened and lathed; (3) hollow wall, 9in. by 4½in. walls, tied together with iron ties plastered inside, and cement rough-cast outside (no paint); (4) thin wall, outside as above. All walls to have a damp-proof course."

A waterproof wall is not considered so healthy as a slightly porous wall, on account of the passage of air being prevented and vitiated air being compelled to stagnate within it; on the other hand, a porous but damp wall is cold and not healthy. A hollow wall, with the thick portion inside to carry the weight of floors and roof, and thin part outside to act as a screen against the weather, is decidedly the best of the varieties mentioned, the cavity being properly ventilated. The inner wall must always be the same thickness, as if there were no outer screen. HENRY ADAMS.

Civil Engineers' Examination.

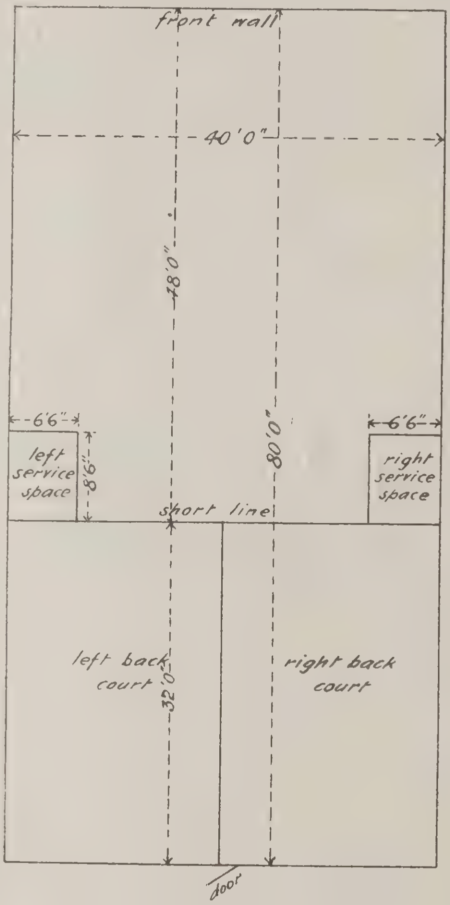
HALIFAX.—UNCERTAIN writes: "Can one enter for the Associate Membership Examination, Institution of Civil Engineers, after one is twenty-one years of age; or is it necessary to wait till one is twenty-five years old? If one is in a civil engineer's office where the principals are not members of the above Institution, will it prevent one from going in for the studentship or the Associate examinations; if so, how?"

The Associate Membership Examination of the Institution of Civil Engineers cannot be taken until the candidate is twenty-five years of age. The candidate need not necessarily be in the office of a member of the Institution so long as he knows some member to stand sponsor for him, but he must produce evidence of a liberal education and professional training as a civil engineer. Application should be made to the secretary of the Institution, 25, Great George Street, S.W., for particulars of the examination and form of application. HENRY ADAMS.

Racquet Courts.

MARKET DRAYTON.—P. C. writes: "Can you give me the names of any books, articles or any other information dealing with the building of racquet courts, and particularly of squash courts?"

We know of no articles or books dealing with the building of racquet courts; but the following information should prove sufficient for requirements. The materials to be used in construction, and especially in that of the roof, must depend largely upon the amount of allowable expenditure and local facilities. From the above plan it will be seen that the dimensions of a "close" court (open courts are now almost obsolete) are 80ft. by 40ft., the walls having a height of 40ft. The *back* wall may be broken at 14ft. above ground level by a gallery for the spectators, umpire and marker. The whole building is roofed, and well provided with skylights or lanterns protected on the inside by wirework to prevent damage from the balls. The walls must all be rendered perfectly smooth and hard with fine cement, so that the balls may rebound evenly, and should be painted black. The best material for the floor is asphalt. In the centre of the back wall, beneath the gallery, is the entrance door, which must be perfectly fitted and left flush with the wall on the inside. On the front wall are drawn two horizontal lines, one 2ft. 3in. above floor level, the other 7ft. 9in. above, the latter being termed the "cut" line. The wall-space from floor to level of lower line is covered with hollow boarding, this serving as a sounding board and enabling the players to know when it is struck by the ball. The sketch given shows the method of floor divisions by lines into the necessary spaces and courts. In India, it may be added, the walls are usually painted white for the sake of coolness, and black balls are used. Here the colours are reversed. A court of the dimensions given above is suitable for four-handed matches; for single matches one of 60ft. by 30ft. is sufficient.



PLAN OF RACQUET COURT.

Licences for making Valuations.

BILSTON.—ENQUIRER writes: "I should be glad to have a reply to the following enquiry. I am called in to survey or value a small property (about £100 value. If I attach a present value, what fee or stamp would be necessary, and is a license as appraiser required? The property really, on the church's sede, consists of a mortgage on a cottage. The church authorities have no ownership of the cottage."

The Stamp Act exempts "appraisements or valuations made for and for the information of one party only, and not in any manner obligatory as between parties either by agreement or operation of the law." Any valuer may therefore make a valuation without holding a licence if it is for the use of his client individually, notwithstanding the fact that the valuation may be subsequently used as the basis of an agreement between parties. The essence of the matter is that the valuation must not be an award made with the object of binding two parties unless properly drawn by a licensed valuer and duly stamped. If the valuation is to be binding between parties the valuer must hold an appraiser's licence costing £2, and renewable on July 5th. The award must be in writing, showing the amount, and must be stamped within fourteen days of making under a penalty of £50, and any person paying for one not properly stamped is liable to a fine of £20. The stamp duties on appraisements are:—

	£	£	s.	d.
Not exceeding	5	0	0	3
,, ,,	10	0	0	6
,, ,,	20	0	1	0
,, ,,	30	0	1	6
,, ,,	50	0	2	6
,, ,,	100	0	5	0
,, ,,	200	0	10	0
,, ,,	500	0	15	0
Above	500	1	0	0
On award the same				
but not exceeding	750	1	0	0
Do. do.	1,000	1	5	0
Above	1,000	1	15	0

The cost of stamps is generally divided between the parties. For the fees payable to surveyors and valuers for making valuations see "Specification, No. 5," p. 51.

HENRY ADAMS.

Power of Rural Council to Enforce the Provision of Eaves-Gutters.

WICKWAR.—J. S. B. writes: "Has a rural district council power under the Public Health Act of 1875 to demand the owners of cottages in a country district to put eaves-gutters to roofs which have never previously been spouted, and can they make the owners repair the roofs and the windows of the cottages? I may say I have written to the sanitary inspector from whom the notices came, and he refers me to section 94 of the Act."

Yes, if the local authority is satisfied that a nuisance is caused by reason of the structural deficiencies or defective construction of a building, they may call upon the owner to make good such deficiencies or defects in order to abate the nuisance thus caused. In the case of buildings which are absolutely unfit for human habitation, the abatement of the nuisance may even involve the pulling down of the premises. T. E. C.

Law Cases.

By-laws.—At the Moot Hall, Newcastle, Robert Harbottle, builder, Walker, was summoned for committing a breach of the by-laws of the Walker Urban District Council. It appeared that Mr. Harbottle, who was carrying out some building operations at Walker, had carried one of his houses to a greater height than the adjoining buildings, contrary to the plans he deposited with the council, and that he had contravened the by-laws by building a portion of the wall to a thickness of 4½in., while the by-law demanded that it should be 9in. thick. --The Bench was satisfied that a breach of the by-laws had been committed, and imposed a fine of £5.

District Surveyor's Fees. — A Chelsea builder named Frederick Robertson was recently summoned at the Westminster Police Court by Mr. W. A. Large, district surveyor for the Belgrave and Pimlico division of St. George's, Hanover Square, for £2 17s. 6d.—fees for surveying drainage work to a building in Grosvenor Gardens.—The defendant said the work had nothing whatever to do with the district surveyor. It was done under the Metropolis Management Act under the purview of the sanitary inspector. All it amounted to was cutting a small hole through a wall for a 4in. pipe to go through. —Mr. Large said another metropolitan magistrate had decided a very similar case in favour of the surveyors. He should have to ask the court for a case.—The magistrate said he was in favour of the defendant, but if the complainant was going to appeal the sanitary inspector's order should be produced. In adjourning the proceedings for this document, he said the defendant would do well to consider whether it would not be much cheaper to pay the surveyor's fees than incur the heavy costs of counsel and solicitors in subsequent litigation.

Altering a Bay Window.—The case of *Wright* v. *Lawson* recently came before the Chancery Division of the High Court of Justice. This was an action by a lessor against a lessee upon a covenant contained in a lease of a house and shop in Fulham. On the first floor of the premises there was a bay window. On June 30th, 1900, the defendant was served with a notice on behalf of the London County Council, under the Building Acts, to take down or otherwise secure the brickwork of the external walls and bay window, so far as it was cracked, bulged, loose or otherwise defective; also to shore up the bay window and arch over the back door immediately. The defendant thereupon instructed his builder to comply with the notice, and the window was taken down; and it being impossible, owing to the house being old and badly built, to re-erect the window in the same way in which it was before without its being condemned as dangerous by the County Council, the defendant built a new window set back in the main wall of the house. The plaintiff by this action asked that the defendant might be ordered to restore the premises to the condition in which they were when the lease was granted by replacing the bay window. The evidence showed that practically a new bay window, such as would satisfy the requirements of the County Council, could only be erected by supporting it by two columns from the ground to the window; or at any rate that supports of a substantial character would be required. Mr. Justice Kekewich came to the conclusion that the defendant was not liable to replace the bay window, since it was impossible to do so consistently with the requirements of the London County Council. He did not think that erecting a new bay window supported by columns could be regarded as the repair of the old bay window. It would be erecting a new bay window of a totally different character, more permanent, better, and more satisfactory, and possessing those qualities because it was new. That appeared to bring the case precisely within the principle of *Lister* v. *Lane* (1893, 2 Q.B., 212). The defendant had been prevented by *vis major* in the shape of the London County Council from performing his covenant. There would be judgment for the defendant with costs.

RUSKIN DRAWINGS.

A MEETING of the Sheffield Society of Architects and Surveyors was held last week, when Mr Gill Parker, curator of the Ruskin Museum, gave a lecture on "Architectural Examples of North France and Italy, as shown by drawings in the Ruskin Museum." Mr. Parker explained that the many drawings in the museum were executed by Mr. Ruskin and the band of artists who worked under his direction on the Continent for the purpose of illustrating the fine work of the mediæval architects, sculptors and masons. Mr. Ruskin, forty years ago, saw the immediate necessity of these records being made, for in many instances decay and careless restoration were working sad havoc with that original work, which must have been always of the greatest import to anyone seriously interested in the arts of architecture and sculpture. Most of the drawings illustrated passages from Ruskin's writings, and not only appealed particularly to his students, but also to all who were familiar with his principal works on architecture—"The Stones of Venice" and "The Seven Lamps of Architecture."

Amongst the illustrations given were those of cathedrals and other edifices in some of the old towns in the north of France, where fine examples of the Gothic of the twelfth and thirteenth centuries had been fairly well preserved up to the time when the drawings were made, including Rouen, Chartes, Amiens, Auxerre, Abbeville and Laon. Attention was then directed to cities in the north of Italy, where Byzantine, Romanesque, Gothic and later styles of architecture might be studied.

Mr. Parker said it must be admitted that Ruskin and his artists had undoubtedly shown in this collection that architectural drawings could be made which were not only accurate, and in some instances included detail carried out to the most delicate minutiæ, but which were also artistically considered fine productions. They were precise, not generalised, yet artistic in the highest sense of the word, and had a beauty and charm entirely their own. The lecturer hoped those present would help in making the value of the collection still further known and appreciated.

THE SOANE MEDALLION PRIZE DESIGN FOR A TOWN CHURCH. BY E. F. REYNOLDS.

The brickwork to be built of bricks 9in. by 4½in. by 1½in. thick, of rough texture and varying in colour. The mortar joints to be ½in. thick, flush, and of white mortar. The stone to be generally of light colour, white varying to grey-green, and set with same thickness of mortar-joints as the brickwork. The slates to be laid random, graduated in size, rough in texture and varying in colour

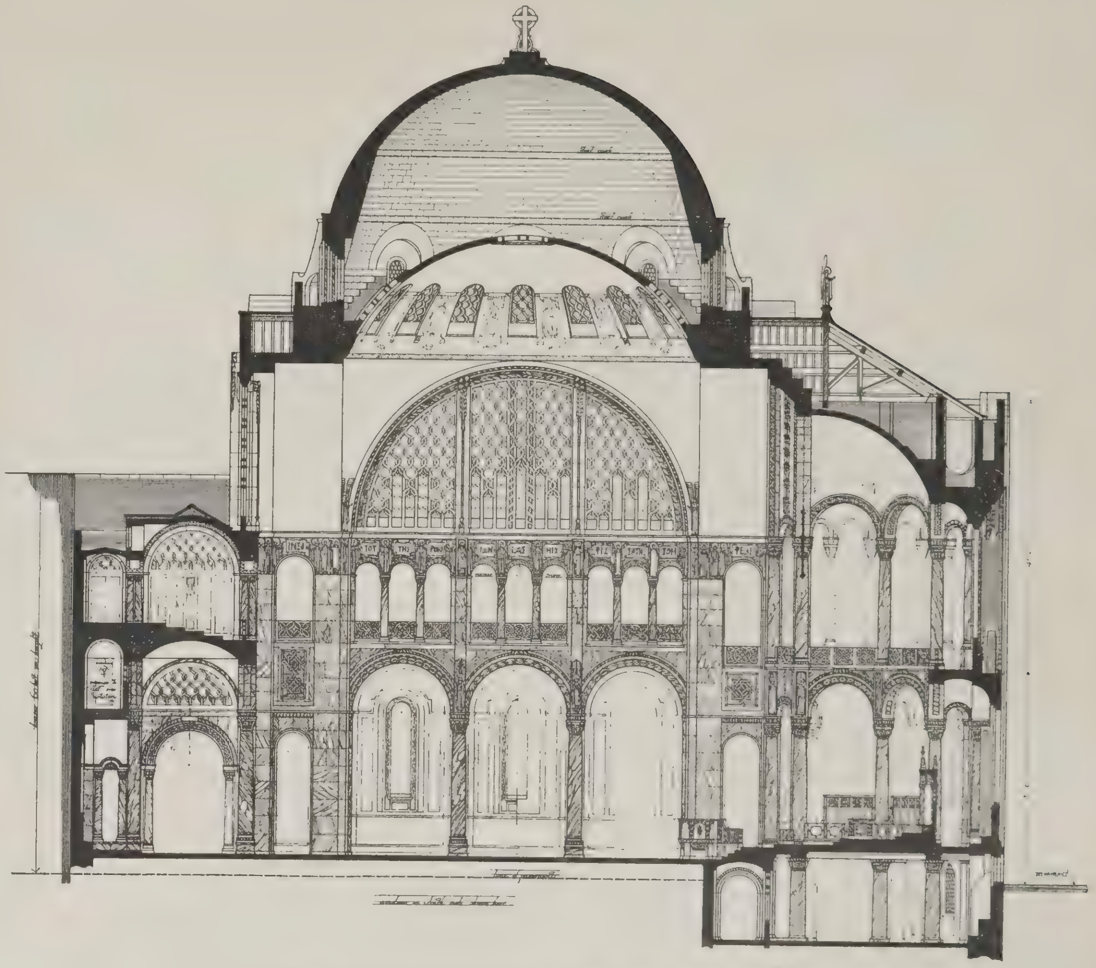
TRANSVERSE SECTION *through Dome*



LONGITUDINAL SECTION *looking towards the North*

THE SOANE MEDALLION PRIZE DESIGN FOR A TOWN CHURCH. BY E. F. REYNOLDS.

The external dome is bound by two curbs, formed of steel girders I bolted together at the angles, at the heights shown on the sections; the lower part of the dome serving as a rigid cone giving abutment to the upper portion. The internal dome is of 9in. brickwork, increasing to 14in. work at the base. The internal walls of dome and aisles are faced with marble slabs up to the general line of springing with the exception of the mosaic frieze under the springing of the dome, and the vaults and domical surfaces are covered with mosaic work. The vaults over chapel, vestry stairs baptistery, and the west entrance spring at a lower level than the main arcades. The spaces between the wooden floors of organ chambers and the upper surfaces of the vaults over chapel and vestry stairs is utilized for the blowing-apparatus and wind trunks of the organs, and also forms an air-chamber beneath the pipes, giving resonance to the tone. The vaults over the north and south aisles are spherical in form, giving no intersection of surfaces.

R.I.B.A.

Mr. Champneys on College Planning.

A MEETING of the Royal Institute of British Architects was held at 9, Conduit Street, W., on Monday evening last, the chair being occupied by the president, Mr. Aston Webb, A.R.A. Mr. Basil Champneys, M.A., read a paper on "The Planning of Collegiate Buildings."

Mr. Champneys said he proposed to deal with such types of collegiate architecture as could be treated by one with such authority as practical experience might justify. Briefly touching upon the archæological aspect of the subject, he referred to the changes of custom which had served to modify the standard set up by the old builders and to the different conditions now to be provided for. When the old buildings were erected students entered on their University careers at a much earlier age than now; the standard of expense, too, was very much lower. Nowadays the University is considered the privilege of the more wealthy; formerly it was designed for all who had sufficient ambition or enterprise, and offered every facility to those who were prepared to face poverty and hardship in the pursuit of mental training. While the change in the age of the students revolutionized the arrangements of rooms, the increased size and scope of the colleges afforded occasion for larger and more comprehensive schemes of planning, and made effective grouping of the buildings possible. The great increase in size opened the way to the development of collegiate planning on an extensive scale, and suggested the type which nearly all existing colleges to some extent illustrate—the grouping of the buildings into one, two or more quadrangles of rather low buildings (in the original colleges there were never more than two floors and an attic), from which the special and more important features, the chapel, the hall and the library, stand out as salient features.

The lodgings of the president, warden, principal or master were usually included in the general grouping, and are seldom distinctive features in the older college buildings. In the present day the head of the college usually requires a more sumptuous abode, which must become an important item in contemporary college architecture; while the fact that many of the tutors and fellows are now married will also serve to complicate the future of collegiate grouping.

For the students' rooms the general arrangement was almost invariably as follows:—A staircase, entered from the quadrangle, led to rooms on either side and, as there were three floors, opened into six sets. This arrangement is usually adhered to in contemporary schemes, and, Mr. Champneys thought, with good reason. In the few cases in which a departure from the ancient type had been attempted the result seemed to be unsatisfactory and destructive of collegiate character. As examples the author cited Mr. Butterfield's buildings at Keble, where it would have been far more satisfactory had the ordinary rooms been planned on the old-established system; the new buildings at New College erected by Sir Gilbert Scott about 1876; and a new group of buildings built by Mr. Bodley at King's College, Cambridge. In both the latter instances the fourth storey, which the author considered subversive of collegiate effect, had been, he believed, forced upon the architects, largely, no doubt, from motives of economy. There was, however, no economy secured by this piling up of buildings. He had tested the comparative cost of buildings of two, three or more storeys, and had found that a building of two storeys, floors of moderate height, was definitely more costly for the same accommodation than one of three; but four or more floors were not more economical than three.

The old system of college planning needed but few modifications to bring it up to date. A few practical requirements consequent on the change of custom have to be met. It is essential that living-room, bedroom and cupboard, or "scout's hole" or "gyp-room," should be independently accessible, though there is some advantage in having a door between the sitting-room and bedroom, as it allows the bedroom to some extent to benefit by the sitting-room fire, and gives the occupant more breathing space at night.

As an example of the most highly developed idea of a mediæval college, the author cited New College at Oxford, which in its ancient form showed a complete design carried out at one time. In order to realize Wykeham's idea it is necessary to remove in imagination certain later additions which have obstructed the original intention. Chief of these is the addition of a storey to the main quadrangle. This raises the buildings to the same level as the gateway tower which originally surmounted them, and also decreases the predominance of the chapel and hall. William of Wykeham was a great Churchman, and his intention was to make the chapel the chief feature of his main quadrangle. The great height and scale still preserves its relative importance, but its predominance over the residential portion of the quadrangle is much hampered by the added storey. The marked predominance of the chapel over the adjoining buildings, the cloister and the tower, are somewhat exceptional features in college architecture, and serve to emphasize the ecclesiastical intention of the founder. The same idea is manifest in a college of modern foundation—Keble—which, as a memorial to a well-known Churchman, was founded with a somewhat similar view. Other colleges which bear the impress of a specially ecclesiastical ideal are Christ Church and Magdalen at Oxford and King's at Cambridge. In the more ordinary type of college the chapel hall, and in many cases the library, are salient features in the grouping, but their relative importance varies very considerably.

A new phase of collegiate life which involves certain modifications of the original type of building is the establishment of colleges for women both at Oxford and Cambridge. Life in these must necessarily be of a more domestic character than in colleges for men and, if the style of architecture follows the requirement, the result will be something which may be called "domestic collegiate." Access to the several students' rooms can no longer be from staircases entereddirect from the open air; the approaches must be properly enclosed and the passages warmed. In the building illustrated by the author—Newnham College at Cambridge—the deviation from the original type is greater, because the system of the college is that of subdivision into halls, each of which is on the whole complete in itself (a reversion, as it happens, to the original arrangement), the only features used equally by the entire college being the great hall and the library, the lecture-rooms and the laboratories. Moreover, the scheme as it now stands has been developed piecemeal; has started from small beginnings and grown up step by step, each instalment of the group of buildings having been supposed, at the time of its erection, to be the last, until the pressure of applicants suggested a further extension.

Another building referred to as deviating from the original type on account of a change of purpose was Mansfield College, which contains all the features of a college without residence for students. It consists of a chapel, a hall and common-rooms, with the requisite offices, bursar's and tutors' rooms, a few bedrooms, several lecture-rooms, a large library and a principal's residence.

In conclusion, the author referred to the most modern type of collegiate arrangement, viz., that designed to meet the requirements of elaborate scientific training. To get an idea of the complicated planning involved in a very moderate portion of these requirements, the author advised his audience to read the papers on "The New Science Laboratories at University College, London," read before the Institute in March, 1894.

DEATH OF MR. F. C. PENROSE.

WE very much regret to announce the death of Mr. F. C. Penrose, M.A., F.R.S., which took place on Sunday afternoon last. The news reaches us at the moment of going to press, and we cannot do better than make use of the brief life-sketch which Mr. Aston Webb gave with so much feeling at the meeting reported on this page. The Council of the Institute, said Mr. Webb, had proposed to approach the Dean and Chapter of St. Paul's so that the remains of their deceased colleague might be interred in the Cathedral, but they had since learned that it was the wish of the family, and had been also of Mr. Penrose himself, that he should be laid by the side of his wife (who had predeceased him by a few days) in the church at Wimbledon near which he lived. The Council would therefore respect these wishes, but hoped that they might see a memorial of some kind in the building on which he bestowed so much time and care. Mr. Penrose was born in 1817, and was therefore in his eighty-fifth year. Only a few weeks ago he gave a paper before the Institute on the evolution of the volute in Greek art—that subject he loved so well. He was articled to Edward Blore, spent twelve months in Messrs. Cubitt's workshops, and afterwards took a most excellent degree at Cambridge—there, too, he rowed for his college. He travelled for three years in Italy and Greece and less important European countries, and came back to start in practice—the choir school in Carter Lane, at the back of the Cathedral, is one of his works. Later he was appointed surveyor to St. Paul's, in succession to Professor Cockerell, and was also one of those who were selected to prepare designs for the alterations to the National Gallery. He was a man of extraordinary scientific and analytical mind, and produced one or two books which will always remain among the classics of architectural literature—notably that dealing with the optical refinements in Athenian buildings, disclosing analyses which had never before been thought of. He was also a student of astronomy—on that subject, too, he produced a book, which led him to consider the orientation of temples; and so it happened that one of the last things to which he devoted his attention was the orientation of the druidical remains of Stonehenge, where he carried out careful researches with Sir Norman Lockyer. As a man, said Mr. Webb, we all respected him and loved him. He had a power of intellect and a simplicity of mind which were the constant admiration of all who came in touch with him. Late in life he occupied the position of president of the Institute, and for many years he had attended the excursions of the Architectural Association, sketching and playing and working with the younger men, ever ready to enter into their zeal and to adapt himself to their mood, but always respected and honoured by them.

A vote of condolence and sympathy with the family was passed—his daughter, Miss Penrose, is principal of Holloway College, and his son a physician of St. George's Hospital. The funeral takes place to-morrow.

We hope in our next issue to give some further particulars of the life and work of this distinguished man whose death we have now to so deeply lament.

BUILDING CONSTRUCTION.—VIII.

By Our Special Contributor.

(Continued from p. 419, No. 417.)

THE drawings of joinery details are sufficiently clear in themselves without elaborate description. The section "through a window" is through the window of a reception-room on the ground floor. It is a common defect in joinery to find that no obvious preparation has been made for the roller blinds which are invariably used for windows. These are usually put up by men who pay very scant respect to the joiner's work. They cut off the upper ends of the window slips, and the work has an untidy careless appearance. The joiner should make the proper and workmanlike preparation for the blind fittings. The blinds should be mounted either on reliable spring rollers, or with the substantial old-fashioned pulley, on which the blind cord is taken up when the blind is drawn down, and which allows the friction to be adjusted so that the blind will remain in any position. The kitchen and servants' bedrooms are furnished with 1in. plain mitre clamped shutters. These, and the scullery, pantry, dairy and store windows, have 1¼in. window boards, nosing and scotia.

SECTION THROUGH WINDOW

In regard to locks and other fastenings, door furniture and hinges, if the student consults any of the elaborate illustrated catalogues he will find a bewildering variety, and he will probably be at some loss to understand the variety of prices. If he specifies these things in any loose easy-going way, for work to be undertaken by contract, he will find that he will get supplied by the contractor with the very cheapest articles that will conform to the letter of the specification. My own practice for these and other things (as water-closets, baths, lavatories, &c., &c.) is to specify for definite goods, and I quote the number, the page and the maker, reserving to myself the right to accept as good an article for the purpose from a different maker: the reference definitely settles the quality. The young practitioner will consult his comfort if he selects definitely certain makes of ironmongery, and keeps to them unless very definite improvements cause him to change. He should study carefully the different kinds of locks, so as to know whether when he adopts a high-priced article it is really worth the money. For latches the straight-key American latch is now much used. A draw-back lock is used for hall doors, because such locks do not require to be opened by a handle from the outside, and the bolt is conveniently retained drawn when the door is left on the latch. For panelled doors mortise-locks are universally used (unless where it may happen that the framing is too thin to allow of a mortise-lock). There is a bewildering variety of handles for such locks and doors, and yet the handle continues to be the weakest point of a door. The best contrivances are expensive. Our common English door handles are badly shaped; a door handle should comfortably fill the hand; the common handle is grasped by the middle finger only; egg-shaped and reeded handles are an improvement, and a further improvement is to have the handle oval both ways. The handle should fit properly to its washer and the door—there should be no play. The common handle slips on a square spindle, and it is held on by a small screw which screws through the neck and enters small drilled sinkings on the spindle; now, first, there is some trouble to get the sinking exactly at the proper place to keep the handle close to the door, and continual use loosens the screw, which gradually unscrews, or the screw in the brass neck gets widened and destroyed. Attempts to fasten the handles to the door itself fail on account of the thinness of the wood which is left between the sides of the lock and the faces of the door. I am of opinion that a satisfactory handle-fastening would result from screwing into the spindle as well as the neck and providing a concealed washer (this washer might be a spring-washer) between the neck of the handle and the ordinary washer to ensure that the handle would not be loose in the door.

Mortise-locks may also be used for framed and filled (framed and staved) doors, but it is usual to have rim-locks for such doors. Rim-locks are fitted to servants' bedrooms, dairy, pantry and kitchen doors: the store has a dead-lock; outside door of fuel, scullery to yard, and yard doors have stock-locks. The w.c.'s have thumb-latches and inside running bolts; the outside w.c. has also a stock-lock; thumb-latches to scullery doors.

Second only to the trouble with door handles is the question of window-fasteners. I do not like brass and iron combinations in window fasteners, yet this is usual.

The student should make up his mind as to the points of a good kitchen range: he should know how it should be set, and he should be able to absolutely direct both the setting of the range and the whole details of the hot-water supply. In answers to the questions set for South Kensington examinations (see our issue for May 14th, 1902) a diagram was given of the setting of a range and of the hot-water supply. With the arrangement there shown the pipe and its contents, say, between the branch to the scullery and the scullery cock gets cold, and it is necessary to let some water run off before hot water is available; the same remark applies to the bath, but in a less degree, because there will be a slight convection of water in the pipe above the cylinder, but very slight, owing to the small bore of the pipe and the cooling influences. Now it is mostly attempted by plumbers to cure this inconvenience by putting the hot-water supply pipe in *circulation*, which means, however it is masked, that the hot-water supply is connected with the cold supply. It should be remembered that the source of supply is the cold-water cistern, and in the arrangement shown a draw-off of hot water does not bring cold water to the boiler but to the bottom of the cylinder: as shown the arrangement is not defective, but it would be improved by disconnecting the cold supply from the cylinder, carrying it directly to the bottom of the boiler, and having a separate pipe reaching not quite so low in the boiler as the cool-water pipe from the boiler to the bottom of the cylinder—that is, there should be three pipes to the boiler. One way of having hot water always at hand would be to jacket the pipes, and the water in the hot-water pipe might also be kept in circulation by connecting it below with the pipe between the cylinder and boiler, carrying a return pipe to each draw-off cock and making use of a three-way cock which would only allow hot water to come: that is, when a cock is put in use at any time the opening of the cock disconnects the circulation. I have never seen this arrangement, and I put it forward as an untried suggestion: it will probably be objected to that it needs a complicated cock, and this question of circulation in a hot-water supply deserves some consideration. If the "hot"-water supply pipe is made to do duty also as a heating pipe one cannot hope to get "hot" water from it at any time at points distant from the cylinder; the system is expected to do two very different things, namely, to deliver heat at definite points and also to heat rooms all along the course of the pipes. The constant draw-off of heat prevents the water ever becoming really hot unless there are a large boiler and large fires kept constantly going. It appears to me that even with the best arrangement the comfort of having lukewarm water issuing instantly from the hot-water cock is an expensive luxury, and as commonly contrived it is perfectly impossible to get *hot* water by gested above. If I adopt the system suggested above I shall carefully jacket the pipe throughout its course. My attention is particularly directed to this matter, because I am just now designing a hot-water supply for a hospital, and it is proposed that it shall also serve for heating the operating room. I shall certainly not attempt to make the apparatus do both duties at the same time. I was called in the other day to advise in a case where a large sum of money had been expended on a hot-water supply, but which it was found, when the job was finished, would yield no hot water. The room behind the kitchen fire is used for drying clothes, and large bore low-pressure pipes had been carried round it; these were connected with the boot-boiler, and it was expected that in addition to this duty of warming a drying-room the boot-boiler would also supply hot water, and for this purpose a large copper cylinder and hot-water pipes were attached to the boiler. It would appear that this subject is very generally misunderstood, but it is one which deserves careful attention both on the part of architects and plumbers.

The student should carefully study ranges and make up his mind to one or two definite kinds. His client, or more likely the wife of his client, will have a special make which has been recommended to her, and in such cases the architect has got to do the best he can; it will probably be a good enough range. With a boot-boiler and a regular hot-water system a side boiler (always a troublesome thing) is not needed, and the range can have a roaster on one side of the fire and an oven on the other side. There is a range which I have used in which a slide is drawn out between the roaster and the fire, so that it is really a roaster and not merely a second oven; there is a hole in the crown through which the meat may be suspended from a bottle-jack which hangs from the plate-rack. I have found this range to be satisfactory. People who use the top plate very much like a range with rising fire-bars, by means of which a shallow fire is kept up to the plate. Some people find it convenient to open the back plate in front of the boot-boiler to allow the fire to be opened on top for broiling, &c. There are numbers of excellent ranges made; I am of course dealing with the requirements of small houses such as I am describing.

There is a great variety of common grates, and if a man has no definite ideas of his own about them it becomes a complicated matter to choose grates on each new occasion. I may say that my ideal grate is a dog-grate set on a tiled hearth in a tiled recess; its back and sides should be of good heavy fire-brick blocks; it should be rectangular in plan and simple in construction. One needs a fairly good drawing chimney for such a grate; the flue should be fairly over the centre of the fire, and the opening should be neatly and regularly gathered to the flue. Such a grate should be economical; the radiation from the firebrick blocks and the reflection from the tiles should throw the heat into the room. Whether we can afford to have dog grates or not, our grates should be movable from their places, and it should be possible to renew their fire-blocks. In some parts it is impossible to prevent workmen building register grates into their places and fixing the mantelpiece in front in such a way that when the worn-out grate has to be renewed the mantelpiece has to be taken down.

The water supply was obtained by building an impounding wall of concrete across a small stream about 300yds. from the house. From this a 2in. cast-iron pipe brought the water to the house; to provide for a proper supply to the boot-boiler a small tank was placed as previously described in the roof. Water was taken directly from the pipe to the water-closet flushing tanks and to the other points of cold-water supply by $\frac{3}{4}$in. alloy pipe (lead alloyed with tin. The water being soft, it is not advisable to use lead pipes, which are attacked by soft water). A very hard water is very troublesome owing to the coating of boilers, but an absolutely soft water has also special objections with it — boilers rust through more rapidly than with hard water. Hot- and cold-water supplies were brought to bathroom and to the pantry and scullery. The cylinder is placed in the linen-room. There is nothing specially to say about the supply cocks; those for the bath and lavatory basin are the ordinary white-metal cocks supplied with the articles; in the pantry and scullery there are brass plug cocks, with lever handles. There are, of course, refinements, and there is much to be said for them—non-conducting handles for hot-water cocks, &c. What has been said about other manufactured articles may be repeated here. Let the young practitioner make up his mind as to his patterns for common substantial work, and let him slowly change as experience will direct him. The elaboration of baths, water-closets, &c., is now very complete, and it is easy to select standard items of this kind. For such things, I have already said, I specify them by their number and catalogue, and I reserve power to accede to a contractor's request if for any reason he has difficulty in obtaining the goods in time, or if he prefers to deal with a different firm, provided the goods are of equal quality. The floor of the bathroom is formed of concrete strengthened with iron joists; it is tiled, and here again I specified a particular pattern from a manufacturer's catalogue; the walls also for 4ft. over the floor are tiled. The soil-pipe is carried out at once to an outside soil-pipe, which is of heavy cast-iron jointed with lead, and this is carried up as a ventilating pipe to a sufficient height and finished above with a domical grating to keep out birds, &c. The drawing does not show the drains properly; they are laid in straight lines, having Armstrong junctions, and in the event of any stoppage they can be sponged out. The bath and lavatory wastes discharge beneath trapped gratings, and the pantry and scullery sinks discharge through grease traps under gratings; these gratings are trapped from the drain which carries soil. The drain is carried direct to the sea.

The yard is floored with concrete and drains to the Lowe's gulley shown in the centre. The w.c.'s. are also floored with concrete. The scullery and kitchen are tiled with red and black tiles laid on a foundation of concrete. The fuel house is floored with cobbles; the porch is tiled with coloured tiles.

Builders' Notes.

The Nottingham Master-Builders' Association held its annual dinner last week, Mr. Henry Vickers presiding.

Newcastle and District Building Trade Employers' Association held its annual meeting last week, when the following officers were elected:—Mr. W. T. Weir, president; Mr. Alexander Pringle and Mr. Stephen Easten vice-presidents.

The London Building Acts Amendment Bill.—At a meeting of the inhabitants and ratepayers of the Ward of Cheap held on Friday last this Bill was held to be arbitrary, impracticable, would occasion serious loss of business to the citizens, and ought to be opposed. It was also agreed that the Corporation should be the authority in the City for carrying out further powers.

London County Council.—At last week's meeting of the Council it was decided that the new street from Holborn to the Strand should be named Kingsway, and the crescent-shape portion connecting with the Strand, Aldwych.—The Housing Committee's estimate of £9,983 for the erection of working-class dwellings to be called Darcy Buildings, London Fields, was approved.—The Main Drainage Committee reported that the experiments in the bacterial treament of sewage and sewage effluent at the Barking and Crossness outfall works were completed some time ago, and, being of opinion that the results of the experiments should be recorded in book-form, they then directed the chemist, Dr. Clowes, in conjunction with Dr. Houston, to collate the information obtained. They recommended that £305 should be expended in printing and binding 2,000 copies of the report.—Sir W. Collins said he understood that the publication of these reports was only to be the forerunner of certain important proposals by the committee in regard to the bacteriological treatment of sewage. Some of the reports presented seemed to show that the effluent after it left the coke-breeze was far from harmless. Indeed, he gathered from some experiments on animals that very serious and fatal results had come from the injection of some of this effluent. He hoped that the Main Drainage Committee would not think that when their report had been published the last word had been said on the subject of the bacteriological treatment of sewage.—After further discussion the recommendation was adopted.

Keystones.

A new Volume of the "Builders' Journal" —Vol. 17—begins with this issue: and it is therefore opportune for subscribers to renew their subscriptions.

The Ipswich and East Suffolk Hospital has been supplied by Messrs. E. H. Shorland and Brother, of Manchester, with their patent Manchester stoves.

A new Congregational Church at Worthing is being built at an estimated cost of £5,500. The work has been entrusted to Messrs. Longley & Son, of Crawley, the architects being Messrs. Spurrell & Murray.

The Bristol Society of Architects held a meeting last week (Mr. Joseph Wood, president, in the chair), when Mr. E. Guy Dawber read a paper on "The Buildings of the Cotswolds."

Ickford Parish Church, near Oxford, which it is proposed to restore in memory of Archbishop Sheldon, is a fine specimen of Early English work of the beginning of the thirteenth century, and has a tower with a "saddle-back" roof.

The new Naval Barracks at Chatham for the accommodation of seamen attached to the depôt at that station are rapidly approaching completion. The buildings occupy the site upon which the convict prison formerly stood.

St. Peter's Roman Catholic Church, Partick, has just been opened. The nave, which is 104ft. long, consists of seven bays, and the chancel is 34ft. long. Red stone has been used throughout the building, which was designed by Messrs Pugin & Pugin, of London.

The new Parish Church of All Saints at Adamsdown, Cardiff, has been formally opened by the Bishop of Llandaff. It provides accommodation for 330 worshippers and has cost £2,500. Messrs. Seddon & Canter were the architects, and Messrs. E. R. Evans Brothers the builders.

Bungalows for South Africa. — Messrs. Boulton & Paul, Ltd., of Norwich, have completed for South Africa a Government order for 150 wooden bungalows to be used as officers' residences. Each is 80ft. long and 22ft. wide, and comprises a drawing-room, dining-room, four bedrooms and bathroom, with a verandah all round. Connected with each main building by a covered way is a kitchen block, with the usual offices and servants' bedroom. The structures are raised 2ft. above the ground, and are supported on ant-proof cast-iron bases.

The Sending-in Days for the Royal Academy have been fixed. Water-colours, miniatures, black and white and architectural drawings, engravings, etchings and all other works shown under glass must be sent to Burlington House on Friday, March 27th. Oil paintings will be received on Saturday March 28th, and Monday, March 30th, and sculpture on Tuesday, March 31st. Works will be received at the Burlington Gardens entrance only between the hours of 7 a.m. and 10 p.m. on the days appointed. Forms and labels will not be ready for issue until March 1st.

York's Ramparts in Danger.—At the annual meeting of the Yorkshire Philosophical Society the proposal now under discussion by the city authorities for "beautifying" the ramparts by planting them and laying them out for walks, preparatory to throwing them open as public playgrounds, was protested against on the grounds that the dangerous state of Clifford's Tower was due to the trees undermining the banks, and that a similar effect might occur with the city walls; large portions of the city walls of Nuremburg, which closely approximated to those of York, having recently fallen down for this very same reason.

Combe Florey Rectory, near Taunton, has been fitted with hot-water heating apparatus by Messrs. John King, Ltd., of Liverpool.

The Architects' Registration Bill is being pushed with zeal by the Society of Architects, who have circularized the profession in support of the movement.

A new Bank for Parr's has been erected in Spring Gardens, Manchester, from designs by Messrs. C. Heathcote & Sons, architects, of Manchester.

The Decoration of the Panthéon Paris.—M. Detaille has been entrusted with a panel for the decoration of the chancel of the Panthéon representing "Le Chant du Départ."

Two Fire Stations for South London are being erected, one at the Vauxhall end of the Albert Embankment and the other in Mitcham Lane, Streatham. The former is being carried out by the Works Department of the London County Council at an estimated cost of £8,450.

The Colney Hatch Fire.—The jury at the inquest in their verdict said the London County Council, the Lunacy Commissioners and the Home Office were greatly to blame for sanctioning the plans of the Annexe, and recommended that all emergency doors should be made to open outwards, and should be opened immediately after sounding the alarm.

The Manchester Society of Architects held a meeting last week, Mr. Mould presiding. Mr. E. Percy Hinde, of Liverpool, read a paper on "Some elementary school buildings." Much, he remarked, was to be said in favour of the one-storey building if the site would permit of its adoption. In the future the average cost of buildings, he thought, would be greater than hitherto.

Skipton Town Hall. — Messrs. Butler Wilson, F.R.I.B.A., and Oglesby, architects, of Leeds and London, have been commissioned to prepare designs for the enlargement of the Town Hall and Council Offices, Skipton, Yorks. The scheme comprises additions to hall, with a new supper-room, the remodelling of the council offices and the provision of a new court-house for the magistrates.

The Architectural Association of Ireland held its fifth technical demonstration at the premises of Messrs. J. & C. McGloughlin, Brunswick Street, Dublin on Thursday, February 12th. The plant for planing, drilling, hammering and punching ironwork was inspected, work being executed for the benefit of the members. Much interest was occasioned by the manufacture of a large hammered iron leaf from the rough plate. The large gates and piers for the Phœnix Park were much admired. After an inspection of the brass finishing and lacquering, a vote of thanks was passed to Mr. J. McGloughlin, whose remarks on the design and treatment of hammered iron were much appreciated.

Obituary.

Mr. Harry Whiting, of the firm of Messrs. R. M. & H. Whiting, builders, of Ospringe, Thanet, died recently at the age of fifty-five years.

Mr. Philip Henry Perrin, builder and contractor, of Bath Road, Calcot, Tilehurst, died on January 28th at the age of fifty-eight years.

Mr. Robert Moore, a well-known Middlesbrough architect, died recently. Mr. Moore had been in business in Middlesbrough as an architect for over thirty years, and most of the large reconstructed hotels in the town are from his designs.

Mr. John Mervyn Wrench, M.I.C.E., chief engineer of the Great Indian Peninsular Railway, died on January 22nd at Bandora, Bombay. As a young man Mr. Wrench was a pupil in the office of Messrs. Bidder & Kinskowski. He began his Indian career as assistant engineer on the Scinde, Punjab and Delhi Railway in 1873, and suggested the utilization of the large stock of worn-out iron rails for building small bridges, whereby a great saving was effected. In 1887 he was employed in the survey and construction of the Indian Midland Railway, where he introduced the further use of old rails for the construction of temporary scaffolding in the erection of the more important bridges.

THE CEMENT TRADE IN 1902.

MESSRS. TULLOCH & CO., brokers for English, German and Belgian cements, of 4, Fenchurch Avenue, London, E.C., in their annual market report state that trade during 1902 was not, on the whole, prosperous for manufacturers. Consumption in home and Continental markets has been fairly maintained, but in Great Britain the invasion of foreign cements has continued, and the export trade from this country, with the exception of South Africa, East Indies and the United States, has shown no material improvement. The trade generally is still suffering from the effects of over-production, and the absence of united action on the part of many of the leading works.

In London the demand in the earlier part of the year ruled light, but during the summer months and autumn off-take was decidedly brisker, and the general prospects now point to a gradually improving demand during the present year. Stocks are light, and the all-round trade is in better shape than it was twelve months ago. Prices at the mills varied from 24s. 6d. to 25s. per ton. Total production in the United Kingdom they roughly estimate at about 2,100,000 tons, showing a slight falling off as compared with 1901. Prices for export have been lower on the whole, ranging from 5s. 3d. to 5s. 6d., according to quantity and delivery dates.

In Germany, taking the trade all round, there is very little improvement to report. The building trade has been less active, and the tightness of money has told against any large consumption on public and municipal works. In many of the districts cement has been sold at a heavy loss to the mills. The break up of the syndicates has not contributed to confidence, although the wise policy exercised in closing some of the larger works may, in time, bring about some improvement. Immediate prospects do not point to any return of prosperous times such as the trade enjoyed in 1897–1900. For export very low prices have been accepted.

In Belgium mills producing artificial cement have felt the depression, but a reduction in their production is likely to put things on a healthier basis. Low prices have been accepted to keep the mills running, and prospects for the immediate future do not warrant any expectation of a return to better prices. The mills manufacturing natural cement have suffered less severely.

In the United States an active and large trade was done during the past year. Mills, partly owing to the coal strike in the early fall, found it difficult to cope with the big demand, and prices advanced. Most of the mills are well sold ahead for the present year, and rates are firm, but opening of new works may during the present year bring in competition, and help to reduce selling prices.

In conclusion, the general opinion is that the trade has seen its worst, and that although any return to prosperous times is not likely, there is more confidence in a gradual improvement during the present year.

New Companies.

Adams' Patent Sewage Lift Co., Ltd., sanitary engineers and manufacturers, Peaseholm Green, York. Capital: £20,000 in £10 shares (1,000 preference). Directors: M. J. Adams and S. H. Adams.

Adamsez, Ltd., sanitary engineers and manufacturers, of Leeds. Capital: £35,000 in £10 shares (1,750 preference). Directors: M. J. Adams and S. H. Adams.

Artistic Tile Co.. Ltd., tilers, decorators, &c., 3 and 4 Berners Street Mansions, Berners Street, W. Capital: £8,007 in £10 shares.

C. R. Jones & Sons, Ltd., manufacturers of roofing tiles, Ladywood Brick and Tile Works, Jackfield, R.S.O., Salop. Capital: £5,000 in £1 shares.

E. J. Robinson, Ltd., sawyers, timber merchants, &c., Quebec Wharf, Thomas Street, Limehouse. Capital: £12,000 in £1 shares.

George Bray & Co., Ltd., lighting, heating and electrical engineers, Bagley Works, Leeds. Capital: £160,000 in £1 shares (80,000 preference.)

Gypsum Mines, Ltd. Capital: £90,000 in £1 shares.

Ledbetter & Co., Ltd., electricians, &c., of Leicester. Capital: £2,000 in £10 shares.

R. W. Fitzmaurice & Co., Ltd., road paviors, Browning Street, Birmingham. Capital: £10,000 in £1 shares (4,000 preference).

Smith Brothers (Cheltenham), Ltd., timber merchants, brick and tile manufacturers, &c., Albion Street, Cheltenham. Capital £30,000 in £1 shares (10,000 preference).

Swansea Valley Anthracite Collieries Co., Ltd., colliery proprietors, brick manufacturers, &c. Capital: £20,000 in £10 shares.

West-End Estates Co., Ltd., 1A Sloane Court East, S.W. Capital: £45,000 in £1 shares (22,500 preference).

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, Builders' Journal, *9, East Harding Street, E.C.*

Aberavon.—For alterations to Mr. H. J. Stokes' shop, Aberavon. Mr. Frank B. Smith, architect, Port Talbot:—

Morgan Cox	£318	0	0
John Davies	306	10	0
John Nicholas	249	0	0
John Lalle	216	13	5
Anderson & Vaughan*	206	12	0

* Accepted. [All of Port Talbot.]

Bangor (Wales).—For alterations and additions to Glanadda Infants' School, for the Bangor School Board. Mr. Harold Hughes, architect, Bangor.—

H. & J. Williams, Llanrhyddlad, Anglesey	£1,851
H. Edwards, Carnarvon	1,745
Roberts & Owen	1,692
Humphreys & Jones, Llangwyllog	1,621
W. Jones	1,598
R. & J. Williams	1,595

The Board of Trade Journal.

The Official Organ of the Board of Trade. *Published Weekly, ONE PENNY.*

Edited by the Commercial Department of His Majesty's Board of Trade.

Contains each week information on Openings for British Trade, Trade of Great Britain, the Colonies, and Foreign Countries, Tariff Charges throughout the World, &c., &c., and various Trade Notes of importance to all Merchants, Manufacturers, and Shippers.

THE TIMES says:—"Everything, small or great, that concerns trade and traders, comes alike within its scope. There is hardly one of its chapters that might not be expanded into a volume, so compressed, so wide sought, and so miscellaneous is the varied information which it conveys. Its statistical tables and its extracts from consular reports abound in interesting facts. It tells us something of the contents of a dozen recent Blue Books, each of them as bulky as itself. Nothing, indeed, comes amiss to it which by any possibility or stretch of language can be included under its comprehensive title."

THE MORNING POST says:—"It is, as its many readers are aware, a record of the recent movements and present position of British and Foreign Trade, compiled from reliable sources, and is a very valuable, if not indispensable, publication to Merchants and others engaged in Commerce."

All Applications for the Insertion of Advertisements in this Journal must be addressed—

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

Feb. 25, 1903. Vol. 17, No. 420. 9, East Harding Street, E.C.

Empty Niches. WE take a pleasant pride in the fact that sculpture is a revived art among us, full of life and suggestiveness. Possibly there is a greater era before us, when the decoration of public buildings with fine statues will be universal. If so, architects are far-seeing men, for our buildings have no lack of niches in them for the statues of to-morrow! Tradition in some things may be dead, but surely the inheritance of this niche-providing faculty is patent to everyone, as true of this generation as of the last, like a silent power which directs men's minds towards futurity. These empty niches look down on us from all sides. What a surprising number there are on St. Mary's Church in the Strand, on the heavy rusticated walls of Somerset House, at the corners of the Law Courts, and on our churches, free libraries, and other public buildings —those empty niches among a world of honoured men! The new Gaiety Theatre has some, we notice. Architects might, perhaps, take the hint. Certain lights of the "Art Nouveau" school have the ingenious argument that though we of to day may not like their work it will be held in admiration by our children's children, whose perceptions are to be trained by its glorious colours and its flowing lines. Presumably the niche-building architect has similar gleams of the future. Meanwhile there is a lack of statues. Would it not be far better to curtail this zeal for niches, and provide a few quiet places where a medallion might be put in honour of a worthy man?

Balzac the Client. AT Ville d'Avray a house was built for M. Honoré de Balzac, the well-known novelist: the house in which, many years later, Gambetta died. Like numerous other clients, M. Balzac had very definite ideas of what a house should be. One of his ideas was that rooms should be large and airy—how indeed should the poet's soul be compassed by the small measure of a common villa? He ordered the size of the rooms to be increased. This pleased him, and then—contentment not being of this world—had them made still larger, until at last they filled the whole house. Clients of this kind should be their own architects in fact as well as in assumption. M. Balzac's architect had suggested that, though large rooms were very desirable, one had to think of the staircase. Perhaps it was not true that the building was finished before the novelist realized he could only reach the upper storeys by a step-ladder, but the staircase had to be built outside!

The Right and the Wrong. QUESTIONS arise in every art when it is difficult to decide which method is the right one: and in many such cases the choice is very much a matter of personal opinion or taste. The purist louldly declaims for absolute integrity of treatment, while, on the other hand, the free worker is just as zealous in his contentions for licence. Perhaps the mean between the two is the best method, after all. For instance, last week Mr. F. Hamilton Jackson lectured before the Society of Designers on intarsia and marquetry, and the point arose as to whether it was legitimate to engrave the work—intarsia is a kind of inlay, while marquetry is a mosaic of veneer. Mr. Aumonier took up the purist's standpoint and considered that Mr. Stephen Webb's designs were spoilt by this engraving, which was quite foreign to the work, and that every desirable amount of detail could be given with saw cuts: while, on the other hand, it was held that shading the wood with hot sand, staining it, or engraving it with fine lines which could not be got by any other method, were perfectly legitimate. That is the point. It is one applicable to many other arts. For ourselves we think that primarily the limitations of every material should be strictly respected, and that it is foolish to try to copy degrees of fineness which could not be obtained in a direct manner: but there must be some latitude in these things. It is contended that in leaded glass the lead itself should form all the outlines. That is a good and approved principle—yet by painting lines of the figure, for instance, on the glass an effect is secured which would not otherwise be possible. Both are lines against light—one in lead, the other in glass—and it is impossible to say that either is absolutely right or wrong. Yet there are unwritten canons which the works of past ages have established, even though egotism affects to disregard them, being engrossed with its own self-styled genius. These canons demand recognition.

The Exeter Cathedral Glass. As already announced in our columns, it is proposed to remove the glass in the west window of Exeter Cathedral and replace it with other as a memorial to the late Archbishop Temple. Nowadays there is an outcry about everything, and this proposal has found a fervid antagonist in Mr. Stuart A. Moore, F.S.A. There is no need, however, for any outcry about the removal of this glass. William Peckitt did it in the eighteenth century, and consequently it is very poor work. It appears that the idea was to have a border around the seven figures consisting of the coats-of-arms of subscribers, the border running up into the great wheel, where on a foundation of ducal and baronial shields the less impressive coats of baronets should float in the "diluted rays" of the setting sun. The Chancellor of the Cathedral observes that the then Dean and Chapter were good financiers. "They made a profit on the Archbishops' arms of two guineas, a guinea each on the arms of each peer, and on the arms of eight of the baronets and the four members of Parliament of a guinea and a half each. But the business side of Mr. Peckitt's head was better than the artistic side. He brought in a bill for extras which more than swallowed up the savings." It is opportune to refer to Mr. Drake's lecture on the glass in Exeter Cathedral. Speaking of the great east window and its attempted restoration by Peckitt in 1761, when heads of the true Georgian type were put on the figures and the canopies much tampered with, he says: "Mention of these figures reminds me of a curious freak of Peckitt of west window renown. In the light next the centre on the south side is a bishop; his head is covered, not with a mitre, but with a piece of a broken canopy from another window which to Peckitt seemed liked a mitre." This is the glass which occupies Grandisson's fine window. True, there is an historical interest in it, but the window is worthy of a better filling. Peckitt's glass is, we understand, intended to be put in the chapter-house. That is fitting enough. What an inestimable benefit it would be if we had some miles of sheds where this dull but historical work could be housed, provided no evil-minded purists were allowed to turn incendiaries.

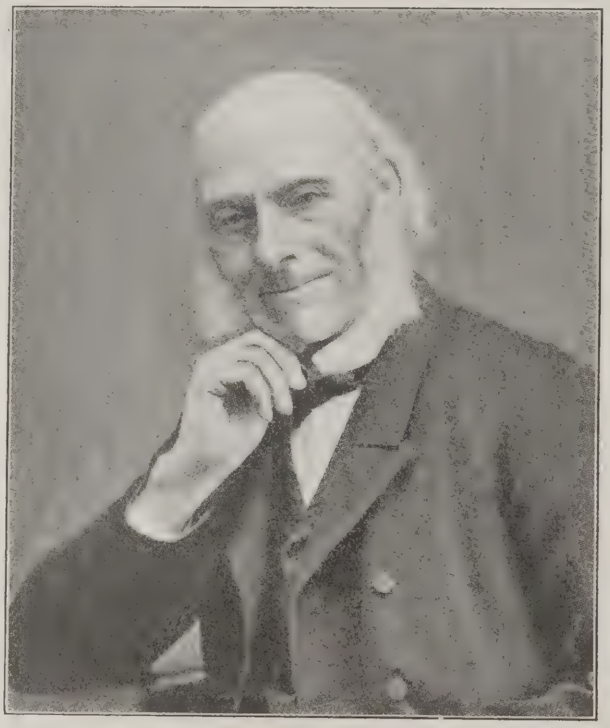
THE LATE MR. F. C. PENROSE.

AN APPRECIATION BY PROF. R. ELSEY SMITH.

IN Francis Cranmer Penrose the architectural profession has lost a member occupying an almost unique position and one whom it could ill spare. It is not so much that he was known as certainly the most accomplished student of Greek architecture of our nationality, and one of the greatest authorities on this profoundly interesting subject, as that he was and remained till the very end of his life an earnest, painstaking and diligent student. He belonged indeed to a period essentially remote from the feverish rush of modern life, when many a student feels that a period of three or four years after the ordinary school career is a somewhat long period to devote to the special study necessary to equip him for the practice of an arduous and complex profession. His training was received and much of the work with which his name is imperishably associated was carried out in the first half of the last century, when affairs were conducted with more deliberation, and before the facilities due to the steamer and the express had brought all parts of Europe at least within such easy reach as to render flying visits to this country and that a substitute for the now old-fashioned grand tour and protracted study on the Continent.

Students with the natural gifts, the wide cultivation and the disposition to enter upon such serious investigations as were undertaken by Mr. Penrose must always be rare, but there is, perhaps, with the stress of modern professional life less likelihood of their appearing in the future.

It is scarcely necessary to refer in any detailed way to the work Mr. Penrose accomplished in connection with the investigations into the principles of Athenian architecture, but it is perhaps hardly realized to what an extent, as circumstances permitted, he seized opportunities of resuming and extending studies which commenced with an examination extending over many months of the buildings that lay scattered in the Acropolis at Athens and in particular of the Parthenon.



THE LATE F. C. PENROSE, M.A., F.R.S., LITT.D., D.C.L., F.S.A., F.R.I.B.A.,
Knight of the Order of the Saviour in Greece, Antiquary to the Royal Academy, P.R.I.B.A. 1894–1896, Royal Gold Medallist, 1883.

At the time when I was first privileged to have any intimate acquaintance with Mr. Penrose he was residing in Athens as the first director of the newly-established British Archæological School; and though even at that time he had nearly reached the span of three score years and ten he was engaged with all the enthusiasm and energy of a man of half his age, and with a painstaking care all his own in a further series of investigations with a view to the preparation of a second edition of his monumental work which shortly afterwards appeared.

Anyone who has studied this work in either edition must have been impressed with the infinite pains taken to ensure accuracy; and after seeing Mr. Penrose at work on the buildings one could not but be struck with the extraordinarily intimate and accurate knowledge he displayed of the details of a great variety of buildings and the trouble that was taken where necessary to verify any doubtful fact or dimension.

This was by no means his last visit to Athens, and but a few years ago he journeyed thither to attend the investigations of the international commission upon the present condition of the Parthenon.

That he remained a student to the very end is evidenced by a paper read within the last few months before the R.I.B.A.; and it is to be hoped that during the last few years, during which he had retired from active practice, and had in particular ceased to be responsible for the care of Wren's great fabric, he may have been able to complete, or at least carry forward, other investigations into certain of the Greek curves for which he had prepared a mass of data.

But architecture was by no means his only study, and as an astronomer he spent many hours and many whole nights in a series of observations made in his observatory erected in the garden of the charming house he had built for himself in the high ground south of the Ridgway, at Wimbledon; he was in particular interested in the problems in which the science of astronomy and the art or architecture are intimately related, and in connection with which at least one special visit was made to Greece. And it was in recognition of his investigations into the orientation of temples that he was elected a Fellow of the Royal Society, a distinction attained very rarely by members of our profession.

If the profession has lost an ornament in one who had fittingly received the highest distinctions that could be bestowed by the hands of his brother architects, and in recognition of his distinguished services had been decorated by the King of Greece, many of its individual members—and a far wider circle, indeed—are mourning the loss of a valued friend.

Mr. Penrose's disposition was a retiring one, but he was ever ready to lend his counsel and advice to any brother architect or student who came to him for it, and he devoted the same unstinted trouble to clearing up any difficulties in such a case as was usual with him in more important matters.

During my visit to Greece about sixteen years ago a short tour was arranged with Mr. Penrose and other members of his family, and it is impossible for me to forget the interest which his presence and companionship gave to this trip. The ground covered was not new to him; indeed, one was struck by the intimate knowledge not only of the buildings but of the topography and the natural features of the country through which we journeyed. Of this intimate knowledge we had constant evidence, as well as of the cheery good humour with which the various *contretemps* almost inevitable in such an expedition through the less known parts of Greece were met. Not, perhaps, less surprising was the wonderful energy which sustained him through long days of travel, and found him ever eager at each halting place to visit any point of interest, or to start at once upon some drawing, most often in water colour, of which he was extremely fond. Numerous and most interesting are the records made by his pencil and brush on his various visits; and though some were but slight they include many beautiful and carefully finished drawings of the buildings and scenery he loved so well, not only in Greece and Italy, but in our own country too, of whose architecture also he was a diligent and constant student.

Of his intimate family life it is not fitting that I should speak; but to his many friends, while sympathising with the double affliction to those who are bereaved, it cannot but seem that there is something appropriate and consoling in the fact that Mr. Penrose and she who for so many years was his constant companion should have passed almost side by side into the great hereafter.

Lord Dillon says: "It may interest some of those who were brought up on Mrs. Markham's 'England' to know that the late Mr. Penrose was the original of the intelligent 'George' who so often asks for more information on various points of history. The late Sir George Scharf, K.C.B., to whom the 'History' was indebted for its exquisite illustrations, is my authority for this identification." But the Rev. G. Biscoe Oldfield corrects this. He says: "The late Sir George Scharf was mistaken in identifying Mr. Penrose with 'George,' for Mr. Penrose himself told me that he was the original of 'Little Mary'."

About twenty-five years ago, when Mr. Penrose was architect to St. Paul's, a party of members of the Institute paid a visit to the cathedral in connection with one of their conferences. Particular care had been taken to prevent any outsiders joining in the round of inspection: but, somehow or other, two uninvited persons managed to pass unnoticed among the party. They took the greatest interest in everything: so much so that they were the last to leave the chapter-house. Mr. Penrose waited to close the door, and as one of the unbidden guests passed out he expressed his thanks for the privilege of looking over the cathedral; he also attempted to put a coin into Mr. Penrose's hand (thinking he was the guardian): but the architect discreetly managed to cough and put his hand to his mouth. The visitor then understood, and probably felt uncomfortable.

The remains of Mr. Penrose were interred on Thursday last at Christ Church Cemetery, Copse Hill, Wimbledon. Mr. Aston Webb was among those present

LONDON BUILDING ACTS (AMENDMENT) BILL, 1903.

By **EDWIN B. B. NEWTON, A.M.I.C.E., F.S.I.**

THIS Bill consists of four parts, twenty-eight sections and two schedules, and is proposed in amendment, as regards "the provision and maintenance of proper means of escape in case of fire from buildings in London, and the reduction of the risk of fire in the case of such buildings," of the London Building Act, 1894.

Its appearance at the present juncture is probably due to the recent serious fire in Queen Victoria Street, but some such provisions as those in the Bill have been contemplated for a considerable time.

Definitions.

Part 1 deals with preliminary matters, including the interpretation of various words in the Bill.

"Owner" is so defined as to include an agent or a trustee, except as regards the payment of fees to the district surveyor under section 24, where the word is to have the meaning assigned to it by section 5 of the Act of 1894.

A "high building" is to be one with the floor of a storey at more than 50ft. above the footway or ground.

A "new high building" is to be one which shall not have been "*bona-fide* and substantially commenced at the date of the passing of this Act," and any existing building altered, &c., into a "high building."

An "existing high building" is to be any high building which is not a "new high building."

An "upper storey" is to be a storey whose floor is more than 50ft. above the footway or ground, &c.

A "new building" is to be (*a*) "any building erected," (*b*) "any building one-half of which has been taken down and re-erected," and (*c*) "any space between walls and buildings which is roofed or commenced to be roofed"—"after the passing of this Act."

This definition is the same as that in the Act of 1894, except that one refers to 1894 and the other to whatever date (if any) on which the new Bill may become law.

There is in the Act of 1894 no definition of the word "building," and the same remark applies to the new Bill. It will be remembered that in the Bill of 1894 the following definition of the word "building" was proposed: "An erection comprising a cubical space defined by walls posts piers columns or other supports or enclosures and a roof whether the erection is wholly enclosed or not and whether it is fixed on permanent foundations or not and of whatever material the supports enclosures or roof may be composed."

This definition was not incorporated in the Act of 1894, and there have been what to some may appear conflicting decisions as to the meaning of the word in certain cases.

Part 2 deals with "means of escape in case of fire."

New High Buildings.

Section 63 of the London Building Act, 1894, enacts that "every new building exceeding 60ft. in height shall be provided on the storeys, the upper surface of the floor whereof is above 60ft. from the street level, with such means of escape in the case of fire, for the persons dwelling or employed therein as can be reasonably required under the circumstances of the case, and no such storeys of such building shall be occupied until the Council* shall have issued a certificate that the provisions of this section have been complied with in relation thereto."

The terms of sections 6, 7 and 8 of the new Bill of 1903 ensure the provision and maintenance of means of escape in case of fire from all new high buildings, the non-occupation of upper storeys of such buildings until certified by the Council to have such a provision, and the revocation of any certificate in case of any alteration in the conditions under which it may have been granted.

Sections 6 and 7 are much the same in effect as section 63 of the Act of 1894, but include of course (by reason of the definition in the new Bill of "high building") buildings 10ft. less in height. Excellent as the sections are in their intentions, they are of a very arbitrary character. The means of escape are to be "to the satisfaction" of the Council and such "as shall be reasonably practicable"; there is no indication as to what is here meant, and requirements so loosely described as these may mean anything from a bare iron ladder to a first-rate and expensive staircase or other means of descent in a specially constructed annexe to a main building, everything being of a fire-resisting character.

There is no provision for any appeal from the requirements of the Council under sections 6, 7, 8, and 9 (*post*), so that an owner of a new high building may be continually subject to requirements of the Council, which may be such as they entirely in their own discretion may enforce, and as they may apparently from time to time alter, vary and make more stringent, at their own will.

In section 7 the word "dwelling" is used, but there is no definition of it in the Bill. Section 5 (25) of the Act of 1894 contains a definition of "dwelling-house," but there is a slight difference in the meaning of the terms.

A perusal of section 8 gives rise to an impression that there may be a lack of finality in the requirements of the Council which may prove unduly vexatious and harassing. It provides that in case of a change in the condition of a high building or a part of it, the Council may revoke its certificate. Wherever possible a requirement should be one of a definite and conclusive nature.

The duty of seeing that all escapes are kept in good order and condition would appear to fall on the district surveyor, as section 15 states that it shall be his duty to ascertain and notify to the Council every building within his district to which Part 2 applies. Section 23 gives to him and "any officer of the Council duly authorised by the Council in writing" the right to "enter, inspect, and examine at all reasonable times any building," and section 24 enacts that the district surveyor shall be paid the fees detailed in the second schedule.

It is somewhat peculiar to require that the works shall all be executed "to the satisfaction of the Council." It would seem much better in the case of matters like these arising out of the Act, and purely of a technical character, that they should be carried out to the satisfaction of some permanent expert official of the Council, or be regulated by by-laws which might be administered by the district or the borough surveyor when there would be a greater security against variation in requirements arising out of changes in the composition of an elective body.

Those who have had occasion to make application to the Council in respect of some matters as to which the Council possess a jurisdiction under the Acts of 1894 and 1878 know what delay, inconvenience and dissatisfaction arise, through no fault of the Council or their officials, by reason of there being no official whom an architect making a proposal can consult, and from whom the architect can obtain at a single interview an exact, a definite and a final specification of the requirements which will be necessary to be carried out, and the condition which must be observed before any proposals can be regarded as satisfactory and approved.

The provision of an appeal to a tribunal from the decision of such a single official of the Council as suggested above, would amply safeguard the interests of the public and ensure that the power vested in the official should not be exercised unreasonably or arbitrarily.

Section 9 requires internal staircases designed for providing means of escape from a new high building to be constructed, together with their walls, partitions, doorways and frames, of fire-resisting material.

This seems entirely satisfactory.

Existing High Buildings.

Section 10 requires the owner of every existing high building other than a dwelling-house, occupied as such by not more than one family, to submit on or before January 1st, 1905, particulars of the means of escape then existing and those, if any, proposed.

The Council may then approve or disapprove these means of escape and, in the latter event, require others.

The owner is permitted within two months to dissent from any condition or requirement of the Council, and either party may within fourteen days appeal to arbitration under the Act. If the owner fail to dissent within such two months he is deemed to assent.

The Arbitration Clasues

are contained in schedule 1. Each party is to appoint within twenty-eight days an arbitrator, and the two arbitrators must before entering on the reference appoint an umpire.

This procedure, though likely to be fair, will with equal probability be prolonged and tedious, and will not ensure uniformity in regulations. A tribunal of appeal such as, or constituted similarly to, the one under the Act of 1894 would appear efficient, quicker in its action, and without doubt more uniform in its views than a series of changing bodies.

It may be fairly stated to be a generally accepted opinion that the tribunal of appeal appointed in accordance with the Act of 1894 has worked satisfactorily, and that it possesses the confidence of professional men.

The owner may, up to six months after providing means of escape under this section, apply to the county court, who may apportion the expense or a part of it upon the occupier.

Section 11 requires that on and after January 1st, 1908, the provisions of the foregoing sections 6, 7, 8 and 9 shall apply to all existing high buildings, provided that—

(*a*) Where section 8, touching "means of escape to be provided from new high buildings," is to be applied to the purposes of section 11, it shall be subject to the provisions of section 10 (*ante*).

(*b*) The "means of escape" shall, on a difference, be those determined by such arbitration under section 10; and

(*c*) The Council's certificate under section 7 shall be one that the means of escape determined by the award have been provided.

The probable severity of sections 10 and 11 is manifest, and in some cases, unless the Council are content to reduce their requirements to mere matters of form, which is hardly likely to be the case, compliance with the sections will be impossible, and necessitate the closing for certain purposes of the upper storeys of such high buildings under section 13.

In spite of the high value which must be set upon human life, and the corresponding necessity for very great care and precaution being exercised towards its preservation, there is nevertheless a limit to even this value, and it is very questionable whether the increased security which would be gained would be at all commensurate with the expense, loss and difficulties which the enforcement of sections so arbitrary and comprehensive as these would involve.

---

* London County Council throughout this article unless otherwise distinctly stated.

Assuming the Bill to become law in 1903, within a period of between four and five years all existing high buildings would have to be brought into conformity with the requirements of the County Council. Were it definitely known that these requirements were to be comparatively easy of execution, four years would be short time for owners to arrange to do the necessary work; and as, instead, the requirements may be most difficult to comply with and involve almost re-building some premises, fifteen years or even twenty years would not be too long a time to allow.

New Buildings.

Section 12 requires that every new building (not being a dwelling-house occupied as such by not more than one family) in which sleeping accommodation is provided for more than thirty persons, or in which more than thirty persons are employed, shall be provided with such means of escape in case of fire "as shall be reasonably practicable," which means of escape shall be maintained in good order. Such new buildings must be certified by the Council to have such means of escape, &c., and in case of any alteration in the conditions under which the certificate may have been granted it is to be subject to revocation under section 8 applying to new high buildings.

Here again the requirements of the Council may be anything whatsoever. Some indication of the necessary means of escape should either be given in the Act or provision made in this for the subsequent drafting of by-laws describing a regular code of such requirements. A building owner ought in every case to know beforehand, at any rate to some extent, on what lines he will have to arrange his structure, and to what purposes it may be applied, without the fear of erecting a building for a definite purpose one year, only to have it condemned the next on account of a change in the opinion (possibly arising out of a change in the composition) of a governing body.*

The draft clause for this section originally proposed used the words "forty persons" in lieu of "thirty persons," but the latter words were substituted at the meeting of the Council approving the submission of the Bill to Parliament.

Section 9 (*ante*) is to govern the construction of the internal staircases in such "new buildings," and sections 10 and 11 (*ante*) are to apply to every existing building of the same character as the "new" building referred to in section 12.

My remarks on those sections apply similarly here.

Closing of Unsuitable Buildings.

Section 13 provides that when adequate means of escape cannot be provided from existing high building or existing buildings such as are described in the last paragraph but one of this article, a petty sessional court may by order prohibit the use in contravention of this Act—

(1) Of an upper storey of an existing high building or any room therein as a dwelling, for employment, or for resort, &c., for any persons.

(2) Of the whole or part of an existing building (not being a dwelling-house occupied as such by not more than one family and not being a new building) for more than thirty persons to sleep therein or for the employment therein of more than thirty persons.

Section 14 requires a register of orders made under the last section to be kept.

District Surveyor.

Section 15 has been referred to in the middle column of the preceding page.

Factories and Workshops and Common Lodging-Houses.

Section 16 exempts any building the whole of which is a factory or workshop within section 14 of the Factory and Workshops Act, 1901, or within any by-laws under that Act, and also any common lodging-house within any statute relating to such houses in London from Part 2 of this Act.

There are published certain statements as to the general requirements of the Council under the Factory and Workshops Act, 1901 (originally made under the Acts of 1891 and 1895) as to means of escape from fire, and a perusal of these is interesting. Little amendment could fairly be asked for where the provisions of these statements are complied with.

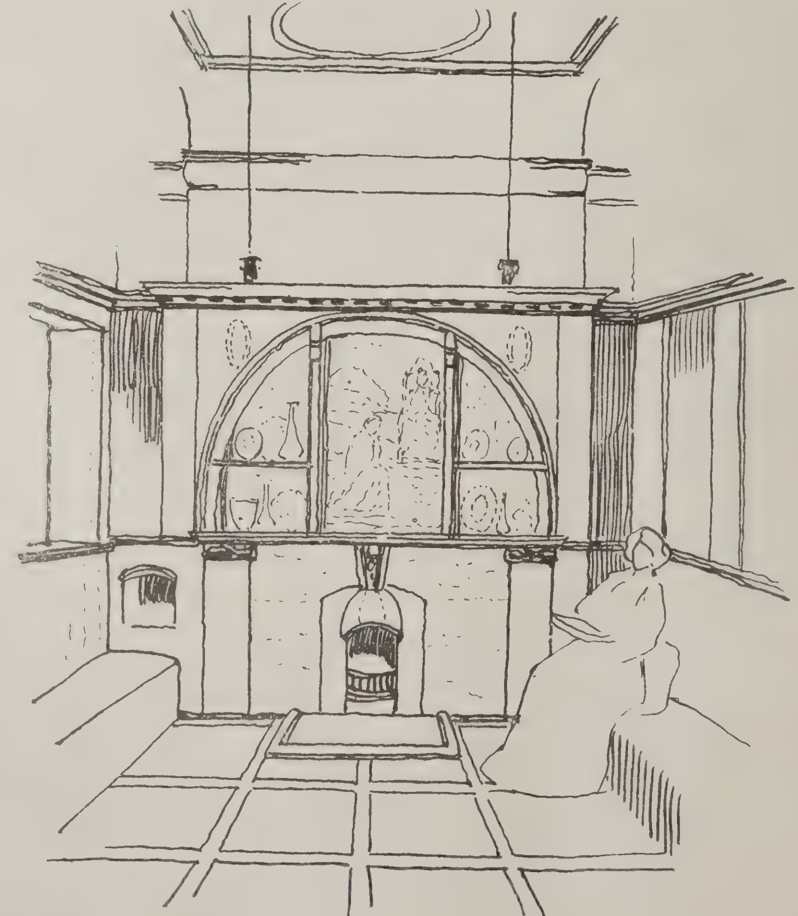
(To be concluded.)

An important resolution was adopted on Tuesday last week by the members of the Streets Committee of the City Corporation with reference to the unanimous demonstrations of opposition which have been manifested throughout the City with respect to the London Building Acts (Amendment) Bill. The resolution was: "That, having regard to the general opposition throughout London to the London Building Acts (Amendment) Bill, a representation be made to the London County Council asking that body to withdraw the measure and to arrange a conference with the Corporation and the metropolitan borough councils to consider the whole subject, with a view, if possible, to a Bill being framed that will effect the object without needlessly oppressing property owners." The City Corporation will be asked to approve this proposition.

On February 17th a special committee presented to the Paddington Borough Council an elaborate report on the Bill. The vital question, in the opinion of the committee, is the appointment of the district surveyors, whose duties the Bill promoted by the County Council seeks to enlarge. The committee submit that the metropolitan, City and borough councils should appoint the district surveyors, and that as those councils are responsible for the sanitary supervision of every house in their respective districts, they should specially have the control over construction as well. The committee maintain that a system under which one authority approves the drains and another the bricks and timbers is "a bad one in principle, and not conducive to economy, public policy or convenience." Further, it is pointed out (1) that there is no reason why the metropolitan borough councils should be denied functions possessed by provincial municipalities; (2) that the London County Council, with whom the appointment and limited control of district surveyors now rests, might still frame rules for the general guidance of those officials and continue in touch with them by—as in the case of local medical officers of health and sanitary inspectors—paying half their salaries.

The town clerk of Paddington (Mr. A. W. J. Russell) was instructed by his council to write to the other metropolitan councils asking if they were agreeable to appoint delegates to attend a conference to consider the subject of the proposed transfer of powers under the London Building Act as indicated. If a majority prove favourable a conference will be held at the Paddington Town Hall.

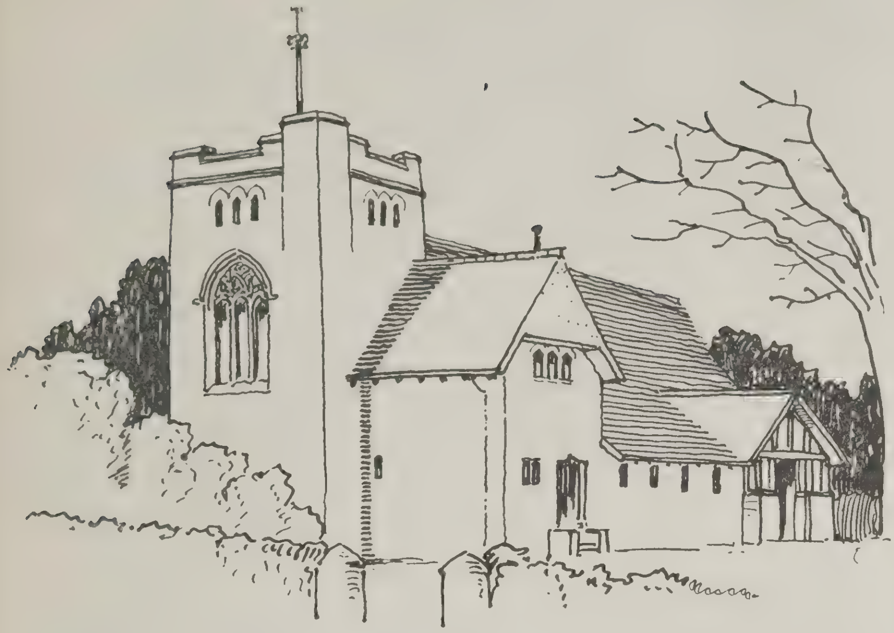
The Lord Mayor, in response to numerous requisitions and resolutions of ward meetings, has given directions for convening a public meeting of the citizens at Guildhall on Thursday, March 5th, at noon, to protest against the provisions of the Bill.



BILLIARD-ROOM FIREPLACE, PARK CIRCUS, GLASGOW.
J. SALMON AND SON, ARCHITECTS.

---

* See the remarks on preceding page.



ST. MICHAEL'S CHURCH, CARNTYNE, GLASGOW. H. E. CLIFFORD ARCHITECT.

GLASGOW FINE ART INSTITUTE.

THE ARCHITECTURAL EXHIBITS.

THE exhibition of works of art at the Institute this year is a very fine one. A large number of excellent loan pictures, besides new works, are hung. The sculpture exhibits are very good, and are well shown; but the architectural works this year are fewer, numbering only thirty-four: the general excellence, however, is superior to that of former years, and there are only one or two that might be termed commonplace. Messrs. Salmon & Son show a series of photographs of business premises, No. 144, St. Vincent Street, Glasgow, a drawing of which appeared in this journal for December 31st last. The photographs give a very good idea of the building, which differs somewhat from the perspective drawing in its detail. The design, however, in spite of some very original bits of detail, is not altogether a success. It is a steel-framed structure with a stone front, and the stone looks just a little wiry. The same firm also show a dainty pen-and-ink drawing of a billiard-room fireplace for a house in Park Circus, Glasgow, the treatment of which is novel and effective.

Mr. P. Macgregor Chalmers is represented by a perspective of Saint Columba Church, Blackhall, Edinburgh (see THE BUILDERS' JOURNAL for November 26 last). The grouping is very effective and the style, which is Norman, lends itself to a broad and simple treatment. The design of the tower is specially good. The same architect also exhibits a brown-ink drawing of a house at Skelmorlie. The half-timber and the crow-stepped gables and general Scottish feeling in the detail combine to make a very interesting group. A perspective view of St. Michael's Church, Carntyne, by Mr. H. E. Clifford, is a good example of the village church. We do not care so much, however, for his house at Troon (No. 552), although it is shown by a better drawing.

Photographs of Tea Rooms, 137, West Campbell Street, are shown by Mr. W. G. Rowan. The treatment is new, and free in style.

Mr. Alexander Cullen, F.R.I.B.A., shows two perspectives of the Middle Ward Offices, Hamilton—one of the main staircase, the other of the central hall. These works are massive in their style, but there is a lack of individuality and freshness about them.

Mr. John A. Campbell is represented by a perspective of a large new building which is at present being erected at the corner of West George and Hope Streets, Glasgow. The mass and general effect are very good, and the detail so far as the building has been erected is quite equal to the former work of this architect. The general simplicity of this building contrasts well with some of the fussy work, overloaded with thoughtless detail, that has been erected of late years in Glasgow and its neighbourhood. No. 548, photographs of country work, by the same architect, show pleasing details of stabling of a house at Baillieston.

The work of Mr. R. S. Lorimer is always refreshing in its quaintness and originality. His exhibit (No. 564) of photographs of interiors, Great Western Terrace, Glasgow, is quite equal to what one would expect from him. The treatment is Scottish, the detail very thoughtfully considered.

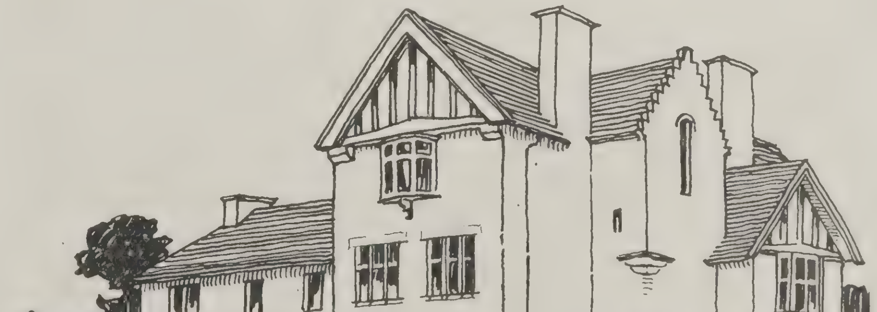
No. 550, a hall interior by Mr. John Ednie, is good of its kind, but its kind is *l'art nouveau.* Messrs. Walker & Ramsay, the two young Glasgow architects who were responsible for the Wolverhampton Exhibition last year, show photographs of this work. It can only be considered as partially successful.

Three interior photographic views (No. 547) are shown by Mr. Alexander N. Paterson, M.A. The rooms shown have coved or barrel-vaulted ceilings, and while these are very successful in one view they are far from it in the view with the oriel, where the cove in its efforts to run round that feature looks ill-considered. Mr. D. Andrew, Junr., is responsible for a good design for a school at Kilbowie; while Mr. Fred Rowantree is represented by two very fine drawings of two York residences, both of which are pleasing in design. Messrs. Niven & Wigglesworth show a fine drawing of the annexe to the Scandinavian Sailors' Home, London, and two photographs of a house at Wimbledon, Surrey, reproductions of which were published on p. 335 of THE BUILDERS' JOURNAL for December 31st last.

A very powerful water-colour of a doorway is shown by Mr. D. Whittet. It is a very successful piece of work, individual and original on the right lines. We do not care so much, however, for his proposed treatment for Hall, No. 566. Mr. James A. Morris, of Ayr, is represented by two frames of photographs of Hinton House, Northamptonshire, both of which are very delightful.

Messrs. Watson & Salmon show two perspectives—one of a Wesleyan Methodist church at Girvan, on somewhat familiar lines, and a design for a district free library, which is good but somewhat heavy in its proportions.

These works are shown on the walls of the grand staircase: surely not the most suitable place for exhibiting the works of the mother of the arts. Of course, the Institute must pay, and in order to do so must have sales. Now, very few of the architectural works—only two in the present show—are for sale. The architectural section, therefore, brings practically no commercial return to the Institute; but, still, as the patron of the arts, this society should surely offer every encouragement to the art from which every other art springs and on which all depend.



ADDITIONS TO HOUSE AT SKELMORLIE. P. MACGREGOR CHALMERS, I.A., ARCHITECT

B

THE ARCHITECTURAL ASSOCIATION.

THE STAINED GLASS OF THE FUTURE.

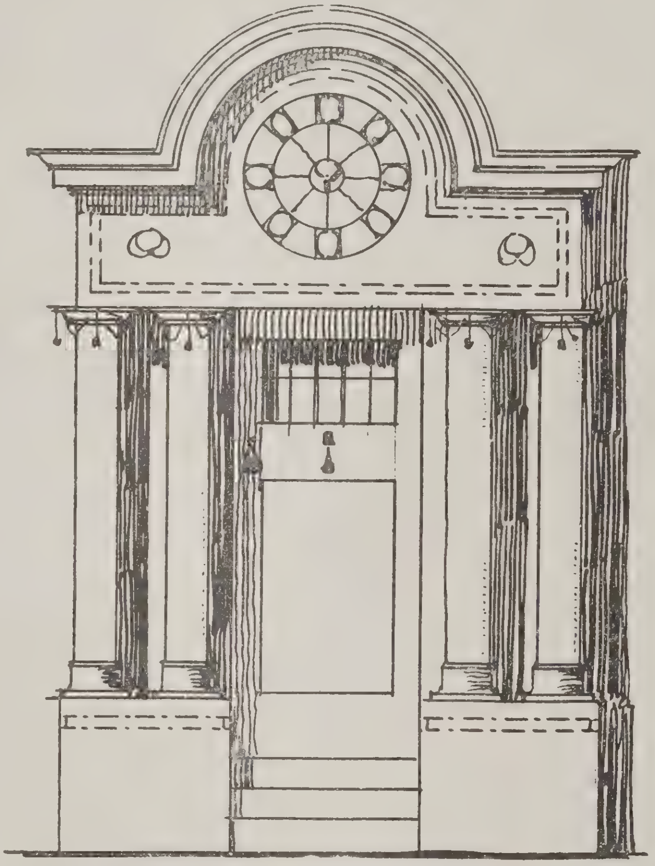
By **SILVESTER SPARROW.**

A MEETING of the Architectural Association was held at 9, Conduit Street, W., on Friday evening last, the chair being occupied by Mr. Henry T. Hare. The following members were elected:—W. Hart Gregson, G. P. Bankart, C. L. Wright and C. F. Cargill. The following additional donations to the New Premises Fund were announced:—Mr. Andrew Oliver, £2 2s. 6d., and Mr. R. H. Weymouth (second donation), £2 2s. A vote of condolence with the family and relatives of the late Mr. Penrose was passed.

Mr. Silvester Sparrow then read his paper on "The Stained Glass of the Future," of which the following is a summary:—

This title has been adopted in imitation of Richard Wagner's "Art-work of the Future." That which was scoffed at as an idle dream and parodied as "The Music of the Future" has become a present actuality. May the omen be propitious!

There is scarcely any subject about which more ignorance prevails than in stained glass. The very title of this address would seem to disclose a certain dissatisfaction with stained glass as it is. It will, therefore, be our first task to find the cause of our dissatisfaction—to diagnose the disease, in fact, before we talk of remedies. Imitation is the disease! And why is imitation the disease? Because it has been said, and repeated on all sides, "There is no glass like the old glass, and there will never be any windows like the old windows." Both these assertions I deny, since they are based on ignorance of the best material procurable to-day, and of the use that might be made of it. The essential qualities of a stained-glass window are that it must look like glass and give tone. I must protest against glass being used as a material for excessive painting. A plea that will doubtless be put forward by the imitators is that if you have to put windows in a thirteenth- or fifteenth-century church you must imitate the glass of those periods. But the very existence of different styles, almost coincident with the centuries, so that we speak of a thirteenth, a fourteenth, or a fifteenth-century style, proves that the old men did not imitate their predecessors. There is another theory, that the old men adapted their glass to the varying styles of architecture. It may be that architects of the fifteenth and sixteenth centuries called for a lighter glass which would show up the more elaborate carvings they indulged in. Those who hold this theory may say that the glass stainer of to-day should adapt his glass to the architectural style of the nineteenth century. But is there a nineteenth century style? Let us leave the question of why the early glass-stainers did this or that, and assume that if they were alive to-day they would have sufficient honesty to use the best material, and sufficient talent to make the best use of it. What, then, is to be our own course with regard to this crucial point? This is the fundamental and unalterable guide for our conduct: One has no right to put bad glass into a window under any pretext whatever. To imitate, one would have to ignore the best glass. The highest qualities of a stained-glass window are Mystery and rich and appropriate colour in harmony with the subject. Do not tell me, therefore, that an imitation fifteenth-century window is appropriate when it lacks mystery and richness of colour. If a window is full of mystery and devotional feeling, a living symbolism, rich and harmonious colour, a simple and dignified design, strengthened by a bold use of the lead, and an expressive tracing and painting, it is worthy to be placed in any church that was ever built. The best material is undoubtedly Prior's Early English glass and Powell's Antique. Early English is a comparatively recent invention, having been in existence only some few years. One would gather from its name that it is an attempt to restore the old English glass; but in my opinion, in the quality of brilliance, in its variety and richness of colour, this far surpasses its original, and I have no hesitation in saying that this is the finest glass that has ever been made for our purpose. There are three sorts of coloured glass used in the stained-glass window—tints, which go under the generic term of "whites"; pot-metals, in which the colour goes right through the sheet; and the flashed glasses—that is, the rubies, some blue, and other varieties. The method of manufacture is somewhat like this. A piece of metal, as the molten glass is called, is taken on the end of a blowpipe, and blown into a square-bottle shape. This contact with the mould gives the glass a certain roughness and inequality, while the inside of the bottle retains a very smooth blown surface. It is this combination which is the characteristic of this kind of glass—brilliance united with body, a faculty of holding the light—while "antique" is more or less transparent. It also varies considerably in thickness, some pieces being quite half an inch thick or more. All this helps its rich and jewel-like quality. The bottles are then cut at the edges of the sides and bottom; which gives us four sides or slabs 6in. by 4in. and one bottom 4in. by 4in. This is the most general size. Other sizes are 7in. by 5in. and 8in. by 6in., the largest. It has been found that this size cannot be exceeded without losing the jewel-like quality of the glass. In flukes or accidents, which are the best things in the manufacture of material for stained-glass, it is particularly rich. When the heavier chemicals sink to the bottom of the pot, the last few bottles that are made from it are streaked and varied in colour in a most wonderful and beautiful way. The colour of these bottles may be quite different from those made from the top of the pot. This quality of unexpectedness is most valuable, and a window largely carried out in this material is unique, absolutely inimitable. It must be said, however, that the scale of colour is not exhaustive, and that some of the colours are very crude (although these have their uses occasionally), so that one has to fall back on Powell's "Antique," by far the best of the so-called "antique" glass. Although Powell's "Antique" is not so fine as "Early English," it has qualities of its own to which, in the present state of the manufacture of "Early English," it may be regarded as complementary: thus I include it in the term "best material." Although it has not the brilliance and body of "Early English" it has those qualities in a much higher degree than other makes of "Antique," which I need not specify. I should mention that there is an imitation of "Early English" called "Norman," which bears a relation to its original similar to that which the common "Antiques" bear to Powell's, and is cheaper. Let me therefore warn you, when you specify Prior's "Early English," to see that "Norman" is not substituted. When I mention that you can get "Norman" for 3½d. per slab, and the lowest price of "Early English" is 6d. per slab, the reason for the substitution is obvious. Broadly speaking, "Early English" has more light, Powell's "Antique" more tone; so that one would use "Early English" for effects of light and brilliant objects and Powell's "Antique" for the parts requiring tone. It is also good to plate a crude piece of "Early English" with, to gain variety of colour and tone. The process of manufacture in Powell's Antique is quite different from the other. It is made in what is called a "muff"—that is, the metal is blown into a cylindrical form (but not into a mould) about 6in. or 7in. in diameter and about 13in. or 14in. high. It is then cut down the height, and placed in a flattening kiln, to come out a flat sheet about 21in. to 23in. long. It is in the process of flattening that the glass loses some of its brilliance. In this manufacture there are also gold pink on Venetian opal, blue on Venetian opal, and gold pink and blue on Venetian opal. The Venetian effect is a ripple or indentation in the glass, which gives it greater brilliance than the flat antique possesses. The opal is the base, and when a thin skim of blue is flashed upon it it produces a varied cool green tint, with streaks of blue. The gold pink is a thin skim of gold flashed on the opal base, the warm tone of the opal softening the sharpness of the pink; the colour produced by the gold. The streaks of blue and gold pink on the opal produce beautiful combinations, often with markings of a feather-like character. This is very good to work away from the gold-pink with. All these are very valuable for special effects. Powell's also make their glass into circles of about 12in. to 14in. diameter. These are much richer than the flat sheets, of which they seem to be a concentrated form. Before leaving the subject of the quality of the material, it will be well to devote a little attention to one colour, the most important in a stained-glass window, namely, ruby. Indeed, it may be called the touchstone of a



DOORPIECE. D. WHITTET, ARCHITECT.

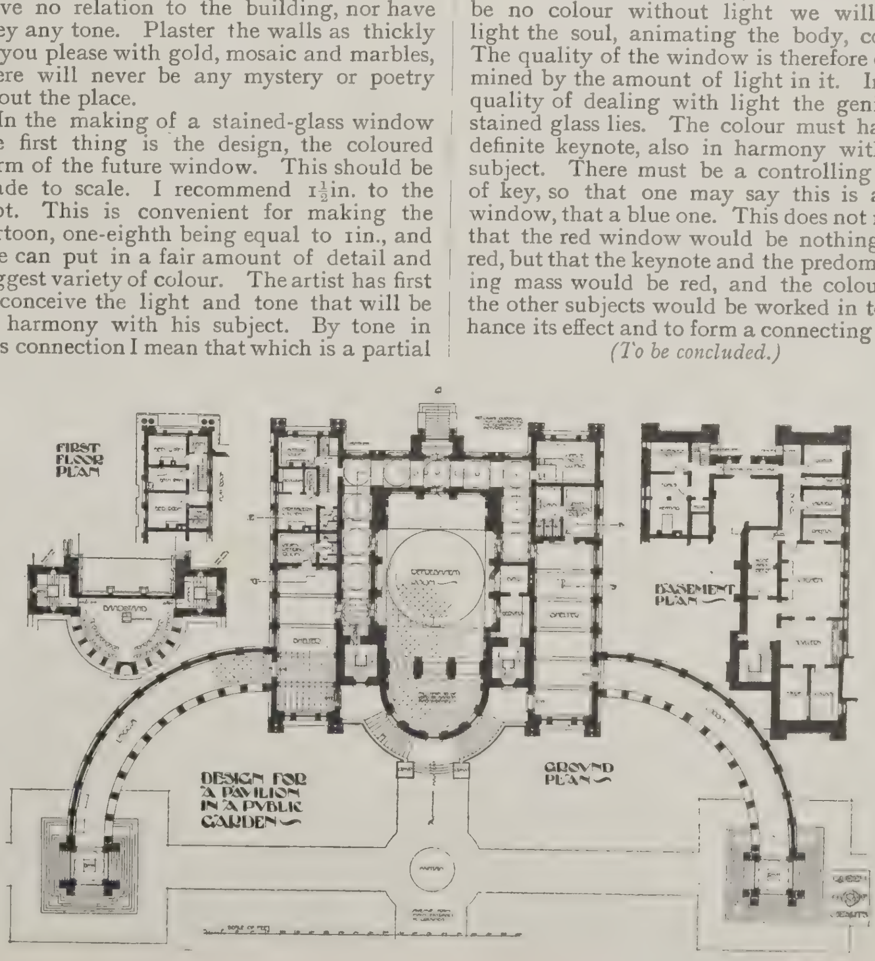
DESIGN SUBMITTED FOR THE R.I.B.A. TITE PRIZE, 1903, BY "QUEEN OF HEARTS."

window, so far as the quality of the material is concerned. There are two metals which produce the red colours we call the rubies: gold and copper. Ruby is one of the flashed glasses: that is, a base of white, amber, green tint, pale blue, or purple is flashed over with a thim skim of either of those metals. Gold ruby is confined almost entirely to "Early English," in which it reaches a price calculated to freeze your young blood and make each particular hair stand on end. You will easily understand that there must be a considerable difference in the cost of these two kinds of ruby; nor will you have much difficulty in guessing which kind is so fondly embraced by the commercial and imitation people. It will be difficult to give you much idea of the enormous difference between the two. Gold ruby is the most distinguished colour, an aristocrat among colours; whereas copper ruby is common and vulgar. Gold ruby is one of the triumphs of Prior's "Early English" glass, in which it provides an infinite variety of rubies, from the richest wine colour to the most delicate and ethereal tints. This variety is partly due to the varying thickness of the gold flash, and partly to the different kinds of base, which also varies in thickness. Spoilt ruby is also another fruitful source of variety, that is, overfired, or when the metal in the pot, decreasing in quantity, becomes too hot. Spoilt in the sense that the maker has missed his aim, but invaluable to those who seek after unique effects. Not that copper ruby is to be entirely ignored. The darkest tones of copper ruby on blue may be used as a subsidiary red, but it can never take the place of gold ruby as the chief mass of red. Powell's brown ruby; a little gold (generally too little gold) mixed with the brown flash, leads to very varied reds, generally of a sombre sort, which may be used in a similar subsidiary sense. Having shown you *which* are the best materials, I must say that architects are extremely lax in the matter of seeing that they get them in stained glass. If it were a matter of drainpipes they would study all the different kinds and specify those of a particular maker; they have a dim sort of idea that if they did not do that, some cheap and inferior quality would be foisted on them. Ah! you will say, but stained-glass is a sacred art; its makers could not do such things: why, therefore, take such precautions? If such be your touching faith, there is nothing more to be said; yet would it not be worth while to enquire where all the rubbishy glass goes to, and why there so little good glass made, that one is absolutely forced to plate a great deal more than one would? To plate is a technical term meaning to lead two or three thicknesses of glass together. I do not see why architects should not specify Prior's "Early English" glass and Powell's "Antique."

Some of you may be under the impression that we put windows in to give light. That is not so with stained-glass: a stained-glass window should be put in to give tone. You may deny this, but I say that, however much you may strive, you will never get mystery or poetry into your buildings otherwise. The Catholic Cathedral at Westminster is a glaring instance. The architect's ideal of stained-glass was a gin bottle. He has tried to get as near to that as possible with roundels and Norman glass, that cheap imitation of Early English. The windows have no relation to the building, nor have they any tone. Plaster the walls as thickly as you please with gold, mosaic and marbles, there will never be any mystery or poetry about the place.

In the making of a stained-glass window the first thing is the design, the coloured germ of the future window. This should be made to scale. I recommend 1½in. to the foot. This is convenient for making the cartoon, one-eighth being equal to 1in., and one can put in a fair amount of detail and suggest variety of colour. The artist has first to conceive the light and tone that will be in harmony with his subject. By tone in this connection I mean that which is a partial deprivation of a particular light, and must not be confounded with light and shade. To give the most familiar instance, moon, light and tone. We see objects that the moon does not shine on cooler in tone than they are in daylight, because the light of the moon is cold. In the same way, whatever light the subject demands, the tone must correspond. Every colour in the window, therefore, must be influenced by either the light or the tone. Colour, which is our next consideration, has hitherto been said to be the chief thing in stained glass. But that is not so; there is a higher aim—mystery, the result of effects of light and tone: the absolutely indispensable quality in a stained-glass window. In a window we are dealing directly with light; there is therefore no need to conventionalize it, and as there can be no colour without light we will call light the soul, animating the body, colour. The quality of the window is therefore determined by the amount of light in it. In this quality of dealing with light the genius of stained glass lies. The colour must have a definite keynote, also in harmony with the subject. There must be a controlling sense of key, so that one may say this is a red window, that a blue one. This does not mean that the red window would be nothing but red, but that the keynote and the predominating mass would be red, and the colours of the other subjects would be worked in to enhance its effect and to form a connecting link.

(To be concluded.)



THE GREAT RUINS OF RHODESIA.

RHODESIA, with a past lost in the mists of antiquity, has never attracted the attention it merits from the archæologists at home, says the Buluwayo correspondent of the "Morning Post." Many people have read Mr. Rider Haggard's "King Solomon's Mines" and "Alan Quatermain," but few have suspected that a substratum of truth underlies the romance of the records. It was vague rumours of mighty stone-built structures and old workings for gold in the interior around which the stories were built. But though the reports were regarded as mere travellers' tales they have proved to be substantially accurate.

"The Khami ruins are easy of access from Buluwayo, being but twelve miles distant, but I was told that I should start at Zimbabwe, where there are the most extensive and striking of the remains of past ages . .

"The Zimbabwe ruins are not picturesquely situated. The great kopje on which many of them are to be found shows precipitous faces of bare rock, which the builders have surmounted with considerable engineering skill. It is crowned by great walls, and huge granite boulders, which are overgrown with trees and bushes of all descriptions, the giant euphorbia attracting attention by its quaint appearance. There is another group of ruins on the ground below . . . On one point all authorities are agreed—that these massive works are not of Kaffir origin; and as it seems indisputable that the Kaffirs have been in the country for quite two thousand years the remarkable buildings must be of an antiquity respecting which the archæologist may well speculate.

"I am informed that the ruins in all parts of this region are much of the same type, consisting of dressed granite blocks placed without mortar in even courses. At Zimbabwe the walls of the great Temple still stand 30ft. high, and in some parts they are 15ft. thick at the base. The building is roughly circular or elliptical in shape, and about 300ft in length. Round the wall to the south are two rows of stone of a carefully executed zig-zag pattern. The three entrances are all towards the north, and are simply gaps in the wall, which is rounded off on both side of the apertures. Inside there is a perfect labyrinth, but the clearing which is now being effected by the Government—otherwise the Chartered Company—is gradually evolving out of the chaos some sort of order. It is to be regretted that a qualified archæologist has not been put in charge of the work. It appears to have been executed with considerable discretion, however . . . The most striking features of the interior of the temple are the great cone and the passage which leads up to it from the most northerly entrance. The passage follows the contour of the outer wall, and is from 2ft. to 3ft. wide, only opening out a few yards from the cone itself, which is at the southern end of the building . . .

"The cone . . . is, like the walls, formed of small dressed blocks of granite. Several explorers have proved it to be solid throughout by making great holes in the sides—a proceeding which seems scarcely to have been justified even for purposes of antiquarian research. It is, of course, the symbol of nature worship as practised by the Phœnicians and other races . . .

"It will be a matter for congratulation when the recently-published ordinance for the preservation of Rhodesian monuments of the past comes into force. The amount of destruction which has taken place since the occupation of the country is declared to be very great, and I am sure that all archæologists cherish the hope of the Rhodesia Scientific Association that the legislative measure will soon become law."

DUSTBIN MORTAR, AND OTHER MATTERS.

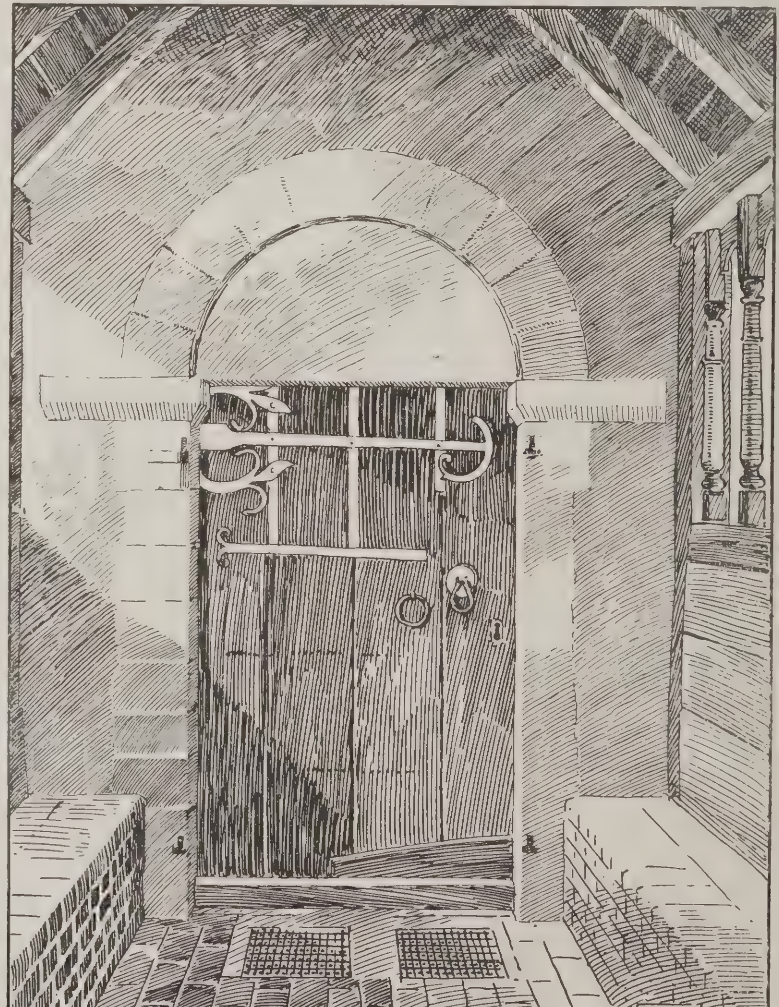
IN the course of his recent presidential address to the Institute of Sanitary Engineers Mr. W. J. Dibdin, F.I.C., F.C.S., referred to the use of dustbin refuse for mortar-making. "From a considerable experience in the examination of building materials," he said, "I am enabled to assert most definitely that such a material as dustbin refuse is the most objectionable which can be employed. I have frequently had samples of mortar used for domestic buildings submitted to me which have been made with decomposing and evil-smelling materials, and which have been covered with a fungoid growth feeding on the organic refuse contained in the mortar.

"The systematic way in which a certain class of builders seek to evade the by-laws as to the use of proper materials is a blot on the industry of the day. High-class builders of standing will, of course, not condescend to such practices, which will only cease when it becomes understood that dishonest work of this nature is as wrong as any other dishonest practice which comes under the criminal law. Sanitary engineers should be thoroughly alive to the quality of the materials employed, and ruthlessly reject any which do not comply with the fundamental principles of their calling.

"Another insanitary practice is the steady neglect in many cases to provide an effective damp-course. In how many cases of new suburban residences do we see the walls in such a damp condition as to render rheumatism and its allied complaints all but a certainty? Given a defective damp-course, a damp soil, and mortar constructed of unsuitable materials, and we have conditions which make for bad health.

"Another point which is still much neglected is the provision of bathrooms in connection with small property. Although it is universally admitted that the greatest factor in a clean bill of health is personal cleanliness, yet large numbers of houses continue to be erected without this elementary safeguard against disease. Even under the best conditions the public bath is but a sorry substitute for the private domestic one. Sanitary engineers should look to this and make it part of their creed that no house worthy of the name should be considered fit for habitation unless it is supplied with a bath, preferably with hot- and cold-water supply. Formerly such a thing was looked upon as a wonderful luxury, like clean sewers, clean roads, clean dustbins, &c., but now we know that it is a real necessity for all really sanitary communities.

"The quantity of sanitary work yet to be done is enormous. 'Society' may take the lead with glass shelves for pantries, and other sound refinements, but that is not enough. Landlords have done and are doing good work in improving the conditions of life, but still much—very much—remains to be done, and that great enemy to health the 'jerry-builder' to be absolutely annihilated. He must be improved off the face of the earth. . . ."



WHITE·RODING·CH: ESSEX·SOUTH·DOOR·

THE L.C.C. BUILDINGS AT MILLBANK.

On Wednesday last their Majesties the King and Queen paid a private visit to what is officially described as the "London County Council's estate of working class dwellings at Millbank, Westminster."

There are at present seventeen blocks of dwellings which have been erected at a cost of more than £200,000. They are practically all of two and three rooms, the total number of persons provided for being 4,430.

After lengthy negotiations as to the site the Council, in November, 1896, approved the plan for laying-out the estate as prepared by their architect. In the following February he was directed to prepare plans of some of the dwellings. With regard to the remainder the Council decided, in view of the important position of the site, to invite from selected architects competitive designs for a specimen block of dwellings from which, if found suitable, other dwellings might be erected. Mr. W. D. Caröe was appointed as assessor, and a sum of £300 was set apart to be divided amongst the competitors in such proportion as the assessor might determine. By adopting this course it was thought that the Council would obtain the benefit of the experience of architects who had given special attention to this class of building, and would moreover have the advantage of the criticisms of its own architect upon such plans.

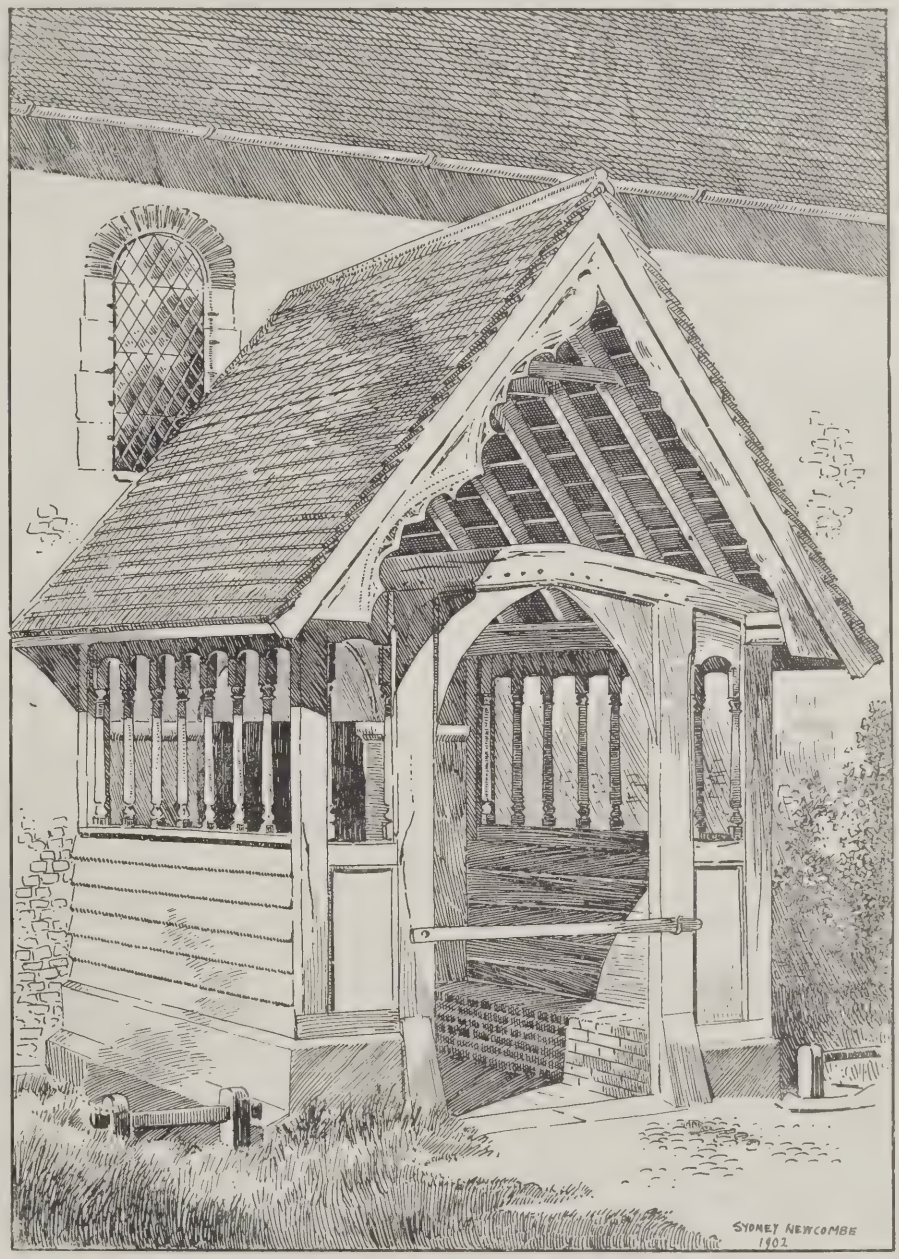
The Council's architect proceeded with his plans, and in due course the execution of the work was begun in December, 1897, and the dwellings completed and occupied in May, 1899. They received the name of Hogarth Buildings, the other blocks on the estate also being named after British artists. Plans for two further blocks of dwellings, named Leighton and Millais buildings, were completed in 1898. As the manager of works did not see his way to undertake the erection of these buildings at the architect's estimate, tenders were invited from selected firms, and in April, 1899, the Council accepted that of Messrs. Holloway Brothers. The buildings were completed in July, 1900. Plans for Romney, Rossetti, Turner and Ruskin buildings were completed in the spring of 1899. They were commenced by Messrs. Holloway Brothers during the following summer and completed by April, 1901.

At the commencement of 1899 Mr. Caröe made his competition award, the first premium of £150 being obtained by Messrs. Spalding & Cross. The Council then considered whether it would be possible to erect a block of dwellings according to Messrs. Spalding & Cross's designs without involving any charge upon the county rate. After much consideration and alteration in the detail of the plans, however, this was not found possible, and the Council's architect was instructed to proceed with the preparation of plans for the remaining ten blocks of dwellings to be erected on the estate; so that the plans of the whole of the buildings, as well as the general design for laying-out the estate, have been prepared by the Council's superintending architect—at first Mr. Thomas Blashill, and later Mr. W. E. Riley, under whose supervision the greater portion of the dwellings have been erected.

The estate lies at the back of the Tate Gallery, and was originally an island enclosed between the divergent branches of the River Tyburn. This stream took its rise on the slopes of Hampstead, and after many windings in an almost uniformly south-eastern direction crossed the site of the present Buckingham Palace. The greater portion of the district enclosed lay below the level of high tide, and in early times must have been a mere morass. To prevent inundation a wall was erected, and was known as Millbank from the fact that the adjoining mill belonging to the Abbey of Westminster was an important feature.

Millbank Penitentiary was erected on the site at the beginning of the nineteenth century.

Competitive designs were invited for the new buildings, the first prize being obtained by William Williams. Mr. Hardwicke was appointed the architect to carry out the designs. The site presented great difficulties: so that the ultimate cost of the prison was £450,130, an increase of £147,715 over the original estimate.



PORCH, WHITE RODING CHURCH, ESSEX.

WHITE RODING CHURCH.

The church of White Roding, Essex, in the country between Ongar and Dunmow, consists of a nave, chancel, porch and west tower. It is of Early Norman foundation; the nave and chancel are of this period. The materials of the early walls are chiefly unwrought flints, with occasional tiles and pieces of stone; the mortar joints are, comparatively, very wide. The idea evidently was to make all the quoins of walls and jambs and arches of doors and windows of ashlar work, but the extraordinary feature is that while the north and south doorways are thus carried out and are quite good examples of the simpler type, the supply of stone appears to have run short when the walls were raised up to about half their height; only the quoins below this level, and the sills and jambs of the windows—in some cases as far up as the springing of the arch, and in others for a couple of feet below—are of worked stone; the remainder, including all the window arches, are finished with bricks. Again, at the time of the building of the tower, which is a finely-proportioned structure of fifteenth-century date, surmounted by a lead spire, the same difficulty appears to have arisen; but with this difference—all the corner quoins, windows, doors and other details are of ashlar, while the walls themselves are an odd mixture of red brickwork-flints of the same nature as in the nave walls, and occasional rubble. The difficulty was overcome this time by projecting all the worked stone slightly beyond the general face of the wall, which was afterwards covered by a thin layer of stucco. This is in great part still left, and one hopes that subsequent restoration will not remove what is a most valuable evidence in this connection, as, speaking generally, there is no doubt that the outer walls in numbers of these early buildings were intended to be so covered, except in parts where wrought stone was used.

NEW LONDON THEATRES.

SEVERAL theatres are projected for erection in London, partly to make up for several that are going or have gone. In the construction of the new Holborn-to-Strand street, Kingsway and Aldwych, two theatres are demolished; the old Opera Comique in the Strand has already been pulled down and the old Gaiety is soon to follow, it only awaiting the completion of its new home, which is now approaching completion, so far as its outward carcase is concerned, from the designs of Mr. R. Norman Shaw, R.A., and Messrs. Ernest Runtz & Co. The theatre is expected to be finished by the beginning of August, and the restaurant in eighteen months' time. Steady progress has been made with the interior of the new theatre. The roof is on over the auditorium and the stage; the ironwork for the dress circle has been completed, and that of the two other tiers is well in hand, while the concrete in the stalls, pit and dress circle is being laid down. The three tiers are, of course, all built on the cantilever principle, and from each there will be two exits—one to the Strand, and the other to Aldwych. The theatre will have eighteen boxes, and is estimated to seat 1,200 persons.

The "Lyceum" is up for auction, and probably when sold will be rebuilt, although it would then have to face the competition of two new theatres that are shortly to be commenced—the one for Mr. E. G. Saunders, the manager and proprietor of the Coronet and Camden Theatres, and the other for Mr. Murray Carson. These two theatres, together with a large hotel, will form one entire block, with a 400ft. frontage, on the opposite corner of the crescent from that on which the new Gaiety Theatre is being erected, and will have collectively 700ft. of frontages in Catherine Street, York Street and Drury Lane. The whole block has been designed by Mr. W. G. R. Sprague, the well-known theatre architect. Mr. Saunders's theatre occupies the finest position at the corner fronting the Strand. This theatre will have a corner tower rising above the main entrance to a height of 126ft. It will be a three-tier house. The whole of the crush-rooms, which will be 20ft. wide by 40ft. long, as well as the staircases and corridors leading to the best parts of the house, will be lined with marble, which will be extensively used throughout the scheme of decoration. Above the crush-rooms there will be a circular balcony, off which will be the principal foyer. The stage itself will be 70ft. wide by 36ft. deep, the height from the footlight level to the grid being 60ft. There will also be a clear auditorium width of 50ft., with a depth of 76ft. from the curtain line to the back wall of the pit. The frontage of the whole pile, consisting of the two theatres, with the hotel in the centre, will be of white Portland stone. The central block will be uniform, and French Renaissance in style. The superficial area of the hotel itself will be 24,000ft., as against 11,000ft. allotted to Mr. Saunders's new theatre, and 12,000ft for the companion playhouse which is to be built for Mr. Murray Carson, and which will have a site equally advantageous to the other—that is to say, there will be thoroughfares on three of the four sides of the building. Though the exterior will be uniform with Mr. Saunders's house, even to the corner tower, surmounted by a dome and figure, the former will nevertheless be a two-tier house, though by some ingenious architectural arrangements that have not been introduced into London theatres before it will have all the effect of a three-tier house. There will be a very fine stage 70ft. wide, with an exceptional depth of 60ft. from the curtain line to the back wall. The auditorium will be 80ft. deep. Building will be begun in about three months' time.

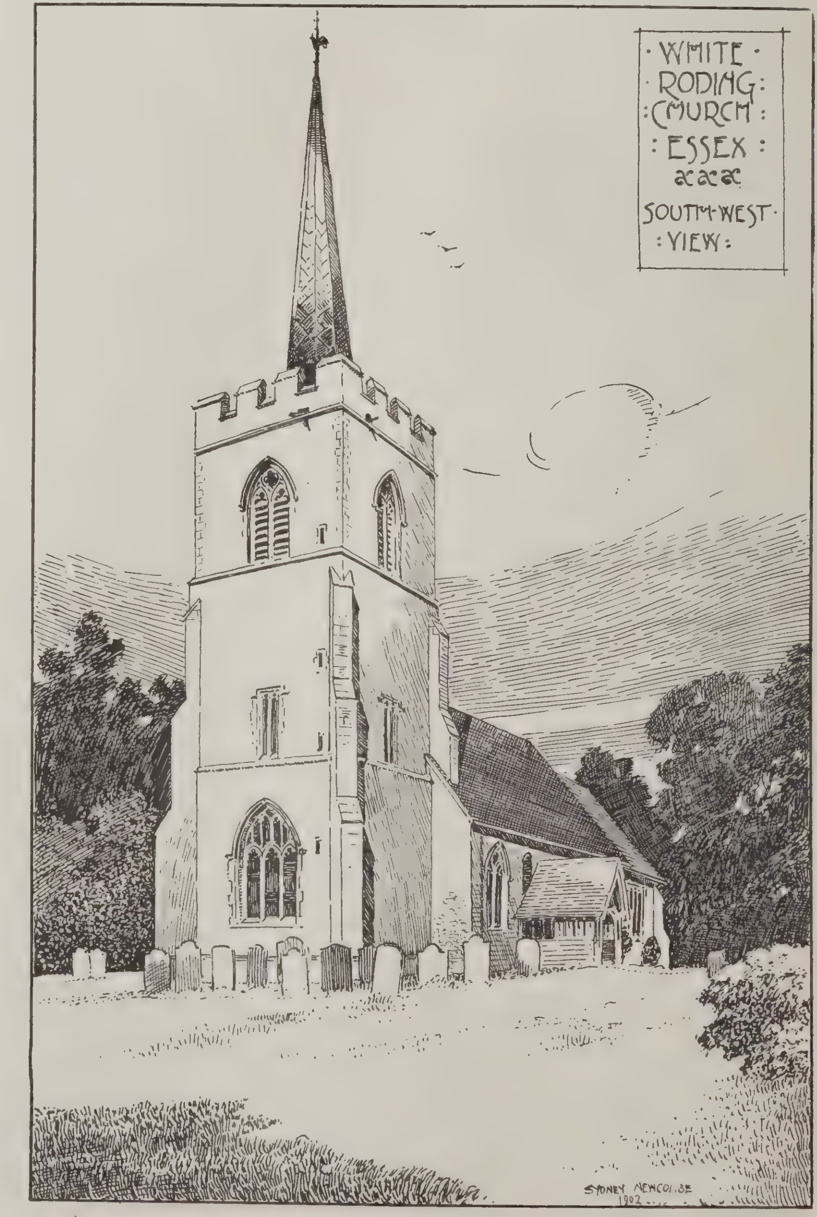
MODERN CHURCHES.

IN the course of a lecture on "Ecclesiastical Architecture" which he recently delivered at Dundee, Mr. Leslie Ower said that before there could be real progress clergy and laity, including architects, must shake off the restraints of mediævalism and archæology, and see that the buildings were the most convenient for the requirements of worship.

The criticism of the beadle of Mains to Dr. Robertson on Glasgow Cathedral—that he was "sair fashed w' thae pillars"—contained the spirit of what he (Mr. Ower) would endeavour to enforce. It was undeniable that pillars were a great "fash" to a modern church, and it was equally undeniable that in these days they were wholly unnecessary. The important part of their church service was the sermon, and it was highly desirable that all the congregation should see and hear the preacher without obstruction. He did not mean to say that no modern church should be built with pillars separating nave and aisles; but where it was so it should be of such a size that the nave only was used for service, leaving the aisles for passages or spaces for grandeur of effect. The best results in church architecture, like most other things, were only to be arrived at by a strong application of common-sense, by studying carefully the essential purposes which the buildings have to fulfil, and designing them in the way most likely to serve those purposes, regardless of precedent or conventionality to begin with. But that did not of necessity mean that their feelings must be hurt by an absolute departure or radical change from everything round which their religious sentiments might cling.

Mr. Ower afterwards discussed the various architectural features and furnishings of a Scotch church. With regard to the Communion table, he said many of them could remember when there was no such thing to be seen in the church except on a Communion Sunday. It had savoured so much of the altar as to be highly objectionable to our forefathers, and it was only now, when the old Reformation spirit was growing weak, and the memory of the trials they endured and the sacrifices they made for Presbyterian forms of worship was passing into the dim and distant part, that the Church was content to tolerate and even to desire such an innovation.

Discussing, in conclusion, what scope should be allowed to the fine arts in connection with religious buildings, he said there might be all degrees of opinion, from the severely simple to the highest elaboration. And probably, as usual, the judicious course was a happy medium which, while yielding to the more enlightened and artistic spirit of our time, was yet able to make a stand against those extremes which would tend to convert religious services into entertainments, and extinguish the spirituality of them in empty ceremonials and observances.



Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

A Tower, and Right of Light.

CARLISLE.—STUDENT writes: "The top of a tower 4ft. sq. being at a greater angle than 45 degs. to the ground-floor window-sills of the houses opposite, could the owners claim 'right of light' and prevent the tower being erected; or what could be the maximum width of the tower? The houses have been built for more than twenty years."

The angle of 45 degs. has nothing to do with the question, in spite of a very general belief to the contrary. If a material loss of light to the old windows can be proved, caused by the projected building to a greater height than previously, then the new building can be stopped by injunction, or damages can be claimed. A solicitor should be consulted at once and very prompt action taken, else it might be held that tacit consent had been given to the obstruction. G. A. T. M.

Oak-Block Floors.

LONDON.—J. H. T. W. writes: "What is the best treatment for English oak wood-block flooring? How should it be cleaned, polished and kept in order, so as to ensure the gradual toning of the wood to the colour which English oak eventually assumes?"

For an oil polish nothing more than pure raw linseed oil is needed, though sometimes 50 per cent. of boiled oil is added. The latter gives a gloss with less "elbow grease"—the principal factor in oil polishing—than does the former. Oak will darken very slowly if the surface is "finished" in any way, hence it would be well to stain the oil with some finely-ground pigment, such as burnt umber. The oil may be applied with a brush and left to sink in; the floor should then be rubbed with cloths until the surface is dry and shines sufficiently. Little after-treatment is necessary beyond an occasional rub to preserve the polish; but after the preliminary treatment with oil, wax polish may be used. It is composed of wax (beeswax is best—tougher) dissolved in turpentine, and is used of the consistency of butter in hot weather. Rub in with a woollen cloth. Polishing is usually done with brushes. H. E.

Heightening a Party Wall.

QUERIST writes: "I have bought a row of cottages, and wish to build at the back of each a scullery with bedroom over. The end house adjoins a similar class of property which already has the same accommodation. The wall between this and my property is a party wall, being 9in. brick between the yards and having half-round brick coping. The adjoining owner objects to the yard wall being heightened as required. Can he legally do this? Can I build a half-brick wall on my own side to the height of present coping, cut out half of the latter, and continue up a 9in. wall from that point?"

You have *prima facie* a right to do as you suggest with the party wall, subject of course to any qualification or modification of your rights which may have arisen by virtue of the Statute of Limitations or otherwise. From your point of view I think the chief danger lies in any rights (which are in the nature of easements) which the Statute of Limitations has sanctioned. I am not able to state from the facts as presented whether or not such easements exist. Several very important factors necessary to arrive at an accurate decision have not been stated. You do not say how you and the adjoining owner hold your houses—whether in fee simple under a lease, or under a sub-lease, and for what term; whether under the same or different owners, and the respective dates of the erection of your house and that of the adjoining owner. Space will not permit me to discuss the possible effect of each of these factors on your position. The law affecting cases similar to yours may be roughly stated as follows:—Where an owner of land permits an adjoining owner to erect a house, building or structure which obscures the light or hinders the access of air to his plot, and where he permits them to remain for a period of twelve years, the Statute of Limitations gives the adjoining owner a right or easement over the land, whereby the owner is prevented from doing anything which would interfere with it. The tenement or holding over which the right is sought to be exercised is called the *servient* tenement, and the tenement which exercises the right is called the *dominant* tenement. If the owner of the dominant tenement and the owner of the servient tenement are one and the same, the statute does not run; neither does it run if the easement was enjoyed by *permission* of the owner of the servient tenement. The question in your case is, Has the "adjoining owner" acquired such an easement against your land? If he has he can prevent you from building; if not, he cannot. From the data above given you should be able to solve the question for yourself. W. JOHNSON ROBERTS.

Metal Tiling.

TEIGNMOUTH.—T. R. writes: "Who is the maker of a patent tile composed of zinc, lead, &c., for fixing on plaster or woodwork?"

The London Tablet Co., Ltd., Sydenham, London, S.E., are the manufacturers of a material known as "Mezotil," which is made to represent glazed tiles. It consists of enamelled sheet zinc, and can be fixed to any surface. T. E. C.

Land Tax.

MANCHESTER.—J. C. writes: "This year for the first time I am charged with a land tax of 1d. in the £ on nine-tenths of the yearly rental of cottage property at 4s. 9d. per week. Is this a new charge by the income-tax authorities on whose form payment is demanded? I may say that the ground is leasehold and subject to a chief rent. Furthermore, my income from all sources does not exceed £400. Am I able to have 50 per cent reduction from the tax imposed, as stated?"

Land tax is by no means new, it having been first imposed as a temporary measure in the reign of William and Mary, and made a permanent charge in 1798. Each parish in the kingdom has to provide its fixed quota of tax, so that if one assessment gets reduced some other or others has to be raised in order to make good the deficiency. Why you have not previously been assessed cannot be determined other than by local enquiry, but the previous sentence may provide a key to the solution of the question. As your income does not exceed £400 you are entitled to an abatement of one-half the amount of the tax; and as the amount you will have to pay is so trifling it would probably be worth while to redeem the tax by payment to the Inland Revenue Commissioners of a sum equal to thirty times the amount charged, and thus end the matter once for all. It is of course not impossible (as an explanation for the previous non-imposition of the tax) that the land tax may have already been redeemed, and its re-imposition therefore a mistake; but if so the deeds would probably show it. This point could be determined on application to the Registrar of Land Tax, Somerset House, London, W.C. W. H. C. E.

Mensuration.

LONDON.—J. R. P. writes: "(1) What is the relation between the angle at the apex of a cone and the angle made by the sector which results from flattening out the surface? (2) How is the radius determined of a semicircle equal in area to a given half-octagon?"

(1) Referring to the illustration below, let d = diameter at base of cone, α = angle at apex, c = circumference of base of cone and length of arc of sector, β = angle of sector, h = slant height of cone, C = circumference of completed circle of sector, π = ratio of circumference to diameter = 3·1416.

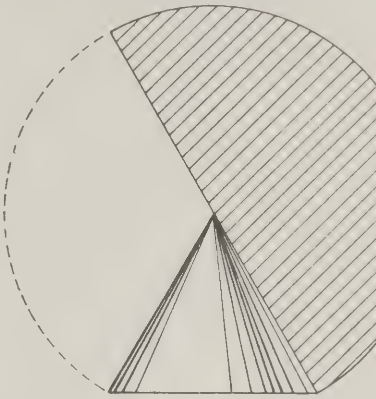


Fig. 1

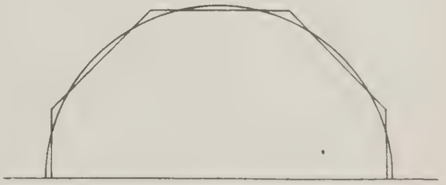

Fig. 2

Then $c = \pi d$, $h = \frac{d}{2} \times \sec. \left(\frac{180 - \alpha}{2}\right)$.

$\mathrm{C} = 2\pi h$, $\beta = 360 \times \frac{c}{\mathrm{C}}$ $\therefore \beta = \frac{360}{\sec. \left(90 - \frac{\alpha}{2}\right)}$.

Example: Angle at apex of cone, 60 degs.; diameter of base, 12in.; then angle of sector

$$= \frac{360}{\sec. \left(90 - \frac{\alpha}{2}\right)} = \frac{360}{\sec. 60} = \frac{360}{2} = 180^\circ,$$

as in Fig. 1. (2) The area of an octagon in sq. in. is 4·8284 times its length of side in inches. The area of a circle in sq. in. is ·7854 times its diameter in inches squared. There will be the same relationship between a half-octagon and semi-circle. Example: A semi-octagon 1in. side has an area of $\frac{4·8284}{2} = 2·4142$ sq. in.; and a semi-circle having an area of 2·4142 sq. in. has a diameter of $\sqrt{\frac{2·4142 \times 2}{·7854}} = \sqrt{6·147} = 2·48$in. as in Fig. 2. HENRY ADAMS.

R.I.B.A. Testimonies of Study.

TODMORDEN.—PROBATIONER writes: "Will you kindly name some buildings about Todmorden suitable to measure for the R.I.B.A. testimonies of study."

SOUTHPORT.—VIGNOLA writes: "Is there an Early English or Decorated doorway in this neighbourhood suitable as a testimony of study for the R.I.B.A. examination?"

So far as I can ascertain there is nothing suitable for the purpose in either of the districts named. Possibly, however, some reader acquainted with the neighbourhood may be able to assist us. Generally speaking, students who reside where there are no good specimens of old work would do well to obtain a few weeks' special leave from their offices during the spring and summer and spend the time in some such place as Lincoln or Ely, first obtaining a special permit to measure portions of the cathedral from the Dean. In one instance within my own knowledge a student measured one of his Orders in the British Museum, where he also did his sheet of Classic Detail; his Gothic sheets were measured at Westminster Abbey, except one window, which was measured at Amiens; his timber roof came from Reims Cathedral, and his other Order from Cologne. The measured sketches for the foreign work were all made during two short visits to the Continent—one at Easter and the other at Whitsuntide—in my company.

G. A. T. M.

Filtering Water from a Village Supply.

STOW-ON-THE-WOLD.—W. E. B writes: "A village with about 100 inhabitants is supplied with water through a 2in. iron pipe Can I get get any kind of a filter to fix in the pipe, or must I build a filter bed in the ordinary way if I decide to make an attempt to purify the water? The pressure is not great, about 30ft. head of water, and the supposed contamination is very slight."

The water may be filtered by means of a filtration apparatus connected to the main. Various systems have been devised, amongst which may be mentioned the Pasteur (Chamberland) filter, manufactured by Messrs. Defries & Sons, Ltd., 147, Houndsditch, London, E.C.; the Hastings polarite filter, manufactured by The International Purification Syndicate, 109, Victoria Street, Westminster, S.W.; Halliday's high-pressure self-cleansing filter, manufactured by Messrs. Halliday & Co., Portland Works, Water Street, Ashley Lane, Manchester. So much depends on the nature and quality of the water supply and, on the various local conditions, that any decision as to the most suitable and economical method of filtration to be adopted—whether by filtration plant or ordinary filter beds—should be a matter of careful consideration. Your best course would be to call in the assistance of an expert engineer, who could make himself intimately acquainted with all the details of the case.

T. E. C.

Rating of Builder's Plant.

HEXHAM.—A. Y. T. writes: "What part of a builder's plant is ratable? I have been in business for a long time and have never been rated until now. Can machinery, mortar mills, and mason sheds on a new building in progress be rated, or the land outside the building on which stock is lying that will be needed in the new building? Assuming that they can, there will also be income tax to pay on the assessment, and no credit has been allowed in the accounts for these charges as business charges, as no rent was paid, yet in the new assessment they will be treated as a source of income."

Personal property being exempt from poor rates, no part of a builder's plant is ratable, but, reading between the lines of the query, the facts would seem to be that a certain portion of land has been lying idle and untenanted, and has therefore been exempt from the burden of rates. Building has now commenced, sheds have been erected and machinery fixed, and a portion of the ground has practically been converted into a builder's yard. As such it is clearly liable for rates. And it has been decided by the courts that machinery attached to a building or to land is liable to be rated; and, as an extreme case, it has been held that a billiard table, if let with the house in which it stands, is liable to be assessed. Assessments are usually made up to the hilt; and if in the present case the amount is thought excessive an appeal for its reduction can be lodged. Yes, there will also be income tax to pay "in respect of the property in lands, tenements, &c. and on the annual value thereof." The fact that nothing has been allowed for in respect to these charges will avail nothing probably, though an appeal may be tried. In the case of a single house, or a pair being erected no charge would, most likely, have been made; but as it would seem that the development of an estate is in progress, and that the sheds and machinery are likely to remain for some time, there seems little ground for claiming exemption from payment of rates and little prospect of such a claim being allowed.

W. H. C. E.

Lime Kilns.

BATH.—J. L. write: "Will you kindly give a list of the chief points to be observed in erecting limekilns, or state where we can obtain information concerning lime-burning and see the most modern process."

In the space of this reply it would be impossible to give particulars of the various forms of kilns and their respective merits for different objects. If our correspondents will consult "Specification, No. 4," 1899 (10s. nett), they will find an article on "Lime Kilns: Their Design and Construction," by Charles T. Ruthen, C.E., illustrated by plans and sections. In "Specification, No. 5" (5s. nett), Mr. Ruthen contributes a further article on "Lime Kilns: Their Working and Management," with illustrations of time- and labour-saving devices used on modern lime-burning works. "Specification" (Nos. 4 and 5) can be obtained from our Publisher at 6, Great New Street, E.C. These articles deal with the constructional and equipment sides of the work. There is a treatise on "Limes, Hydraulic Cements and Mortars," by Q. A. Gillmore (U.S.A.), published by E. & F. N. Spon, 125, Strand, W.C., at 18s. One of the chief points Mr. Ruthen calls attention to is the question of the site: "The position selected for the erection of a limekiln has a great deal to do with the satisfactory working, after erection, both as regards the quality of lime turned out from the kiln and the economy in working the same. It is preferable, where possible, to build kilns on the face of a steep bank, with an inclined roadway leading to the top or, better still, in such a position where there is a railway siding at the top level. The coal and stone can then be carted or brought in by rail, as the case may be, to the top and from thence into the kiln, the calcined lime being withdrawn at the bottom. A position such as the one mentioned will save the great expense of lifting the limestones and coal to the top of the kiln."

Party-Walls.

ENQUIRER writes: "Two party walls divide adjoining owners A and B. A's wall was built first. B wants to buy the use of A's wall. This is declined. A put up his own wall, but did not carry it above his roof, so that another person would not know there were two walls; the slates of B's roof coming flush with A's wall, and thus letting all rain run on to A's wall. Moreover, by stopping his wall B has made use of A's coping slates, which protect A's wall-top from rain. (1) Can A make B carry his wall up beyond the roof-line? (2) Can A restrain B from using any part of his premises for B's advantage? (3) Can A claim any damage?"

(1) A cannot compel B to carry his wall above the roof-line, as such matters are dealt with under the local by-laws. The by-laws of some local authorities require that party-walls shall be carried above the roof, whilst others simply require that the party-wall shall be carried up as high on the underside of the slate or other covering. (2) Yes, as a general principle, but in the metropolis (under the London Building Act, 1894, 57 & 58 Vict., c. 213) the adjoining owner possesses certain rights to build the footings of an external wall upon the land of the adjoining owner under certain conditions. (3) Yes, if A can prove that he has sustained any material injury which has been directly caused by B; but in this particular case it would appear to be very doubtful.

T. E. C.

Technical Weeklies.

EDINBURGH.—P. J. B. writes: "What are the addresses of the 'Contract Journal,' the 'Surveyor,' and the 'Municipal Journal'?"

The "Contract Journal" is published at 139 and 140, Salisbury Court, Fleet Street, E.C., every Wednesday, price 6d. The "Surveyor" is published at 24, Bride Lane, E.C., every Friday, price 3d. The "Municipal Journal" is published at 12, Salisbury Square, E.C., every Friday, price 1d.

Defective Hot-water System.

G. F. writes: "Is the arrangement shown by the accompanying sketch (not reproduced) an efficient one for hot-water supply? It was put in about six years ago, and was quite satisfactory until six months ago, since when no hot water has been obtainable. The boiler has been taken out and found to be in order. The water-supply was short and the cistern was found empty: the range was then put out of use for a day or two, and there has been no hot water since."

The arrangement of pipes appears to be similar to what is usual with a cylinder system having no secondary circulation. The fact that the system gave satisfaction for over five years would indicate that the arrangement of pipes is all right. The trouble would appear to be in the fire. Ascertain whether the flue is clear and drawing properly. If it is, and there is water in the boiler and a fire in the grate, the water will get hot. As the pipes between the boiler and cylinder are clear, the water is bound to circulate as it becomes hot, otherwise the water will boil and the steam formed will condense in either the flow or return pipe, causing water-hammer. As no mention is made of noises I presume there are none. The trouble, therefore, is in the fire or flue.

G. A. A.

THE LONDON ARCHITECTURAL VIGILANCE COMMITTEE.

WITH this title a committee is proposed to be formed "to promote as far as possible a more dignified and rational appearance to metropolitan schemes relating to bridges and edifices."

The objects of the committee would be—(1) To endeavour to act by influencing public opinion, and if necessary to protest against the action of public authorities in refusing to consider qualified advice on the æsthetic as well as sensible treatment of public works of art. (2) To constitute a body which should be able and willing to give competent advice to public bodies when occasion arises, and to place its judgment and advice at their disposal. With these ideas in view, it is proposed that the committee shall consist only of such persons as, from their artistic position or experienced judgment, are entitled to offer advice or to undertake criticism.

At present the committee is proposed to consist of Lord Windsor (chairman), Lord Balcarres, Sir John Stirling-Maxwell, Sir E. J. Poynter, Sir W. B. Richmond, T. Brock, G. J. Frampton, Aston Webb, John Belcher, Sir Benjamin Baker, Sir Thomas Wrightson, Professor Pite, W. D. Caröe, H. T. Hare, Dr. Longstaff, M. H. Spielmann, and H. Heathcote Statham.

Correspondence.

"Recent Work in Oxford."

To the Editor of The Builders' Journal.

XFORD.

Sir,—The writer of the article on the bove subject in your issue for last week tates that street improvements are to be ade by widening Carfax, Oxford, and that esigns for the buildings were prepared by Ir. Hare. We beg to state that we are the rchitects for this work; and also of Lloyds ank.—Yours truly,

R. C. DAVY, M.S.A.
STEPHEN SALTER, F.R.I.B.A.

Old Brass Lecterns.

To the Editor of The Builders' Journal.

XETER.

Sir,—The old brass lectern in Southwell inster originally belonged to Newstead bbey. At the time of the dissolution of e monasteries (in 1535 or 1536) the monks, aving first hid their royal charter and her parchments in the ball upon which the rd is perched, threw it into the adjacent ke. There it remained until accidentally shed out in the middle of the eighteenth ntury. At the sale of the fifth Lord Byron's ffects at Newstead it was purchased by a atchmaker of Nottingham, and it was the azier who repaired it for him who found the bbey grants, &c., concealed within. The tradesman sold it in 1805 to Sir R. Kaye, Prebendary of Southwell and Dean of Lincoln, who presented it to the Minster. It bears the inscription "Orate pro anima Radulphi Savage, et proanimabus omnium fidelium de functorium."

At Queen's College, Oxford, the eagle lectern turns on a pivot, and its globe is inscribed "Aquila Regina Avium Reginensium."—Yours truly, HARRY HEMS.

Lead on Oak.

To the Editor of The Builders' Journal.

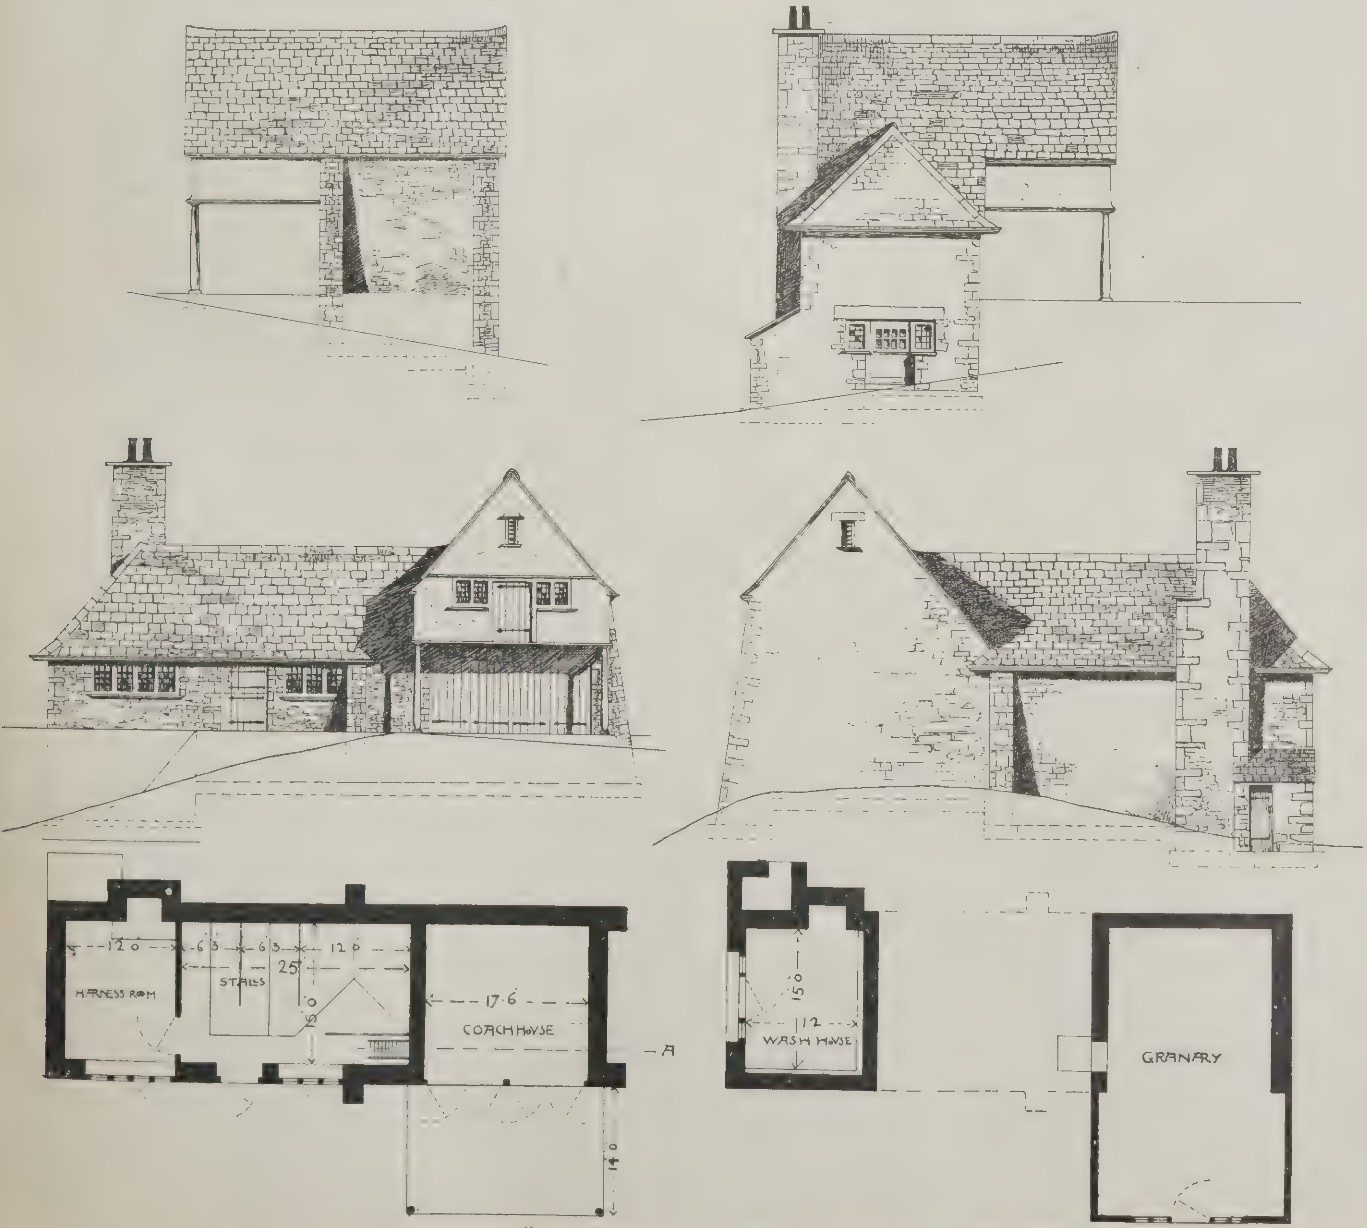
London.

Sir,—Referring to the enquiry on p. 8 of your issue for last week, I do not know from actual experience of the result as stated by Beckett (now Lord Grimthorpe) in his book on Building; but I do know that almost the last trace of silver is now taken out of lead by the desilvering process. The old native lead which was *cast* into sheets to cover our cathedral roofs contained a notable quantity of silver. Beckett says that this protected the leadwork from the corroding action of the acids of the oak; but the modern milled and desilvered lead should never be laid on oak, as the protective silver being taken out it will soon decay, and it is recommended that if milled lead be used it should be laid on deal boarding, unless, indeed, virgin lead be used with the silver remaining in it, and *cast* into sheets. Felt interposed would probably be equally injurious to the lead as it is to zinc. Care should be taken that zinc is not laid under an uncovered copper electric wire, else a galvanic action may be set up, which at times has been a source of mysterious decay.—Yours truly,

ARTHUR HARSTON, F.S.I.

The Proposed Stable at "Broadleys," Windermere, is for Mr. A. Currer Briggs, and is to be built in local stone, with local green slates for the roof in graduating courses to very large at the eaves. The only rough-cast portion is the wood construction of granary over the washing space.

Manchester Society of Architects.—At the meeting held on February 12th Mr. E. Percy Hinde, A.R.I.B.A., read a paper on "Some Elementary School Buildings." The chair was taken by Mr. J. D. Mould, in the absence of the president. The lecturer pointed out the principles that effected school planning, and showed how the new code largely modified former conditions. Plans of school buildings of various types were hung on the walls to illustrate the lecture. The subject for the Society's last monthly competition for students was a sundial. The prize was awarded to Mr. C. H. Potter, and a special prize to Mr. F. Osler. Messrs. A. Maclaren, Frank Dyer, R. J. Vernon, Q. M. Bluhm and Norman Taylor received honourable mention.



PROPOSED STABLE BUILDING, "BROADLEYS," WINDERMERE. C. F. A. VOYSEY, ARCHITECT.

Keystones.

The Lytton Memorial Tablet in St. Paul's Cathedral, which has just been unveiled, was designed by Mr. Alfred Gilbert, R.A.

The Scenes of "A Clean Slate," the new comedy at the Criterion Theatre, have been furnished by Messrs. Oetzmann, of Hampstead Road. They have also re-upholstered the stalls of the theatre.

The Temple Church.—In addition to the restoration of the belfry tower at the Temple Church, it is understood that the Temple authorities have decided that the ancient Norman porch and entrance arch of the church shall be carefully renovated and restored.

A new Lighthouse is being erected at a cost of about £30,000 on Dungeness Point, which by the accumulation of shingle is said to have extended nearly half a mile within living memory. The present lighthouse was built, after the model of the Eddystone, towards the end of the eighteenth century.

Cottages at 2s. a Week Rental.—Alderman Wakerley, of Leicester, has erected cottages on his estate at Gedding, near Bury St. Edmunds, which are let at a weekly rental of 2s., which give a return of 3½ per cent. on the capital invested, and he is about to publish the drawings and all particulars as to cost, &c. The cottages have two living-rooms and a scullery, and three good bedrooms.

Sonning Bridges.—At the last meeting of the Oxfordshire County Council the Roads and Bridges Committee reported that under the power delegated by the Council to the committee to settle finally the design and method of re-building these bridges the committee decided to carry out the original plans of the architect for providing bridges with lattice girder parapets supported on iron piles with spans of 50ft. width, according to the accepted tenders for £7,671 9s. 6d., in preference to the alternate plans for substituting heavy flat main girders, using the old iron railings as parapets, and building brick piers as supports with spans of 33ft., which involved a cost of £8,654. The work of reconstruction has advanced and the architect has given his certificate that £1,000 is due on account of the builders' work. The report of the committee was adopted.

Glasgow Technical College.—At a meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held on Friday last a paper was read by Mr. James Benson on "Leaded and Stained Glass Work." He traced the history of stained-glass work in the early ages, and the decline of the art on the introduction of oil paint, by the expounders of fine art finding in it a better medium for the expression of their ideas and emotions. In comparing the various kinds of glass used Mr. Benson stated that the best glass of British manufacture was much superior to that made on the Continent, and that it was now possible to obtain stained glass equal in tone and permanency to the fine work of the ancients. In conclusion the lecturer gave a description in detail of the process of design and construction of a memorial window. A vote of thanks was accorded the lecturer. On Saturday, February 21st, the members of this Society visited the new Elmvale School now in course of erection to meet the increasing need of school accommodation in the Springburn district. The school is from the design of Mr. H. E. Clifford, I.A., Glasgow. Owing to the inclement weather the attendance was small. The visit proved of a highly interesting and instructive nature. Several novel features of school construction were pointed out by Mr. Dale, Mr. Clifford's representative, and by Mr. Aitken, clerk of works.

Mr. J. J. Burnet, F.R.I.B.A., A.R.S.A., has been elected a corresponding member of the American Institute of Architects.

Mr. John Taylor, A.R.I.B.A., of Longton and Leek, has been appointed architect for the new electric-light station to be erected for the Leek Urban District Council.

Mr. A. Hunter Crawford, president of the Edinburgh Architectural Association, has been specially elected an F.R.I.B.A. by the Council.

The new Bridge over the Thames at Kew, which has been in course of construction for over three years, is now nearing completion, and it is announced that his Majesty the King, accompanied by Queen Alexandra, has consented to open it on some date subsequent to May 1st.

A Yorkshire Architect's Affairs.—At the London Bankruptcy Court last Thursday, J. Holmes Greaves, architect, late of Leeds and Pontefract, attended for public examination upon accounts showing liabilities £1,255 and assets valued at sufficient to provide a surplus of £604. The debtor lodged a proposal under which the creditors will be satisfied in full, and a further meeting of the creditors will be held this week to consider the offer.

Architectural Association of Ireland.—The sixth technical demonstration of this Association was held on Thursday, February 19th, at the iron foundry of Messrs. Tonge & Taggart, Windmill Lane, Dublin. There was a fair attendance of members, who were conducted around the premises by Mr. Tonge. Pattern-making was first seen in operation and afterwards the various processes involved in making moulds were executed and minutely explained. The members finally proceeded to the furnaces and witnessed the casting of various ironwork details.

The Cartwright Memorial Hall. — The Markets and Fairs Committee of the Bradford Corporation last week considered the plans for the laying-out of the grounds surrounding the Cartwright Memorial Hall, prepared by Mr. J. W. Simpson, F.R.I.B.A., of London. The plans provide for an imposing terrace on the Manningham Lane side of the hall, for the laying out of the grounds, and for handsome balustrades and ornamental gates. The plans were approved generally, and instructions were given for tenders to be obtained for carrying out the work.

Hereford Cathedral.—The Dean of Hereford, D.D., F.S.A., in lecturing on "The Evolution of Architecture in Hereford Cathedral," said that the Cathedral in itself furnished a complete series of designs in every form and variety. There were the Norman, Early and Late Transitional, Lancet Early English, Lancet Decorated English, Florid or Perpendicular, down to the sixteenth-century Booth porch, which was a beautiful example of Late Perpendicular. It would be well to endeavour to explain the reason for the great diversity of style not only in their cathedral but in other cathedrals. It must be, therefore, understood that as a general rule the builders of the Middle Ages never fell back upon a past era of their art; their sole aim seemed to have been advancement. With regard to the present condition of the building, he said that £100,000 could be well spent on it to advantage.

TO CONTRIBUTORS.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of the BUILDERS' JOURNAL, 9, East Harding Street, E.C.

Builders' Notes.

The Cottage Hospital, Caterham, is being warmed and ventilated by Shorland's patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

The Town Hall, Dumfries, is being fitted with "small tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool. The ventilation of the building has also been placed with the same firm, employing their patent tubular exhaust ventilators, which are guaranteed to be absolutely weatherproof.

Messrs. Mellowes & Co., of Sheffield, and 28, Victoria Street, London, have received the order for covering with their patent "Eclipse" glazing the roofs over new station at Wemyss Bay, on the Caledonian Railway; new sheds for machinery at Bolton, for the London and North-Western Railway; and extensions to Messrs. Swan & Hunter's shipbuilding yard at Wallsend, Newcastle-on-Tyne.

London County Council.—At last week's meeting of the Council the Finance Committee stated that the total nett debt of London outstanding was £54,257,005, an increase of 8·71 per cent. on the year. The Housing of the Working Classes Committee reported: "That the estimate of £7,500 submitted by the Finance Committee be approved, and that the freehold of the site in Brixton Hill, near the Avenue, be acquired by the Council under Part III. of the Housing of the Working Classes Act, 1890." This was agreed to.

Partnerships Dissolved.—The partnership subsisting between William James Davis, Ellen Maria Davis, Robert Edward Davis, George Frederick Davis, Herbert Morgan Davis and Frank Davis, carrying on business as bricklayers and builders, at Walsall Street, West Bromwich, under the style or firm of "John Davis & Sons, "has been dissolved from February 13th, 1903. All debts due and owing by the said late firm will be received and paid by the said Herbert Morgan Davis.—The partnership subsisting between Charles Adams Daw and William Adams Daw, carrying on business as builders, at No. 27, Palace Gate, Kensington, under the style or firm of C. A. Daw & Son, was dissolved from April 18th, 1894. All debts due to and owing by the said late firm will be received and paid by the said William Adams Daw, by whom the business has been carried on since the date or dissolution under the style and firm of C. A. Daw & Son.

The International Fire Prevention Congress is to be opened at Earl's Court on July 7th with a general meeting, followed by sectional meetings on July 8th and 9th. Several of the great Government departments, such as the Local Government Board, H.M. Office of Works and the Board of Education, have notified their intention of being represented by delegates, as have also some thirty municipalities, including cities like Edinburgh, Birmingham, &c. Further, the Metropolitan Asylums Board, several similar institutions, some of the City Companies (such as the Joiners' Company, the Tylers' and Bricklayers' Company), and quite a number of the principal technical and scientific societies, have decided to send delegates. Nearly all the great American and Continental organizations interested in the subject have already decided to send deputations. The Congress offices will be at 1, Waterloo Place, London, S.W., where particulars can be obtained from the hon. secretary. Those desiring to participate in the discussions or present papers should make their applications before the end of March.

Labour in January.—The Labour Department of the Board of Trade report that the general state of employment during January showed little change as compared with

December. It was worse than a year ago, particularly in shipbuilding and the iron and steel industry. In the 225 trade unions, with an aggregate membership of 547,671, making returns, 27,685 (or 5·1 per cent.) were reported as unemployed at the end of January, as compared with 5·5 per cent. in December. In the engineering trades the general state of employment continued quiet in January, and was rather worse than a year ago. In the building trades employment is very dull, and on the whole shows little change as compared with the previous month, but is worse than a year ago. The percentage of unemployed union members among carpenters and joiners was 6·5 at the end of January, compared with 5·9 in December and 5·6 in January, 1902. The percentage for plumbers was 6·4 at the end of January, compared with 5·6 in December and 5·8 in January, 1902. The total number of workpeople involved in disputes which began or were in progress during January, 1903, was 14,921, compared with 15,830 in December, 1902, and 26,045 in January, 1902. No new disputes of importance began in January. The seventeen that occurred involved only 2,332 workpeople, of whom 1,916 were directly and 416 indirectly affected. Of the seventeen new disputes in January, 1903, two took place in the building trades and five in the metal, engineering and shipbuilding trades. Definite results were reported during the month in the case of twenty-five disputes, new and old, affecting 4,843 workpeople. Of these twenty-five disputes, six, involving 285 persons, were decided in favour of the workpeople; thirteen, involving 2,118 persons, in favour of the employers; and six, involving 2,440 persons, were compromised. The changes in rates of wages reported during January affected about 23,400 workpeople, of whom nearly 16,300 received advances and 7,100 sustained decreases. The nett effect of all the changes was a decrease averaging 1½d. weekly per head of those affected. One of the principal advances was to 1,500 limestone quarrymen in Weardale.

Obituary.

Mr. Alfred Purkess, architect and borough surveyor of Andover for many years, died last Saturday week.

Mr. Griffith Davies, one of the partners of the well known firm of Davies Brothers, builders' merchants, of Newport, died last week at the age of fifty-six years.

Mr. William Harrison, builder and contractor, of Lancaster, who was first president of the Lancaster Master-Builders' Association, died last week in his fifty-third year.

Mr. C. Hankin, builder, &c., of Downshire Hill, N.W., an old and much-respected inhabitant of Hampstead, died recently at the age of sixty-six years.

Mr. Robert Sheach died recently at Newport, Fifeshire, in the ninety-fifth year of his age. In his native place of Ceres he started as a mason, and while young went to Dundee, where he set up as a builder, retiring about eighteen years ago. Mr. Sheach leaves two daughters and two sons, one of the latter being Mr. Robert Sheach, builder, of Dundee.

Mr. William Darlington, a well-known builder of Hexham, died last Sunday week at about seventy-four years of age. He was for many years in the building trade in partnership with his brother, Mr. Joseph Darlington, who died in 1898. The Messrs. Darlington built a number of gentlemen's mansions and other public buildings, the latter including Prudhoe church and manse and Lambton's bank at Hexham, as well as carrying out restorations at Langley Castle and Haughton Castle.

Law Cases.

Builders' Perquisites.—Before Judge Gye at Alton County Court last week Miss Emily Rose Morris, of Bentworth, sued Messrs. W. J. Drowley & Co., of Woking, for the return of a pump or its value, £4 10s., and 10s. damages. The defendants put in a counterclaim for £3 for materials retained by plaintiff. It appeared that the defendants had carried out certain alterations to a house for the plaintiff, and in accordance with what they alleged to be a well-known custom a pump was taken away and sold. Evidence was called to show that unless a special clause was inserted in the contract a builder was entitled to anything which might be taken out of a house in the course of alterations, no matter what the value of the material might be. His Honour, in giving judgment for plaintiff on the claim and counterclaim, said that no conclusive evidence had been put in to show the existence of this supposed custom, while if it did exist it was a most unjustifiable one. He refused to grant leave to appeal.

Cement: False Weights in Bags.—At Greenwich Police Court last week James Gladstone, builders' merchant, was summoned by the secretary of the London Lime, Cement, Brick and Slate Merchants' Trades Protection Association for unlawfully using false measures or sacks, and for selling cement to which a false trade description as to its weight was applied. Charles Long said he was employed on December 20th by Messrs. Eastwood & Co. to go to the defendant's premises at Catford for a ton of cement. He saw defendant and asked for a ton of cement, and received eleven sacks and an invoice for a ton. He took the sacks to Messrs. Eastwood's Well Hall depot. William Saunders, foreman at this depot, deposed to receiving the sacks, which he at once sealed and afterwards sent to Greenwich. Ernest Scragg, foreman at Messrs. Eastwood's Phœnix wharf, Greenwich, said he weighed the bags, which in the total were 163lbs. short. Sydney James Bolt, another carman, proved a further purchase, which Mr. Scragg said was 172lbs. short. Albert Letchford gave evidence of a third purchase, which was said to be 205lbs. short. Harry Le Marchant, managing director of Messrs Martin, Earle & Co., wholesale cement merchants, deposed that his firm supplied the defendant with cement. In the ordinary course eleven sacks to the ton would be supplied, but at the defendant's request he was supplied with twelve sacks to the ton. In cross-examination, witness admitted that many of the defendant's orders were eleven sacks to the ton, and he produced only three orders where twelve sacks were specified. Harold Anderson, director of the Associated Portland Cement Manufacturers, also deposed to the sale of cement to the defendant in ton lots contained in twelve sacks. For the defence Mr. Davies said his client's instructions to his foreman were to supply the correct quantity, and if there was any deficiency to make it up. The defendant said he purchased the twelve sacks to the ton for the convenience of small dealers. His special instructions to his foreman were that if there were no eleven-to-the-ton bags, and anyone wanted a ton, he was to break a bag and distribute it among the eleven, so as to make up the weight. His manager informed him that he had sold eleven sacks to the ton (this being the third purchase), and witness told him to go off at once and rectify his mistake. He had been in business for many years, and this was the first complaint he had received. Any shortness of weight was without his knowledge. Mr. Baggallay, the magistrate, said there was clearly a false trade description, and the defendant had not proved that he was unaware of what was going on. He fined the defendant £10 and £10 10s. costs.

CLERKS OF WORKS' ASSOCIATION.

The twentieth annual dinner of the Clerks of Works' Association was held in the King's Hall of the Holborn Restaurant last Monday week, February 16th, under the chairmanship of Mr. Christopher Harston, J.P., F.R.I.B.A. There was a very large attendance of members and visitors, over 300, making a record in the history of these gatherings, completely filling the hall. An excellent menu was afforded, and the following artists entertained the company:—Miss Florence Ogilvey, Miss Carrie Tubb, and Messrs. Will Edwards, Park Hunter, George Schneider, Ernest Pike and Thomas Lynes. Mr. Harston having given the loyal toasts from the chair, Mr. F. Walker proposed the toast of the "Architects and Surveyors." He said he hoped soon to see established a Chair of Architecture at the Universities of Oxford and Cambridge. We were always praising the work and the men of the past, and not sufficiently the men in our midst, until it became too late. There was, however, a hard-worked and often scantily paid body of men known as clerks of works who, of all men, were in a position to know the vast amount of strenuous thought absorbed in every well-arranged scheme before even the first brick could be laid. Mr. Edwin T. Hall, F.R.I.B.A., and Mr. W. T. Farthing, F.S.I., responded. Mr. John Pain in proposing the toast of "The Worshipful Company of Carpenters" referred to the many favours the Association had received at their hands, accommodation for their meetings being provided at Carpenters' Hall and the use of the library granted to the members. Mr. J. Hutton Freeman, the new clerk to the Company, in response thought the Carpenters' Company equally owed a debt of gratitude to the Association for the help they gave in the examinations. He called attention to the certificates granted by the Company to clerks of works who successfully passed a special examination; these he thought acted as a sort of hall-mark of their knowledge. The Chairman in proposing the toast of "The Clerks of Works Association," said he was glad to hear of the incorporation of the Association so as to allow it to extend its scope. Clerks of works were necessarily separated and scattered all over the country, and they occupied very responsible positions, and a society such as this had a great influence in maintaining integrity among its members. He was not an advocate of the principle of sending young men from the office to act as clerks of works. It would be a good thing for the young men, no doubt, but not for the client. Mr. James Petrie, president, in response, said it was proposed to form a benevolent fund in connection with the Association. Mr. J. T. Rees, vice-president, proposed "The Press and Visitors," which was replied to by Mr. E. W. Harvey Piper and Mr. John Hill. Mr. John Davies concluded the toasts with "The Chairman."

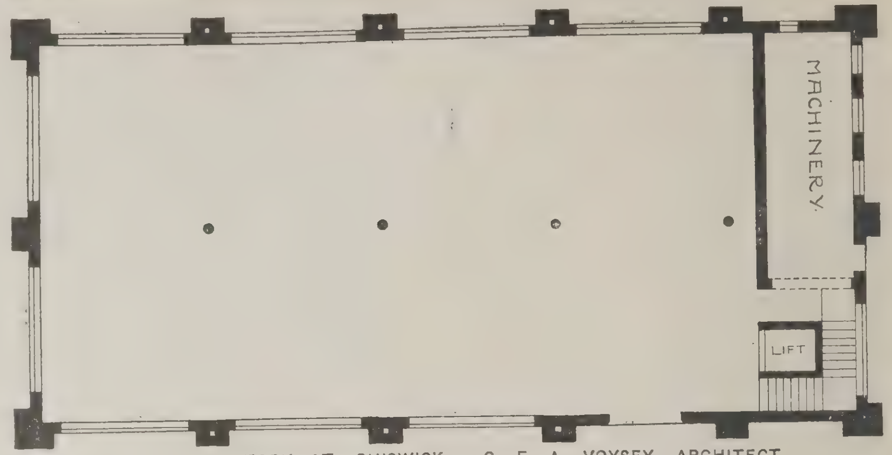
Space in Bakehouses.—The Home Office has addressed a letter to the National Association of Master Bakers and Confectioners asking its opinion on a proposal, which is supported by the Society of Medical Officers of Health, that the Secretary of State should make an order increasing the standard of cubic space per worker in bakehouses from the 250 cub. ft. at present prescribed to a minimum of 500 cub. ft. The reasons urged on behalf of this proposal are the laborious work carried on in bakehouses, the high temperature maintained and the fact that little ventilation takes place. To these may be added the general use of gaslight in bakehouses, the evolution of fermentation products in baking, and the evolution of steam and the like when a batch of bread is drawn.

Bricks and Mortar.

Aphorism for the Week.

A true architect is far more likely to be a practical man than a practical man is likely to be an architect.—R. NORMAN SHAW.

Our Plates. THE architect of the factory at Chiswick for Messrs. A. Sanderson & Sons, Turnham Green, Chiswick, is Mr. C. F. A. Voysey, of 23, York Place, W. This factory has been built for block printing. It is faced with Messrs. Broad & Son's white-glazed bricks, with Staffordshire blue bricks as black as they could be got for the 6ft. plinth, strings and window arches, sills and jambs. The coping is in Portland stone. The piers carry the floors and the roof, and in addition act as ventilating shafts. The roof, having to be half glass and half slate, is carefully concealed from view. The general contractors were Messrs. Prestige & Co., the metalwork being carried out by Messrs. Lindsay, Neal & Co., and the glazing by Messrs. Pennycook & Co. The cost of the whole work was under £10,000.—The Old Custom House, Sunderland, is situated in Silver Street, adjoining the new municipal model dwellings in the "hat case area" district. The house was originally built by Mr. Edward Brown, in 1727, as a private residence, with several dwelling-houses adjoining intended for the residence of the captains of his ships and other persons in his employ. The mansion-house at that period was surrounded with gardens, and commanded an extensive view of the sea. The street was afterwards known as "Fitters Row." Fitters was the name of the agent for coal-owners: he sold the coals to shippers. After the death of the original owner, in 1730, the mansion-house was used as the Custom House for the port until the year 1837, when the present Custom House was built. It afterwards became the home of the Sunderland Boys Industrial School, which was established by members of the Society of Friends, and is yet principally supported by them. The original builder of the house was also a member of the same religious society. The house is the only one left of the once famous row of Fitters' houses in Sunderland. The treads of the staircase, which is still in good condition, are solid and are made of oak.—The caretaker's lodge at Wells Road Board School, Bristol, was erected in connection with large Board schools recently designed by Mr. H. Dare Bryan, F.R.I.B.A. It is perfectly simple and yet conveys the impression that its use is of semi-official character.—Mr. M. H. Baillie Scott's drawing shows a proposed addition to a house which was recently built from his designs at Crowborough.



PLAN OF FACTORY AT CHISWICK. C. F. A. VOYSEY, ARCHITECT.

Exhibition Juries. THE methods for building up the juries of the St. Louis Universal Exhibition, 1904, have just been settled. In general plan the arrangements follow those drawn up by the French authorities in 1900, although, in several particulars, it has been found necessary to adapt the French rules to what may be defined as the "American idea," and also to the special character of the St. Louis Exhibition. The total number of jurors in the International Jury of Awards will be 2 per cent. of the total number of exhibitors, each nation with fifty or more exhibitors being entitled to representation on the jury. Of this selected body of International jurors three graded juries will be constituted, viz., group juries, department juries and a superior jury. One hundred points will be the highest collective marking and will represent perfection, while the awards, four in number, will be allotted as follows:—Exhibits receiving 60 to 74 marks inclusive, bronze medal; 75 to 84, silver medal; 85 to 94, gold medal; 95 to 100, grand prize.

Ancient Grecian Architecture. THE annual meeting of the Grecian Archæological Society was held at Athens last week. M. Kavvadias gave an interesting summary of its work during the last twelve months. Outside Greece it has made substantial progress with the excavation of the famous temple of Hera, at Samos, which Herodotus declared to be the "largest of all the temples which he had seen," and which is nearly double the size of the Parthenon. Within the Greek kingdom the restoration of the Lion of Chæronea and the reconstruction of the celebrated temple at Bassæ have been begun. Colonel Leake prophesied nearly a century ago that Greece, if free, could easily restore the latter building out of the fragments lying around it. The strengthening of the Parthenon, the restoration of the Erechtheion, the repairs to the wall of the Stoa of Attalos, and the building of museums at Chalkis, Nauplia, Sautorin and Mykonos complete the work of a very active year. The excavation of the ancient market-place will very shortly be begun, as the compensation due to the owners of property on its site is found to be smaller than was expected.

A Bridge of the Future. IT is now stated that there seems a real probability of the proposed bridge across Sydney Harbour being at last constructed. When it is many politicians will miss it. For forty years the North Shore Bridge has been used to win votes on the northern side of the harbour. In 1885, when Sir George Dibbs became Premier, he went to North Shore for re-election, and he was opposed by Sir Harry Parkes, whose chances were thought hopeless, in view of his opponent's popularity. People had grown tired of hearing about the bridge question, and it had been dropped for some time. But Parkes brought it up at the hustings when he was nominated, described what it would be like, and then recited:—

> "'In that straight path a thousand
> May cross as soon as three;
> Now who will stand at my right hand,
> And build the bridge with me?'
> "Out spake the bold electors—
> 'Four thousand strong are we;
> We'll all abide on every side,
> And build the bridge with thee.'"

Parkes got in, and became Premier again, but the bridge is not built yet!

Newland Church. THE old parish church of Newland, Hull, has been reopened, with enlarged and improved accommodation. The opening of the church completes a scheme which has taken many years to carry out. Originally the church was an uninteresting oblong building. The first portion of the work, carried out in 1893, consisted of the erection of a chancel and aisle, the latter being used as an organ-chamber and vestries, and also substituting traceried windows in the south aisle for the plain lancet windows of the original church. From time to time additions were made to the chancel by panelling the walls in oak and the erection of a fine carved oak reredos, and the provision of a stained-glass east window. The work dedicated embraced the removal of the gallery and west wall, and extending the church westward by providing porches and a baptistery. A new and spacious north aisle has also been erected. At the end of this aisle an arch has been opened, and here an oak screen has been erected to the memory of Mr. and Mrs. Henry Moor. The work has been carried out according to the designs of Messrs. Brodrick, Lowther & Walker architects, of Hull, at a cost of about £2,500,

Terra-Cotta. MR. CHARLES GREEN, the Master of the Sheffield Art-Crafts Guild, read a paper on "Terra-cotta" before the members last week. He said it was prehistoric in its origin, and in some cases formed the only connecting link with the past. The composition of the burnt bricks of the ancients was practically identical with that of the terra-cotta of to-day, but the term now was used to refer to artistic work moulded in the plastic state. There was no material which presented such advantages to the sculptor, and modern architects were using it in building. Sheffield possessed a few specimens of the art. The sign of the Angel Inn was done by Charles Rossi, an R.A. born in Sheffield, from clay taken from Attercliffe Common. Other examples of terra-cotta work were to be found at the Channing Hall and the School of Art. The pediment and medallions on the Theatre Royal were done by a poor travelling artist. Godfrey Sykes, a Sheffield man, was a widel known worker in terra-cotta; the Weston Park gates were executed by him, as also wa the column which represented the life of man given to the town by the South Kensington authorites as a memorial of Sykes Terra-cotta frequently had proved mor durable than stone in resisting the effect of time and weather. The lecture wa illustrated by slides, some lent by Messrs Doulton & Co.

To restore the Town Church of St Andrews £23,500 is being appealed fo Sketch plans of the proposed restoration have been prepared by Mr. P. Macgrego Chalmers, I.A. The main idea is to preserv the fine old tower and all that remains c the mediæval church, and to rebuild th remainder upon the original plan, so far a it can be ascertained. The galleries will b removed; the side aisles will be reduced t their original height; and the old clearstor will be reproduced on pillars and arche occupying their ancient places. The wal will be of stone throughout, and the greate part of the seats will be of oak.

Coming Events.

Wednesday Feb. 25.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. G. B. Aitken, F.S.A., on "Architecture and the Age," 7.30 p.m.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. W. L. Trant Brown on "Valuations," 7.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. Daniel Macfie on "Artificial Lighting in the Nineteenth Century," 8 p.m.

Thursday, Feb. 26.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Technical Demonstration on Limes, Gypsum, Lathing, Plastering and Scagliola, at Messrs. George Rome & Co., 3 Lombard Street, Westland Row, Dublin, at 4 p.m.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. Frederick Musto, A.R.I.B.A., on "Street Improvements in Leeds and elsewhere," 6.30 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

IMPERIAL INSTITUTE.—Exhibition of Irish Building Stones and Minerals opens.

INSTITUTION OF ELECTRICAL ENGINEERS.—General Meeting at Institution of Civil Engineers at 8 p.m.

Friday, Feb. 27.

INSTITUTION OF CIVIL ENGINEERS (Students' Meeting).—Mr. E. Falk on "The Relative Advantages of Single Screws, Twin Screws and Triple Screws, for Marine Propulsions," 8 p.m.

Saturday, Feb. 28.

BUILDERS' FOREMEN'S ASSOCIATION.—Mr. A S. E. Ackerman, A.M.I.C.E. M.S.I, on "Some Notes on Sanitary Arrangements and Testing."

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to the Usher Institute of Public Health.

Monday, March. 2.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Business meeting: Election of Royal Gold Medallist.

SURVEYORS' INSTITUTION.—Junior meeting at 7 p.m.

SOCIETY OF ENGINEERS.—Meeting at 7.30 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. Sidney K. Greenslade, A.R.I.B.A., on "Libraries in America."

Tuesday, March 3.

GLASGOW ARCHITECTURAL ASSOCIATION.—Mr. Alexander Wright on "Italian Architecture."

ARCHITECTURAL ASSOCIATION OF IRELAND.—Meeting at 7.45 p.m.

Wednesday, March 4.

EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Section).—Mr. James Gillespie on "Some Notes on Towers and Steeples," 8 p.m.

SURVEYORS' AND AUCTIONEERS' CLERKS' PROVIDENT ASSOCIATION.—General Meeting at Auction Mart at 7 p.m.

INSTITUTE OF SANITARY ENGINEERS, LTD.—Special Council meeting at 7 p.m.

Thursday, March 5.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Technical Demonstration of Home Drainage, Plumbing, Sanitary Fittings, Heating and Hot Water, Water Mains and Service Pipes, Pumps and Hydraulic Rams, at Mr. William Baird's, 12 Lower Abbey Street, Dublin, 4 p.m.

CHEMICAL SOCIETY.—Meeting at 8 p.m.

Friday, March 6.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. James C. Walker on "Planning and Construction of Burgh Buildings," 8 p.m.

ARCHITECTURAL ASSOCIATION.—Messrs. H B. Creswell and A. W. S. Cross on "Competitions," 7.30 p.m.

JUNIOR INSTITUTION OF ENGINEERS.—Mr. W. T. George on "Practical Notes on the Use and Maintenance of Electric Motors for Factory Purposes," 8 p.m.

Saturday, March 7.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE SCIENTIFIC SOCIETY.—Mr. Joseph Menmuir on "Low-Pressure Switch Gear," 7.30 p.m.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Meeting at Carpenters' Hall at 6 p.m.

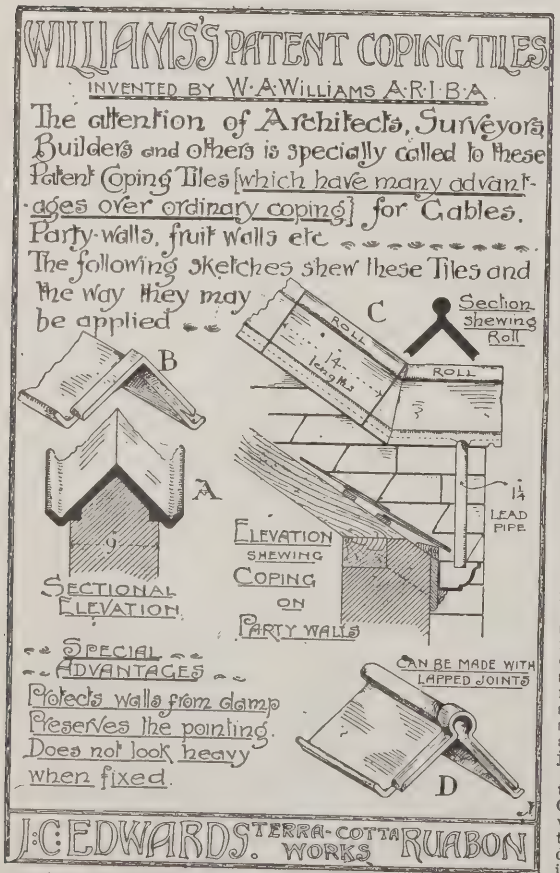
IMPROVED COPING TILE

(PATENTED)

For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES.
INVENTED BY W·A·WILLIAMS A·R·I·B·A.
The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles [which have many advantages over ordinary coping] for Gables, Party-walls, fruit walls etc.
The following sketches shew these Tiles and the way they may be applied.
SPECIAL ADVANTAGES
Protects walls from damp
Preserves the pointing.
Does not look heavy when fixed.
J. C. EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter, or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage. No other ordinary Coping answers the same purpose.

TILES. TILES. TILES.

WALL TILES.

WALL DECORATION.

FLOORS.—Sole Manufacturers of "Etruria - Hydraulic," "Ironstone - Adamant;" also Makers of Encaustic and Tesselated Tiles and Ceramic-Mosaic.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

March 4, 1903. Vol. 17, No. 421. 9, East Harding Street, E.C.

Cupboards. WE WERE much pleased to read the King's letter to the chairman of the London County Council in regard to the Millbank working-class dwellings. The Council's architects have done good work here, and we may be sure that Lord Knollys's letter was more than a formal recognition of the fact; more especially as his Majesty was an active member of the Royal Commission on the Housing of the Working Classes. But the point in the King's letter is, that a larger number of cupboards should be provided in dwellings of this class. His Majesty has there touched on a most important, though seemingly trifling, matter. While architects are minutely attentive to the administrative requirements of those who are engaged in public offices and other buildings, they very often forget that it is equally essential to consider a house from a woman's point of view. If they did they would provide a great many more cupboards. And these cupboards should not be a mere boarding-in of awkward corners—tiny boxes of little use—but well-arranged square-sided get-at-able cupboards capable of holding the innumerable little articles of the housewife. Such provision is particularly needed in working-class dwellings, and we trust that the King's letter may prove fruitful. It does not follow that all the carefully-designed plans of a tenement will be appreciated—cases are not infrequent of baths filled with the relics of the coster's barrow, and of air-gratings choked with rags—but cupboards are sure to be used, and though sometimes they might become the handy receptacle for rubbish, they would, as his Majesty says, help to prevent a litter in the rooms and so add to their tidiness.

The Advertising Architect. A CORRESPONDENT sends us some cuttings from the advertisement pages of a well-known American magazine which show the business architect at his best—or worst. "For a dime I will send one portfolio of ten plans and views of cosy homes," says one architect of St. Louis who designs artistic houses that make cosy homes; "and to show you my work will draw your own plan to scale, with pretty view of house for $1.00." Then there s a firm of architects who offer "two matchless books on house building." "Send us your ideas and $5.00," says another enterprising firm, "and we will make you a beautiful coloured sketch" (we know that sketch). "Think of it!"—yes, we think of it—"over 100 plans all costing to build the same amount, for $1.00: all practical as well as artistic." And yet we still hear that architects have no enterprise! Architecture an art, a profession or a trade? Why, here is the bed-rock of it all. Who wants a fine house, "all practical as well as artistic"? Turn up the page and there it is—the latest thing, most fashionable. There is no doubt about this being a dollar's worth of business—a good dollar's worth, with all the art thrown in: and why not? Nobody can mistake this: the mask is torn off. Architecture a trade, as plain as a pike-staff. Maybe 'tis only the incubation stage before the "combine." Yet we are glad those advertisements were American, not English.

Westminster (R.C.) Cathedral. A PARAGRAPH has been recently going the round of the newspapers to the effect that an anonymous donor has presented to Westminster Cathedral four baptismal fonts taken from churches in the neighbourhood of Venice. The statement is absurd on the face of it, as no Catholic Church, not even a cathedral, would indulge in the luxury of four baptismal fonts, one being considered sufficient for all purposes; besides, the Italian Government exercises such a control over the property of the Church as to make a transaction like this impossible. A reference to the handy little guide to Westminster Cathedral published by Messrs. Burns & Oates, price 6d., would have been sufficient to show the inaccuracy of the report. In the description of the baptistery on p. 46 we are told: "This, as will be seen from the plan, is situated right of the narthex on entering the cathedral. Herein will be placed the superb font of marble, in the Byzantine style, designed by Mr. John F. Bentley and executed in Rome. It is the munificent gift of Lady Loder, who is also one of the founders of the cathedral. In the deep niche of the baptistery will be placed a fine copy of Thorwaldsen's statue of St. John the Baptist, ordered by the late Marquis of Bute for this niche a few months before his lamented death. Lord Bute was one of the first founders of the cathedral and has left us for all time this most acceptable memento of his well-known devotion to St. John the Baptist, his own patron saint." Referring to this handbook, it will be as well in any future edition to correct an error on p. 61, where, in reference to the architect of the cathedral, it is stated that "the Society of Architects . . . have already recognised . . . his architectural genius." This is of course a mistake for the Royal Institute of British Architects, who conferred on Bentley the Royal Gold Medal, an honour he unhappily did not live to receive.

Three Bills. THE London Building Acts (Amendment) Bill and the Plumbers' Registration Bill were read a first time in the House of Commons last week. We publish in this issue the concluding part of our article dealing in detail with the former Bill, so that there is no need to enlarge on it here. We would observe, however, that while the object of the Council to secure powers over old buildings is undoubtedly a worthy one, the Bill is too drastic in its requirements; and with such widespread and powerful opposition as it receives from the City, we think it very unlikely that the measure will become law in its present form. The Plumbers' Registration Bill has, like the Architects' Registration Bill, been before Parliament for many years, though up to the present the efforts to get it through the House of Commons have not been successful. Yet it is a Bill that deserves support. Looking back on any movement which has been urged with great zeal—such, for instance, as the Gothic Revival—we may see how it went too far in parts and burnt itself out; but we do not think this will be the case with sanitary reform. The continued researches in microscopy and bacteriology show more and more clearly how essential it is that sanitation should be most thoroughly carried out; so that the plumbing of a house should not be left to anyone who liked to call himself a plumber. Of the Architects' Registration Bill we hear nothing from a parliamentary source. The Society of Architects has restarted its crusade and, as already announced in these columns, has circularized the profession; but we may be sure the Bill will never be passed until the Royal Institute gives its support. That support, formerly so frigidly withheld, appears now to be somewhat more feasible; and within the next few years we should not be surprised to see a Bill for architects' registration introduced by the Institute. Till then, the old arguments, pro and con, may be worn still more threadbare.

ST. MARK'S CAMPANILE.

ITS REBUILDING.

No longer overshadowed, dwarfed and debased by the ultra-predominant height, clumsy dimensions and ignoble materials of the enormous mass—which, so unlike Giotto's agile and graceful conception, stood isolated in the more modern square like some defiant costermonger in a drawing-room—the noble proportions of the contiguous Royal Palace at last appear in all their natural majesty. The wonderful front elevation of the Basilica, the one defect in which was its apparent want in height, no longer impresses the beholder with a fastidious sense of its squatness, no longer strikes him as somewhat trivial, but, freed from the unavoidable comparison with the towering mass that stood before it, now shines forth in augmented astonishing splendour.

Towers in olden times were the emblems and evidences of baronial power, of the territorial jurisdiction exercised by all feudal chiefs. A tower, therefore, and an imposing one, was indispensable in Sovereign Venice. And when it stood in perfect alignment with the other buildings which formed that side of the square, and the Basilica and the present Ducal Palace, then a grim fortress, were also plain edifices of red brick, it was in perfect keeping with its surroundings, and had every reason for existing where it was and as it was. But all that is now changed.

The old brick front of the Basilica has been superseded by a priceless one of resplendent imperishable mosaics and of precious variegated marbles, many of them relics of past civilisations, of bygone creeds, while the battlements and loopholed walls of the fortress, together with the moat that rendered the approach to them difficult, have all disappeared and been replaced by that ideal front in which Ruskin rejoiced, a most graceful reminiscence of pure Hindu, as the profane may see by examining the illustrations in Rousselet's magnificent work on India, executed by order of King Edward when Prince of Wales, on the occasion of his visit to that empire.

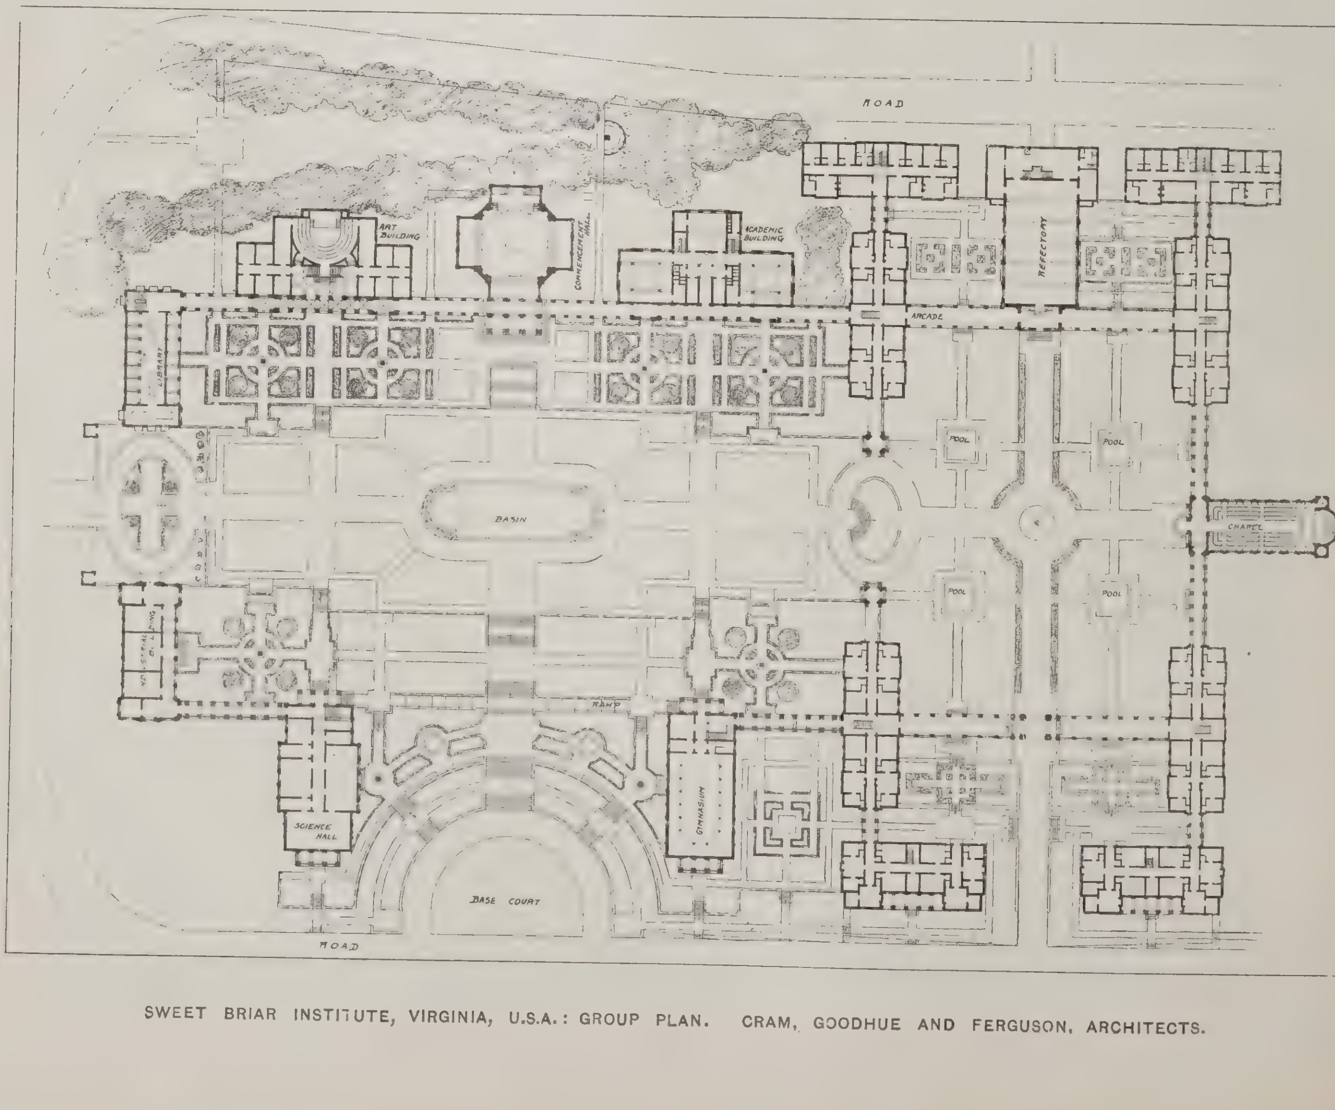
The view of those superb arcades now fortuitously opened from the Square after being long but hopelessly desired by many, adds a new æsthetic element of inestimable value to the general prospect, perfects an exquisite symphony of form and colour, and completes such a splendid comparative exposition of the fruits of the versatility and refinement of man's decorative architectural genius as is nowhere else to be seen.

And yet there are certain one-eyed fanatics, with minds fashioned in the Megatherium epoch, who would again mar this delightful prospect, this unique assemblage of elements so dissimilar and yet so harmonious, by the introduction, "where it was and as it was," of a fac-simile of that huge decrepit mass of brick which, oppressed and overcome by a mortifying sense of its own pitiable false position, of its utter incongruity amid its more modern surroundings, quietly and conscientiously collapsed in July last.

No one can have a more genuine and profound admiration and veneration than I for ancient monuments which silently but continually and majestically proclaim the sorrows and the glories of the great past in which they existed. But such monuments must be genuine, not counterfeits. . . .

No. If we are to have a new tower, let it be original. Let it symbolise the glory of young Italy. Let it proclaim the deeds accomplished by her in the history-making epoch in which it was built. Let it speak of the bright, hopeful, useful, progressive, aspiring Venice of to-day. In order to do so it must be characteristic, not of Gothic times, but of our own, lofty but not heavy; graceful, in as much decorative harmony as possible with the Basilica, and therefore, thanks to the united efforts of "Protos" and "Masters of Mosaic," joyously beautiful, bearing on its front, with conscious pride, the new, grand, peace- and prosperity-giving programme, the triumphant legend, "United Italy and Victor Emmanuel."

A final observation. The papers recently informed us that the delay in disencumbering the Square of the old stump is due to the fact that the material resulting from its final demolition is to be used in filling up the trenches which are being opened round its base in order to make a thorough examination of the subsoil; but they did not tell us what is intended to be done with the "deblai" from them. This omission reminds one of the gentleman who, having called his man, said, "John, dig a hole in the garden and bury all this rubbish!" "Yes, sir," said John, and away he went to execute the order. A few hours afterwards he returned to ask his master what he was to do with all the earth that had come out of the hole to make way for the rubbish. "Fool!" cried the impatient boss, "don't bother me; dig a hole big enough to put earth and rubbish and all in!" How John solved the problem history does not inform us; but we presume that clever Commendatore Boni knows the secret, and that unimpeded vision of the entire area of the matchless Square, and of the edifices surrounding it, will be available by the time the Fifth Biennial Exhibition of International Art is about to close.—(Extracts of a letter from a Venice correspondent of the "Daily Graphic.")



SWEET BRIAR INSTITUTE, VIRGINIA, U.S.A.: GROUP PLAN. CRAM, GOODHUE AND FERGUSON, ARCHITECTS.

SWEET BRIAR INSTITUTE, VIRGINIA.

WE reproduce this week several drawings of the Sweet Briar Institute which is now being erected in Virginia to shelter one of the largest schools for young ladies in the south of the United States. From the plan on the opposite page it will be seen that the buildings and grounds have been laid out in a masterly style. It will be noted that there is an arcaded rectangle enclosing the garden, around which the buildings are grouped. On either side of the fore-court to the left are the library and the industrial building; then, on what is presumably the north side, are successively the art building, commencement hall, academic building, dormitory, refectory, and dormitory. To the right, the chapel occupies the centre of one side, with two dormitories on the south side. Then come the gymnasium and science hall, admirably placed on either side of the base court. The plan is very skilfully treated, as one would expect of such well-known architects as Messrs. Cram, Goodhue & Ferguson, and we are glad to be able to lay it before our readers: for this, however, we are indebted to the "American Architect," from which we reproduce the accompanying illustrations and the bird's-eye view in the centre-plates.

SWEET BRIAR INSTITUTE, VIRGINIA: THE RAMP.

STAINED GLASS OF THE FUTURE.

By SILVESTER SPARROW.

(Concluded from p. 23, No. 420.)

HITHERTO windows have been a hopeless jumble of colours, everyone for itself and the Devil take the window. People seem to have started colouring a design at one end without having had the least idea what the other end would be like. Not that there is any restriction on colours so long as they are subordinated to the key colour. Indeed, let us have as much variety as possible, so long as the unity and harmony of the whole are not impaired. This variety will lead you into the most subtle effects which will always add charm to a work, and charm is a very essential quality. Strength and subtlety should be the character of the colour scheme; strength, of course, being derived from a bold treatment of the primaries. The primaries must be as rich and full as possible, and in bold masses, if your window is to have the necessary vigour and grip. So-called æsthetic colouring is unpardonable weakness in a stained-glass window.

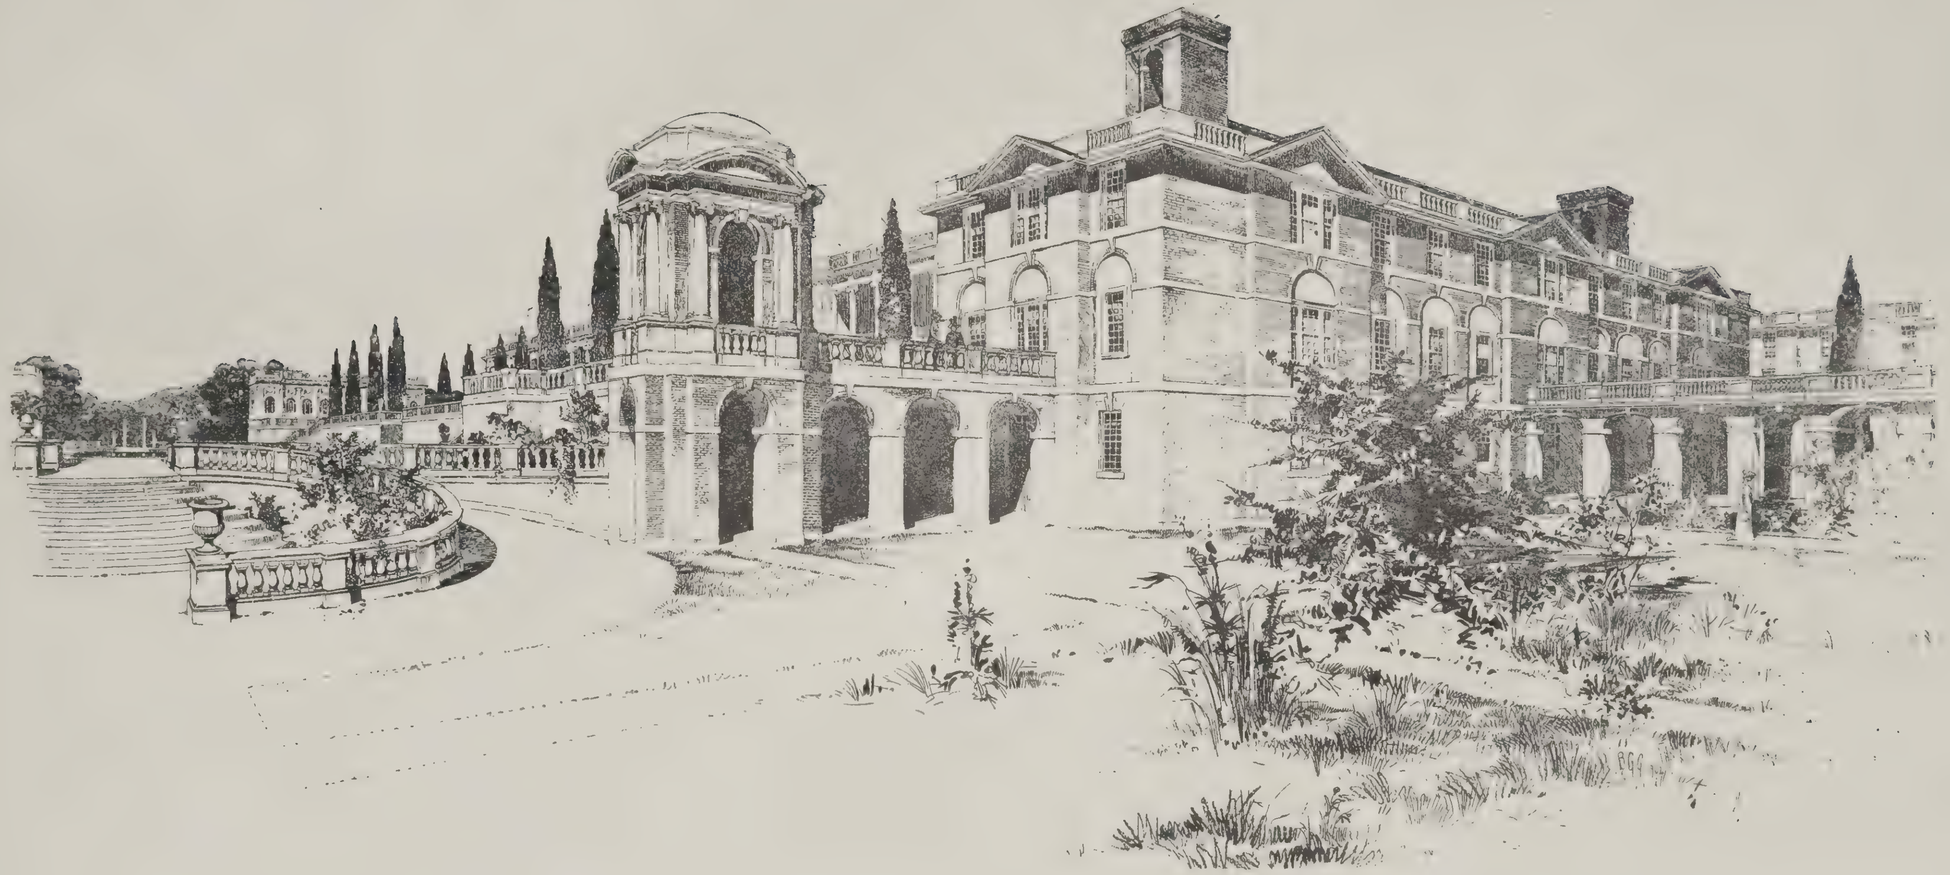
With regard to the treatment of a light window, that end is not to be attained by filling the window with light colours of the same value. That simply results in a washy window, which looks as if all the colour had been bleached out of it. No; use as much "tint" as you like, but there must be some rich colour to show that it is intentionally a light window. The same remark applies to an ornamental window in tints. There should be a little rich colour to give it grip, and a little pure white by which we may define the strength of the tint. Naturalistic colouring is not essential. Indeed, the most beautiful and glassy effects result from the unexpected. But it must have the appearance of inevitability; one must feel that to replace it with anything else would result in weakness—"and her hair shall be of what colour it please the glass-stainer." The traditional and symbolical colour of the draperies of Our Lord, the Blessed Virgin, the Apostles and others, together with their types, must be preserved (the colour scheme must be adapted to them and not the reverse); so that one may see at a glance who is being represented, or, should I say, one ought to be able to see. The church window is primarily to appeal to the eye of Faith, and one must not assume that the eye of Faith is practically non-existent, even though one have to explain to many a learned pastor (that is, shepherd) what would have been perfectly clear to the flock (that is, the sheep) of the Middle or so-called Dark Ages. This leads me to say that the symbolical is to be preferred to a literal treatment. At the same time, the symbolism is not to be a mechanical repetition of old forms, but a vivid personal insight into the heart of things. The lead scheme should be considered, as it emphasizes the rhythm of line and controls the masses of colour. Leads of various widths should be used in proportion to the size of the window. The lead is not to be considered simply for its use in holding the glass together, but as the most important factor in the design. It is the skeleton of the window. It is not unusual for firms to employ outside people to make designs who have no practical knowledge whatever, but who can turn out an attractive design or a pretty piece of colour calculated to deceive the unwary. These designs are to be known by the utter absence of any lead scheme, of the use of which the designer is profoundly ignorant. The result is that the window, usually carried out in the commonest glass, is not a bit like the design. There is one fatal error that must be avoided in putting in the lead lines. I allude to that pernicious practice of putting in curved lead lines when a round object like an arm, or a rounded fold of drapery, has to be cut on account of its length, or to obtain variety of colour. In the case of an arm the curved leads look like bracelets, and in long straight drapery folds the curved lead lines used in alternate folds give the drapery the appearance of corrugated iron. One must never forget that a window is a plane surface, and that round objects must be contradicted by straight leads. Before the cartoon can be made, sizes and templates of the window must be taken. The height from point to sill and the width, with laths. The templates are the shapes of the heads of lights from the spring line and of the tracery, cut out of brown paper. These will be sight size, to which about ⅜in. must be added all round to go into the groove. Is it necessary to say that a cartoon should be a fresh inspiration for every window? I am afraid it is, as some firms have no objection to using a cartoon a dozen times over. It

SWEET BRIAR INSTITUTE, VIRGINIA: THE LIBRARY FROM THE UPPER TERRACE.

would not be a bad plan for architects to insist on seeing the cartoons for every window they order. The cartoon should be made in sepia, as more nearly approaching the tracing and painting of the window, with the leads in black, and their proper widths. It should have a bold significant outline, even for the features, with a little shading, and not washy lines simply as a guide for the painter. The outline is a characteristic of stained-glass of any virile sort. The cutline from which the glass is cut and afterwards leaded on, must now be made from the cartoon. The cartoon is laid on a bench and semi-transparent ammunition paper laid over it. One then traces over the centre of the lead line with pencil, afterwards going over this with a brush in black ink. This gives one the heart of the lead—the skeleton of the window. Nearly every piece is now cut in sheet glass, to be used first as a "pounce" and afterwards to be painted on and fired. The exceptions are those pieces of "tint" or light colour that one can see the lines of the cutline through, and consequently can be cut from the cutline, and they will also be painted on. The method of using the "pounce" is to hold a sheet of coloured glass, which is generally varied in tone, up to the light, move the "pounce" over it until the exact place that you want cutting out has been found, then mark round it with a piece of French chalk. Hand this over to the cutter, who breathes on it and pounces round the shape with a pounce bag containing powdered whiting. Still holding the "pounce" firmly, he marks round it with a pointed piece of hard wood, and removing it its shape is found outlined on the coloured glass. The other use to which the sheet-glass is put, is to paint on it instead of the coloured glass. It is a rule that the better the glass, the less it will stand the fire. besides the general loss of brilliance, all streaks or other variations have a tendency to go darker. Gold ruby is an impossible colour to fire; besides the aforesaid loss it actually changes colour, becoming a hideous pink or magenta. Venetian opal, too, is an impossibility. No glass improves by going into the kiln, but sheet-glass suffers least, as it is harder than coloured glass generally is. In glazing, the coloured glass is kept in front of the painted piece, so that, besides preserving the paint from the action of the atmosphere, it has something of the effect of varnish on a picture, adding to the transparency of the shadows. We have now reached a most important section of the work: the selection of the glass. This I hold to be the artist's most individual task, which he cannot delegate to anyone. The usual way in firms is to have the different colours in numbered racks; then the master numbers the cutline, and the cutter goes to the corresponding rack, and chooses any sheet and part of a sheet he likes. What idea can the cutter have of the relation of each piece to the whole, or how one colour will affect another—a matter of the utmost difficulty in stained-glass? Colours and tones affect each other enormously, and demand the greatest care and experience. In selecting, every lead must be taken advantage of to vary the adjoining pieces. Of course the master makes alterations when the glass is on the easel being painted, or even after it is leaded up. One hears of quite heroic attempts in that direction—of one master who had a figure cut over three or four times before *he* was satisfied. It was very good of him to take so much trouble, but what bungling not to know what he wanted at first. How can that warmed-up colouring give one the exquisite thrill of the tingling grip of the artist's hand, where every piece, however varied or unexpected, seems inevitable? We will urge this reform in the interests of the masters themselves. We will tell them that in denying themselves the pleasure of selecting every piece of glass they miss the highest rapture in the production of a stained-glass window, even at the cost of a smaller output and consequent diminution of profits. We must save them from themselves. That pernicious method also favours a great fallacy—that the light and dark of a sheet of coloured glass should be utilized to give the light and shade of a drapery. *This* is to make a window pictorial, and leads to general flabbiness of colour. Now, the principle of colour in stained glass is contrast, one piece throwing up another. Only by this means can one display the jewel-like character of the material. This principle of contrast applies not only to the light and dark of a colour, but to a mixture of contrasting colours or tints, enhancing the beauty of one. Take a yellow drapery, for instance; there should be a dominant note of rich, pure yellow; then the colour branches out on each side, as it were—on the one side to the greens, and on the other to the reds. These are not to be gradual changes, but sudden contrasts—a greenish yellow against a reddish yellow, for instance—and there must be contrast in values as well. There is no end to the variety that may be imported into a colour so long as the impression of the one colour that has given the keynote remains. This method, besides preserving the essential glassiness of the material, gives a grip and subtlety to the colour which can never be attained by the light and dark of one colour. For the necessary breadth of effect large masses of colour with the utmost variety within each are essential. White draperies should be treated in the same way, a mixture of warm and cold tints, the warm or cold predominating as is found necessary. For flesh I use various tints, in accordance with the character represented or the colour or tone required. There is absolutely no restriction with regard to the colour of flesh (which, of course, must be in the glass and not painted on) so long as it harmonizes with the scheme of colour. Another very important point to be considered while selecting, and which has never hitherto been thought of, is that of *timbre*. That is to say, brilliant objects should be cut out of brilliant glass, dull and solid objects out of duller, more opaque glass, that would suggest solidity without having recourse to paint, so that even the deepest tones of a window may preserve their translucency. The various materials must be regarded as the instruments of the orchestra, each of which has its individual tone colour, or *timbre*: thus there is the brilliant sharp colour that would bring out a melody like the oboe; then the more mellow but still rich colour that would suggest the violins; then the material of such tone and texture, suitable for background purposes, that would suggest the lower strings and drums; again, a rich Early English gold ruby that would suggest the thrilling tones of the trumpet. All these should be welded together, in like manner, to produce the effect of a rich, mellow and powerful symphony.

The glass is cut with a diamond or a hard steel revolving wheel, assisted with pliers to groze or trim the glass to shape. Glass varies considerably with regard to the ease or difficulty with which it may be cut; but it is a rule that the better the glass the more difficult it is to cut. Think of cutting glass half an inch or more thick to a shape: in such cases even pincers have to be brought into use. I believe one reason why Powell's glass is not more used is that it is not so much annealed as other makes of "Antique." It is consequently more brittle, and can be cut with less certainty. Thus, to the greater cost of the best material must be added the greater cost of cutting and the waste in broken pieces; to which add the cutting of sheet and the extra pieces of colour for plating.

We have now reached the painting stage. The first step is to trace the outlines of flesh and drapery, of course, in a vitreous colour (namely, oxide of iron), ground in water, and fattened or made workable with treacle. Lay the cartoon on the bench, and you will be able to see the lines of it through the flesh tints, the light colours and the sheet-glass which you are going to paint on. When traced the glass is given a comparatively light or tacking fire. We now require a large piece of plate-glass, to be used as an easel glass, to which the glass that has to be painted is affixed with a mixture of beeswax and resin, made hot. The coloured glass may also be added, and as this is the first time we have seen all the colour together alterations can be made in it at this stage, if necessary. The colours used for painting are of an umber or earthern sort, though the oxide of iron can be added to give body. It must be remembered that the colours of the window are in the glass, and that the colours for painting are simply different degrees of warm and cold shade tints. A window is usually painted in one colour throughout, but that need not necessarily be so. The tone of colour can be adapted to different objects. For instance, a cold white can be painted in a cooler tone, and in some cases a pure black can be used. The colour, which is again prepared in water, but with gum as the medium, is laid all over the glass in a flat matt, which, while moist, is stippled with a tool called a badger. This stippling gives a granulated surface which helps the



SWEET BRIAR INSTITUTE, VIRGINIA, U.S.A.: THE GREAT COURT FROM THE RESIDENTIAL QUADRANGLE. CRAM, GOODHUE AND FERGUSON, ARCHITECTS.

texture wonderfully. When dry, the colour is gently loosened with the finger where the lights should come, and dusted off with a soft brush. As much as possible should be done with the finger: it gives more character and better texture. This process of modelling the lights is continued with hog-hair brushes and a quill to take out the high lights; the flat tone should be left for the half-tones and shadows. When fired and stuck up again, the shadows are strengthened with oil colour; the same colour prepared with turpentine, and fat oil of turps as the medium. Especially is this necessary in the flesh, to give character and expression. The dry surface of the glass is first washed over with oil of tar to let the colour flow freely. It is not essential that every piece of glass should be painted. On the contrary, if there is sufficient tone in the glass it is better not to paint, but to let the varied markings and tone of the glass speak for themselves. The shadows will then possess more translucency than if painted. Light glass heavily painted is much more obstructive to light than richly-coloured glass but slightly painted. I cannot leave the subject of painting without alluding to a kind of painting that is no painting. I mean "backing," as it is called. This is to lay a matt of colour on the back of the glass and then partially remove it, for no other purpose than to make the glass look dirty and old—to give it, in fact, that tone which the glass itself lacks. From the assiduous way in which some firms plaster the back of their windows with colour, anyone would think that the chief attraction of the old glass was derived from the accumulated dust of ages.

The parts that require it are now stained. Although this is called stained glass, and we used to be called glass-stainers (we are all artists in stained glass now), there is only one stain—a preparation of pure silver, which stains the whites yellow. It is mixed with yellow lake to reduce its strength; and this, being a vegetable colour, burns away.

When fired again, the glass is now ready to be put together by the glazier. As already remarked, it has been usual to regard the lead as simply a means of holding the glass together; consequently, to employ an insignificant lead throughout. But if we regard the lead as an important factor in the design, we must use leads of various widths and of a bolder character. The proportions of the lead must be adapted to the size of the window and its distance from the spectator. That must be a very small window where ½in. is too large for the principal lead. In large windows a ¾in. may be the principal lead; and if the window is going a great height, 1in. or more will not be too much. There must be no idea of shuffling the lead out of sight. To hide the lead and use as little of it as possible is a characteristic of the pictorial window. A window can hardly be described as pictorial where the lead is a prominent feature. Where leads of different widths are used it is necessary to mark the outline with different coloured chalks—say a blue for the ¾in. lead, a red for the ½in., while the black ink remains for the ⅜in. lead. The leading recalls a danger to be avoided in designing—not to make every piece of glass of so near a size that at the proper distance one seems to see the glass through a wire trellising. This is a danger the mosaic dispensers are apt to fall into. The leading of the double glass, and of the thick and varied pieces, offers difficulties. Leading becomes an art. One has to use a very broad-hearted lead, but sometimes that is not sufficient: in some cases one has to make a still broader heart by cutting the leaf off two calms of lead, and soldering the two hearts together, or by paring the leaf away to let the glass into the heart and then soldering a fresh leaf over it. Thus you see another process that is considerably extended by our determination to use the best material. The lead is then soldered at the joints, and the panel is handed over to the cementer. It would be more correct to say the puttier. Whereas in ordinary work of single glass the leads are filled with cement (a thick paint which ought to be composed of whiting, linseed oil, white or red lead, dryers, and lampblack to make it a lead colour), in this sort of work every piece of glass must be puttied on both sides. Copper ties are now soldered to the lead to twist round the bars, and the window is ready for fixing.

Now that I have reached the last stage of my discourse, that section which is to deal with the stained-glass of the future, I am confronted by the hateful task of having to say something about my own work. It is unfortunately necessary, because I have to show that the ideas I am about to put before you are not mere impracticable theories, but the result of working in the best material. Just as Wagner, when writing his theoretic works, deduced examples from his earlier operas, (the spontaneous outcome of his artistic need, thus proving that they were not the result of any preconceived theories), so I must describe to you my first excursion into the unknown land, the land of mystery, of light and tone. The window I am about to speak of was executed some few years ago for a lady who suggested the subject, "Wotan calling up Erda," from the third act of Wagner's "Siegfried." I must confess that at that time the subject seemed an impossible one for stained-glass, and perhaps you will agree with me when I quote the stage directions. "A wild region at the foot of a rocky mountain which rises L steeply. Night. A storm rages. Lightning and thunder, which last then ceases, while for some time lightning continues to flash through the clouds. Here the Wanderer enters. He strides with resolution to the mouth of a vault-like cavern in the rocks at front, and there stands, leaning on his spear, while he directs his invocation towards the cave. A bluish light glows in the rocky chasm. Illumined by this, Erda very gradually rises from the depth. She appears covered with hoar-frost; her hair and swathings emit a glittering light." Now, the *crux* of the whole thing was the supernatural light in which Erda appears, and I must say that I was very fortunate in finding at that time some Early English, which I tempered with Powell's blue on Venetian opal, that realised the effect perfectly. To my surprise, therefore, instead of this subject being impossible in stained glass, it became clear to me that this was precisely the medium in which effects of light were possible and could best be realised. I found there were possibilities in the best material which had never been dreamt of. Besides the supernatural light and the hoar-frost on the hair and swathings of Erda, it was possible to suggest the tone of night with the glass alone; the vigorous action of Wotan, with his cloak and "beard blown by the night wind," contrasted with the mystical stillness of Erda; also the flash of red in the sky suggesting the subsiding storm. Pictorial, you will say? Not at all. A pictorial window would have been a representation of the scene as it takes place on the stage. But this is an independent conception, conceived in the terms of the material, and producing a result which could not be attained by any other medium. Let us be quite clear on this point. A stained-glass window becomes pictorial when it does such things, or in such a manner, as can be done as well or better in another medium, *e.g.*, in a picture or wall-painting. It follows from this that there is a class of subject which is peculiarly the province of stained glass; that is, the supernatural, in which mystery is the most vital element, and in producing which, effects of light—with which in stained glass we are dealing directly—are the chief factors. I will just summarise the ideas I have gained by carrying out that "impossible" subject. That the subject of a window should be supernatural and symbolical. That mystery is the highest and indispensable quality. That to produce that, effects of light and tone are the chief elements. That there must be a definite tone-colour, and keynote of colour. The tracing and painting must be bold and expressive, wherever it is needed; but, as far as possible, the glass must be left to speak for itself; and the leading must emphasize the important lines of the design. Why should stained glass alone stand still and stagnate? Change is the law of progress, no less in art than in human society. Away with the imitation that paralyses the imagination, and let us bring whole hearts to the study of the best material and the natural development of early work, when, as I imagine, there was only one kind of glass—the best the people could make. What, then, is this natural development of early work which I venture to call "The Stained-glass of the Future"? And why is our development to spring from early work, and not from fifteenth-century and later work? Because the latter was no intrinsic development of the former, but simply a repetition in a more elaborate and ornate form. It is still a window of single figures or small subjects connected with canopies; consequently it leads to an *impasse*, a *cul-de-sac;* there is no development possible on those lines, so it *must* be ignored.

And now to the development ahead of stained glass. In the first place, I should regard it as a development that in an age of commercial production we consciously choose the best material. Another very important development would be that of regarding a window as a whole—one window, one subject—and not a series of small windows, as the single figures connected by canopies suggest. It must be distinctly understood that my desire to treat a window as a whole is not due to any impatience of the shafts dividing the window into lights; but to focus the attention on one subject, instead of frittering it away on a number of single figures or small subjects. The shafts, therefore, must not be ignored, but clung to as the ivy clings to the oak. Broadly speaking, the linear design, if a window is to have its due monumental character, should be more or less perpendicular, following the lines of the shafts. Impersonal objects, such as angels' wings, trees, clouds, drapery, the lines of the landscape, may run through two or more lights, to help in binding the window together; but the human figure should very rarely extend beyond its own light. The colour design, however, should be horizontal—in strata, as it were. That is to say, the strong colours should be concentrated on the base of the window, as in a musical composition the base is the most important thing; in the middle more neutral tones can be used; and in the upper part lighter and more ethereal tones, thus carrying the subject away into boundless space. The canopy must go, since it is no longer required to divide a window into sections, and as its lightness interferes with the tone of the window. You will see from this set of designs the difficulties one has to contend with in fitting a subject that demands a centre light into a window of an even number of lights. This suggests the idea that the architect when he has a church to design might do worse than confer with the glass-stainer as to the scheme of windows, with the view, in some cases, of adapting the shape of the window and the number of lights to the exigencies of the subject. Perhaps this is a counsel of perfection, but, at any rate, you cannot go far wrong in providing us with a centre light. Most subjects from the life of Christ demand a centre light, so instead of four- and six-light windows give us three, five, and seven lights.

I feel very strongly that the architect should get out a scheme of subjects for all the windows in his church, whether there is any idea of them being carried out at once or not. The subjects would not then be such a hideous and incoherent jumble as they generally are now.

Another development would be a firmer grasp of the colour scheme, based on each window having a definite tone-colour in harmony with the subject; and a keynote focussing the colour. Its symbolism must be reconsidered and developed, so that it shall appeal to the Spirit of Reverence (if any such exists) of to-day. Its drawing must be simple, dignified and natural, without affectation of mediævalism. It will be a development to use paint with discretion, and only where it is necessary to give tone and contour. And, finally, by a bolder system of leading, show that we regard it as the main factor in the design. Do not think, therefore, that I wish to ignore all tradition, and expect stained glass to begin *de novo* from this moment. On the contrary, it is necessary to study good examples, and see what is the natural form of expression in this art, and what effects have been obtained with limited means. But surely one may study without falling into the rut of imitation; and let it not be forgotten, also, that our knowledge is increased by learning to avoid many things that have gone before. On the other hand, do not run away with the idea that stained glass is to be learnt by simply looking at old windows. Before anyone can make a cartoon for stained-glass, before anyone can know what style of drawing the painter requires, he or she must have had practice and experience in tracing and painting on glass. As I said at the beginning, "only those who have worked in the best material are qualified to speak of the possibilities lying dormant in it." Let us, then, throw ourselves with enthusiasm into the task of making the best use of the best material, so that by developing it as we develop every other phase of the art we may produce, by our works of imagination and mystery, those feelings of exaltation, of rapture and devotion, it has hitherto been the province of divine music alone to impart.

The Discussion.

Mr. Lewis F. Day, in proposing a vote of thanks to the lecturer, said he thought there was other glass to be got quite as good as Powell's and Prior's. He did not agree that white windows were bad, in view of those at Salisbury and York Minster. He gathered that Mr. Sparrow would have the glass of the future deep and rich, but we had become accustomed to light windows and insisted upon them. He was of opinion that the glass of the future would not be deeper or richer, but lighter and more brilliant. He did not agree that there was no mystery without stained glass. The mystery in great buildings such as St. Mark's, where there was mosaic work, was as great as in buildings where there was stained glass. Mr. J. D. Crace seconded the vote.

Mr. N. H. J. Westlake deprecated the practice of "plating." It was pernicious on the point of durability, as the lead of a window was the first part to decay, and then there was the probability of the falling out of one of the plates. Morever, it added to the weightiness of a window. A window of good stout glass and lead had always a tendency to cockle irregularly, and to tear itself from its copper bands, and this irregularity of weight should be obviated and not exaggerated.

Mr. E. J. Prest called attention to other makes of glass, recommending that made by Messrs. W. E. Chance, and the St. Mungo glass made by a small firm in Glasgow. Mr. F. Lishman, Mr. J. Dudley Forsyth and Mr. Henry T. Hare then spoke.

Mr. Sparrow in reply said it was essential to plate, because the demand for good material was so small that one could not get colours rich enough or in sufficient variety without it.

Correspondence.

Licences for making Valuations.

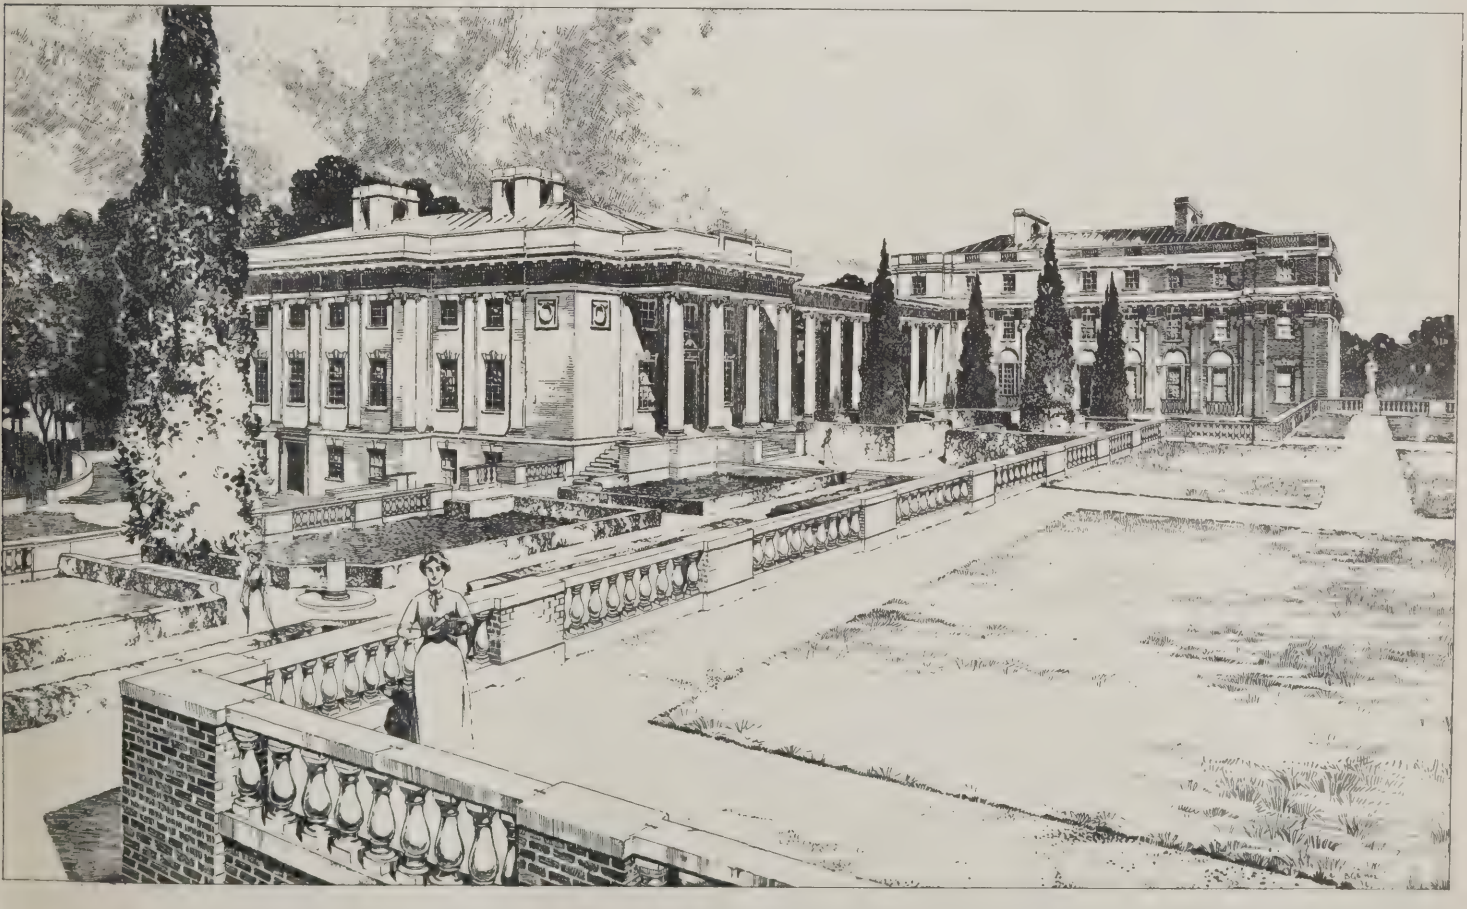
To the Editor of The Builders' Journal.

Sir,—I fail to see how Professor Adams can conclude (Builders' Journal, February 18th, p. 8) that any individual can make a valuation without being duly licensed, from the bare fact that the Stamp Act exempts valuations or appraisements made for the information of one party only. Is it not the case that when the valuation is made for the information of one party only that the Stamp Act simply exempts the *stamp duty* in the document? There is no law to my knowledge which would permit an individual to make such a valuation without being duly licensed, unless it were done gratuitously.—Yours truly,

D. FORBES SMITH, A.R.I.B.A.

With reference to the above letter I may say that, as a rule, laws are not framed to permit something to be done, but to prevent it, and an individual may do anything that is not forbidden by law. But apart from this general view, it is a question of practice, and I believe that I have correctly stated the practice among surveyors, and what it is based upon. Personally I have made many valuations during the last thirty years, but have never held a licence and have never to my knowledge met a surveyor who did hold a licence or considered one necessary when making valuations for clients. The matter has often been discussed, and there is a general impression that a Fellow of the Surveyors' Institution need not hold a licence, although, so far as I am aware, he is under the same limitations as any other surveyor or valuer; at any rate, I have not omitted to take out a licence on that account. I may say also that as an arbitrator under the London Chamber of Arbitration I have not considered it necessary to hold an appraiser's licence, although there acting as between parties.—Yours truly,

HENRY ADAMS, F.S.I.



SWEET BRIAR INSTITUTE, VIRGINIA: SCIENCE HALL AND INDUSTRIAL BUILDING. CRAM, GOODHUE AND FERGUSON ARCHITECTS.

ACETYLENE.*

By JOHN W. WOODALL, M.A., and F. WINDHAM, A.M.I.C.E.

BEFORE I begin this paper on acetylene I think it right to state that I am indebted very much to the Cantor Lectures on this subject given by Professor Vivian Lewes, and the report of the Third Congress on Acetylene held at Paris in 1900.

I propose to confine my remarks to the history and chemical composition of the very curious product of the electrical furnace to which the name of carbide of calcium is given, and from which the gas acetylene is generated by the action of water.

So long ago as 1836 Edmund Davy, in Dublin, who was then Professor of Chemistry to the Royal Dublin Society, described acetylene gas and demonstrated some of its more remarkable properties. He read a paper at the British Association the same year, and showed that when the metal potassium was made by heating a mixture of calcined tartar and charcoal in a large iron bottle a black substance was formed which was readily decomposed by water, and yielded a gas then called bicarburet of hydrogen; subsequently, as we now know, it received the name acetylene. In this paper Professor Davy pointed out the brilliancy with which this new gas burnt, and that it was admirably adapted for artificial light purposes if it could be produced at a sufficiently cheap rate.

Twenty years later, in 1857, Zust and Boettiger made some researches, but it was not until in 1859–62 that Berthelot made known its true composition and method of formation.

He showed that acetylene was formed during the decomposition of many organic substances by heat, and that ethylene, methane, alcohol and ether all yielded this gas when passed through the heated tubes, and finally demonstrated the possibility of synthetising acetylene by passing the electric current between carbon points in an atmosphere of hydrogen.

A further development has been suggested, as Professor Lewes states, which is interesting, namely, that alcohol and probably sugar might be made from acetylene.

Acetylene was first called bicarburet of hydrogen, afterwards klumene, but later acetylene has been adopted.

On analysis the gas is found to contain:—

Carbon - - - - -	92·3
Hydrogen - - - - -	7·7

which answers to the formula C_2H_2.

It has a density of 0·92 as compared with water = 1.

By the action of water on calcic carbide it has a strong and penetrating odour, but when purified from sulphuretted and phosphuretted hydrogen has a somewhat etheral smell which is less unpleasant.

It is easily soluble in water which at ordinary temperatures and pressures takes up a little more than its volume of gas.

According to Professor Lewes:—

Brine dissolves- - - -	0·05
Water ,, - - - -	1·10
Alcohol ,, - - - -	6·00
Paraffin ,, - - - -	1·50
Acetone ,, - - - -	31·0

It was thought that it would not be possible to use acetylene in ordinary gas fittings, as it forms compounds which explode with copper, but subsequent experiments have shown that except with pure copper and under circumstances which cannot occur in ordinary working, the gas fittings, if of the best material and workmanship, may safely be used.

When mixed with air it is very explosive, and detonates under certain conditions with such violence that it cannot *alone* be used for gas engines.

For further information I would beg to refer anyone who is interested in this question to the admirable Cantor Lectures I have already mentioned, which cover far more ground than can be attempted on the present occasion.

Carbide of Calcium.

It is well understood that for commercial purposes acetylene is best generated from carbide of calcium, though there are other carbides of the metals which give off gases more or less consisting of acetylene when decomposed by water.

The history of the manufacture of this substance is detailed at length both in Professor Lewes's lecture and in the Comptes Rendus of the Congress of Acetylene to which I have referred.

It was first made for commercial purposes at Spray, in North Carolina, by Mr. Wilson, and soon after at Leeds and at the great works at Foyers; also many installations in Europe, in France, in the Pyrenees, and the Rhone Valley in Germany, at Neuhausen, near Schaffhausen-on-the-Rhine, and in other places where water power is to be obtained.

The two processes used in making calcic carbide by electric power are the ingot and the tapping process.

In the ingot process the coke and lime, both of which must be very pure, and especially free from sulphur and phosphorus, are carefully mixed and ground finely. The arc is struck in the crucible and the powder is allowed to flow in and partially fill the crucible. An ingot is gradually built up from the bottom of the crucible, the carbon electrode being raised from time to time. The crucible is of metal. The essence of this method is that the coke and lime are only heated to the point of combination and are not "boiled" after being formed.

In the tapping process a fixed crucible is used, lined with carbon. The electrode is nearly as big as the crucible, and a much higher current density is required. The materials do not require to be ground fine. The carbide is heated to fusion and is tapped at short intervals.

Calcic carbide, as formed in the electric furnace, is a crystalline semi-metallic looking substance having a density of 2·2. It can be kept unaltered in dry air, but the smallest trace of moisture in the air leads to the evolution of acetylene and gives a distinct odour.

The purity of the carbide entirely depends on the purity of the materials used in its manufacture. Although great care is exercised, minute traces of sulphuretted and phosphoretted hydrogen are found. The first gives rise to a pungent odour, and the other compound would, if present in any large quantity, cause the gas to ignite when coming into the air.

There are also some other impurities in the carbide. Professor Lewes notices very small diamonds as having been observed, while portions of the crust seem to consist of a very hard combination of carbon, silicon and aluminium, commonly called carborundum, which is used in America as a substitute for emery powder and for grinding wheels, &c.

Acetylene is used to enrich the oil gas used by the railway companies, and Professor Lewes states that fully 3,000 tons of carbide were so used in Prussia in one year by the railways. It has also been found to be useful in enriching a slightly modified form of water gas.

These mixtures are stated to be free from any danger when compressed for railway use, and will no doubt be largely used in the future.

In conclusion, I would wish to quote the words of Professor Lewes that "forty lectures would not be too many to illustrate this subject, and that in time cheapened carbide will enable this valuable hydrocarbon to take its place in the foremost ranks of our illuminants."

JOHN W. WOODALL.

System of Generators.

The various systems, all of which work slightly above atmospheric pressure, 3in. to 4in. of water being about the best pressure to keep the burners free (though the Home Office regulations allow 100in. of water pressure), may be divided into three classes:—

(1) Those in which the calcium carbide and water are brought into intimate contact by a change of level of one or the other substances.

(2) Those in which the water is allowed to fall or come in contact with the carbide drop by drop.

(3) Those in which the water volume largely exceeds the volume of carbide which is allowed to fall into the water.

Class 1.—The machines under class 1 are so-called automatic, but they are mostly unsafe, from the fact that high temperatures may be reached by the carbide, which causes disintegration of the resultant gas, producing benzine, ethylene and various other tarry deposits which tend to foul the pipes and apparatus. It is possible in such an apparatus, if the gas is in contact with air and the carbide is not properly cooled, to set fire to the gas.

Again, the lime absorbs water during the time it is hot and gives it out on cooling, so that the generation of gas goes on though nominally arrested. There have been accidents with this class of machines.

Class 2 are mostly machines combining a rising bell and a carbide charging apparatus: these are largely in use, and act fairly well provided ample means are taken to keep the carbide cool during generation. They are controlled by a rising bell, which automatically shuts or opens the water supply by its rise or descent. They may be subject to undue heat under the following conditions:—

Supposing the generator is fitted to contain a fixed charge of carbide intended to work at a certain rate per hour (*i.e.*, to light so many burners of a certain power), and the users, which is often the case, either use more or larger burners, the generation of the gas then goes on much quicker than the prescribed limit. The apparatus, suppose, is suddenly put out of use, the water supply is automatically shut off, and the carbide feeds on the small amount of water left. Hence three results may occur—either that a dangerous heat is set up; that the carbide may swell and prevent the little water present from getting to it; or that a disintegration of the acetylene takes place and foreign gases and tarry products result.

Class 3.—These are undoubtedly the safest forms, provided that carbide is *not* in a powdered form, but in fairly large lumps and fed in through an air- and vapour-proof hopper.

Hitherto it has been the custom in *automatic* machines of this class to feed with powdered carbide, released or actuated in some way by a hopper controlled by the action of a bell. But seeing that vapour to some extent is always produced by the falling of the powdered carbide into water, the tendency has been to form a conglomerate mass at the mouth of the hopper, consisting of pasty carbide, which prevents the free action of the apparatus. If, however, the carbide is fed in larger lumps, and through a vapour-proof hopper, the chances of success will be almost assured. Such a machine is now on trial and promises good results.

Comparative Cost.

The price of acetylene gas will always be governed by the price of carbide, assuming that 1lb. of carbide will give off 5 cub. ft. of gas which, when burnt in suitable generators at a low temperature, should give 240 candle-power, but as a matter of practice 230 candle-power should be a fair assumption.

---

* Papers read before the Society of Architects on Thursday, February 19th, 1903.

Carbide fluctuates in price owing to "corners" made by the manufacturers, restrictions put on the carriage of it (except in bulk). It may be taken, including delivery, cost of non-returnable drums, &c., at about 3d. per lb. in quantities of 1 cwt. and thereabouts. Some allowance must be made for the purifying material also.

Taking coal-gas at 2s. 6d. per 1,000 to cost 1d. per 33ft.: 33ft. should, under very favourable circumstances in the ordinary burners, give 70 candle-power, say 1¼d. per 100 candle-power per hour. One hundred and ten candle-power per hour with acetylene at 3d. per lb., 1½d. per hour. In districts—and there are many of them in country places—where coal-gas is 6s. 8d. and 7s. 8d. per 1,000 acetylene will come well to the fore.

Installation.

The installation is simple. The pipes need be about quarter the area of those for ordinary gas, and there is less heat given into the rooms, as only about one-tenth part of the gas by volume gives off equal light to coal-gas; the heat given off by a flame of equal intensity is about 1,000 C. for acetylene against 1,360 C. for coal-gas.

Taking a room to be well lit up with 70 candle-power, ordinary gas in bat's-wing burners would give off 20 cub. ft. of carbon dioxide in addition to about 60 cub. ft. of water vapour, and would remove about 26 cub. ft. of oxygen.

With acetylene the produce is only—

4 cub. ft. CO_2.
2 „ Water vapour.
5 „ Oxygen.

The pipes and fittings used should not be of copper, copper and silver having properties of forming acetylides of the metal when in contact with the gas and water. Iron and compo suit well, and the mountings of a good brass alloy with an admixture of tin. The cocks should be well ground in, and the joints of the system throughout made with a spirituous mixture, such as red lead and gold size, shellac and spirit. Ordinary red lead and oil is not suitable unless given a very long time to dry. As the pressure being much more than double and sometimes four times that of ordinary coal-gas, the weak parts are soon discovered by the gas, and unset joints made with oil may be blown through before they have time to set.

The whole system should be well tested, and allowed to stand for some hours with the pressure double that at which it is intended to work. Ordinary gas fitters are as a rule too careless, and qualified people should be engaged to fit up in every case, otherwise the apparatus may be blamed.

Purification.

Good results will be obtained for purification. Users can make a simple form of mixture with lime and coke sprinkled lightly over trays. The coke may be previously steeped in chloride of lime or hydrochloric acid; and a spoonful of chloride of lime to a bucket of water put into the tank acts as a purifier.

In winter it is well to have the bell working in a strong solution of salt (preferably chloride of calcium), as this mixture will not freeze in this climate under covered places where generators are likely to be kept; and again it is well to keep to this mixture for everyday work, as much less gas is absorbed by the saline water, ordinary water being able to take up 1·1 times its own volume, whereas a brine solution will only absorb 0·05 of its volume.

Portable Apparatuses.

So far no mention has been made of portable apparatuses, which must assume large proportions in the colonies and hot climates, where paraffin and coal-gas are difficult to procure and convey. Carbide in wet or dry climates, if treated by a preparation, can be made to resist the action of moisture for long periods. The treatment may be one.

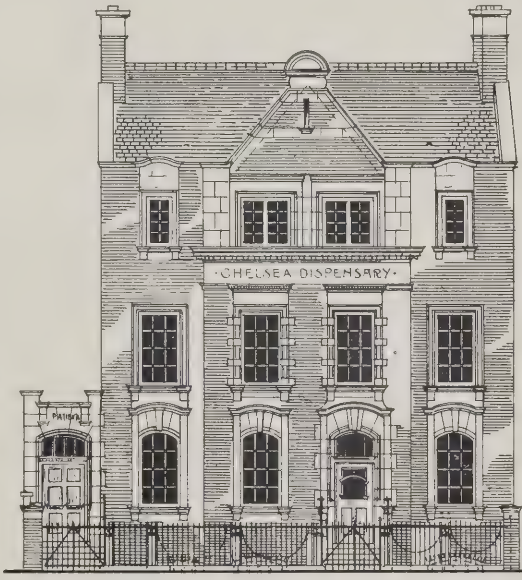
(1) By which the carbide is coated with a glucose mixture which absorbs the lime when mixed with a preponderance of water.

(2) Carbide intimately mixed in the plastic state, with heavy hydro-carbons.

(3) Carbide coated with an elastic varnish, coupled with a hydro-carbon capable of absorbing some of the impurities resulting in the generation of the gas, and capable of intensifying the flame.

No. 1.—Taking No. 1, the proportion containing glucose, which itself contains a certain proportion of water, naturally absorbs some of the lighting qualities of the gas, and adds a considerable weight to the compound. The glucose covering is readily attacked by moisture in the air and has to be kept in well-secured air-tight cases.

No. 2.—This mixture is not so subject to action by moisture as the heavy oils are incorporated in the mass, but weight for weight the amount of active carbide is far less as compared with the same weight of good active carbide, and consequently the gas production per lb. of material may be reduced 25 per cent.



A. W. SHEPPHARD AND J. F. BURKINSHAW, ARCHITECTS.

No. 3 is a process which treats the carbide without decreasing its efficiency in any way, either by contamination with nascent vapour or by dilution with extraneous oils. It amounts to a flexible film applied to the carbide under a temperature exceeding 212 degs. Fahr., at which no water can be present; it adds very little to the weight—about 2 per cent., an amount that is practically not worth considering, seeing that raw carbide may lose as much as 10 per cent. to 20 per cent of its gas efficiency if granulated or exposed during the ordinary process of turning off into small charges.

It will give off the full gas efficiency due to the carbide as it leaves the factory fresh from the furnace, the ingredients in the film helping to reduce the endothermic action of the gas generating process, thereby giving a purer gas, and at the same time absorbing many of the heavier vapours which tend to clog the burners.

The cost of this compound by weight, therefore, gives its best value for money.

I have alluded to prepared carbide only in connection with portable apparatuses, the reason being that in small apparatuses of this kind there is not gas-room sufficient for the development due to raw carbide; hence some form of carbide is generally used, treated in some way with a restraining medium.

Again, seeing that portable apparatuses are far more subject to exposure, it is almost necessary to have some means of protecting the charge.

F. WINDHAM, A.M.I.C.E.

WIDNES AND RUNCORN BRIDGE.

CONSIDERABLE progress has been made with the erection of this bridge during the last few months. The foundations are completed on both sides of the river, the eight large cast cylinders having been taken down to the solid rock, about 35ft. below the Manchester Ship Canal, and filled with strong Portland-cement concrete. These cylinders are more than 9ft. in diameter, and are braced together in clusters of four with strong steel bracing. In sinking these cylinders through the Ship Canal bed compressed air was adopted, the cylinders acting as caissons, which made the operation rather tedious on account of the excavated material having to be passed through the air-lock. The foundation cylinders on the Widnes side were most easily laid, the rock being bare at low water. A large portion of this rock was rotten at the surface, and had to be removed to get to the solid rock, to which the cylinders were securely bolted.

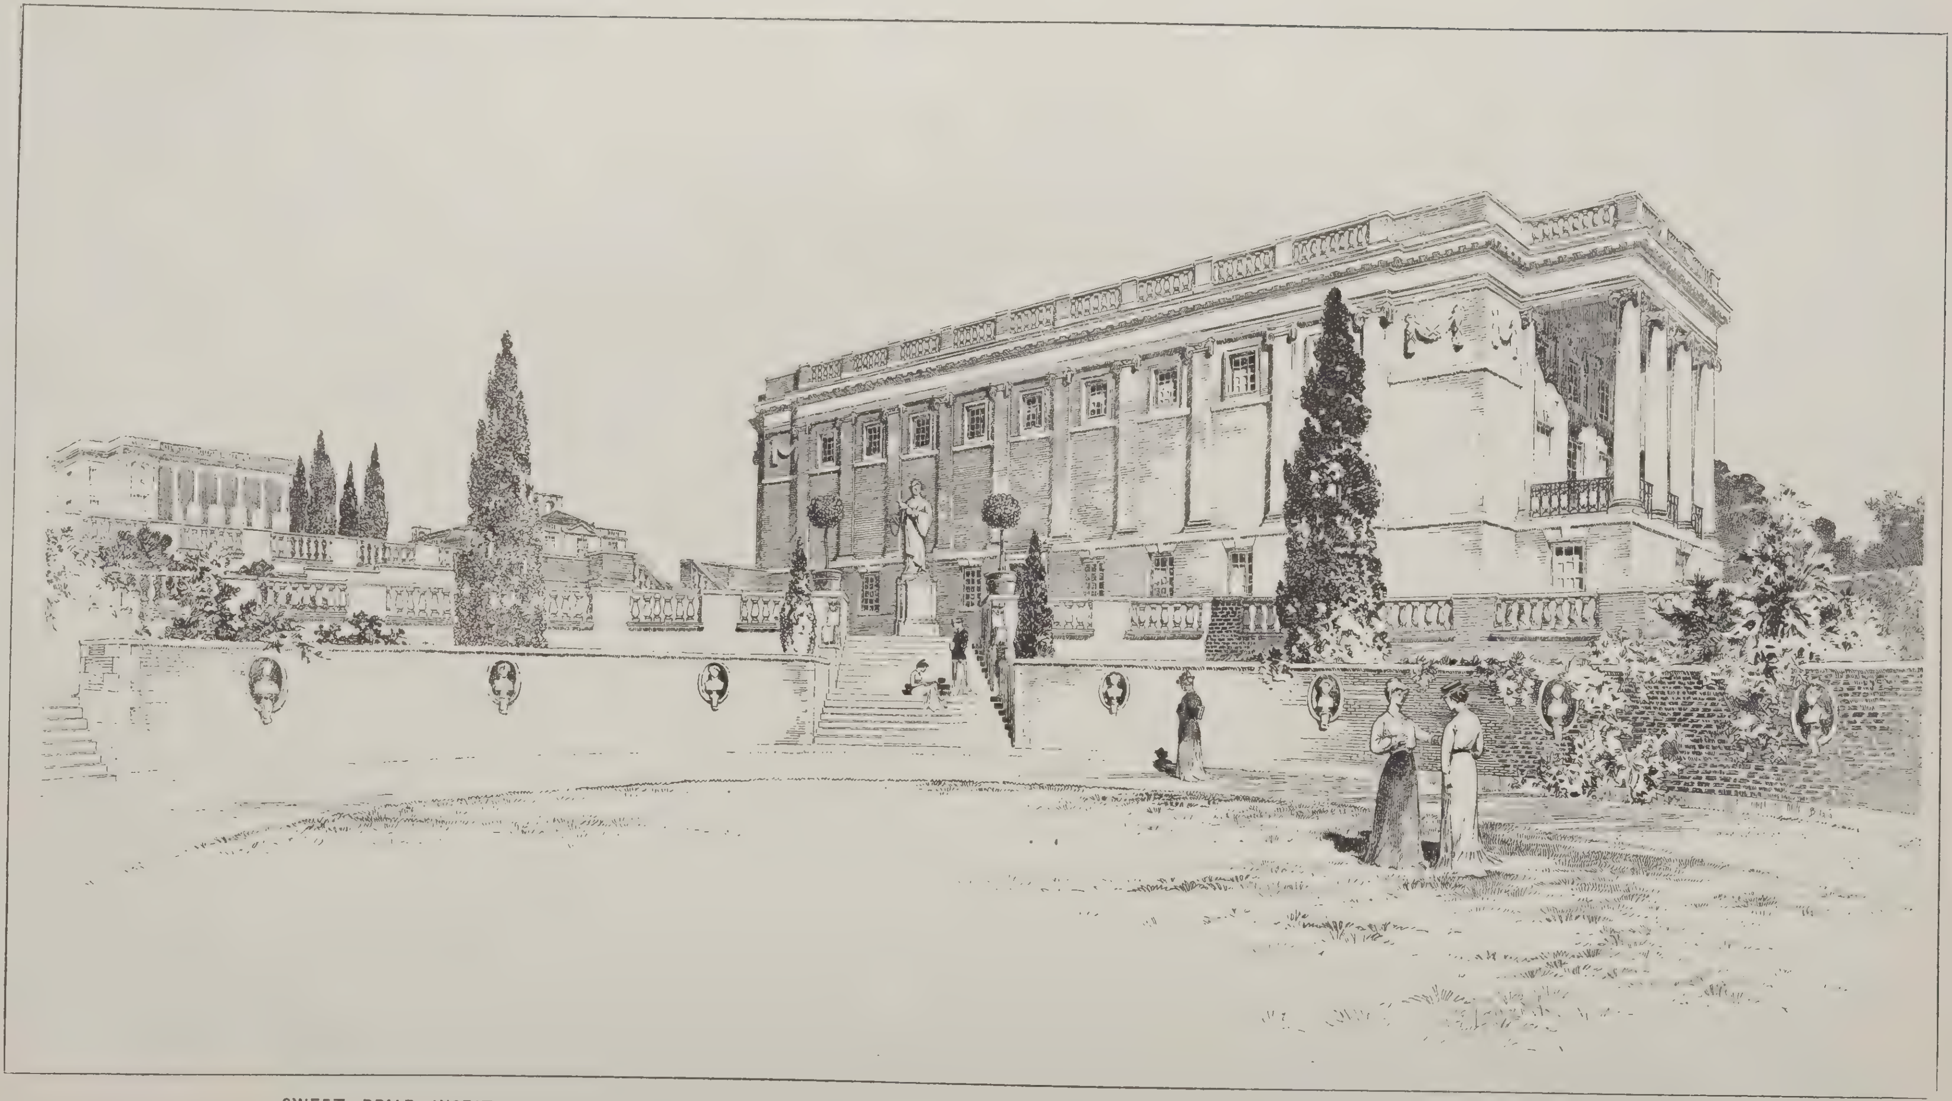
The erection of the four steel towers—to be about 190ft. high—will shortly commence, the erection being carried out simultaneously on the four clusters of cylinders on each side of the river. A tall braced steel "stallage," 140ft. high, will be used for the purpose, having a derrick crane on the top.

The anchorages are completed on the Runcorn side, and nearly so on the Widnes side, the massive anchor plates being embedded in the solid rock about 30ft. from the surface and filled in with strong cement-concrete. The masonry approaches on the Runcorn side, which have necessitated the construction of massive stone and concrete retaining walls, &c., are nearly completed, and will make a great improvement in the appearance of that part of the town. The towers will probably be completely erected by the middle of April, when the laying of the massive steel cables, each of 12in. diameter, will be commenced.

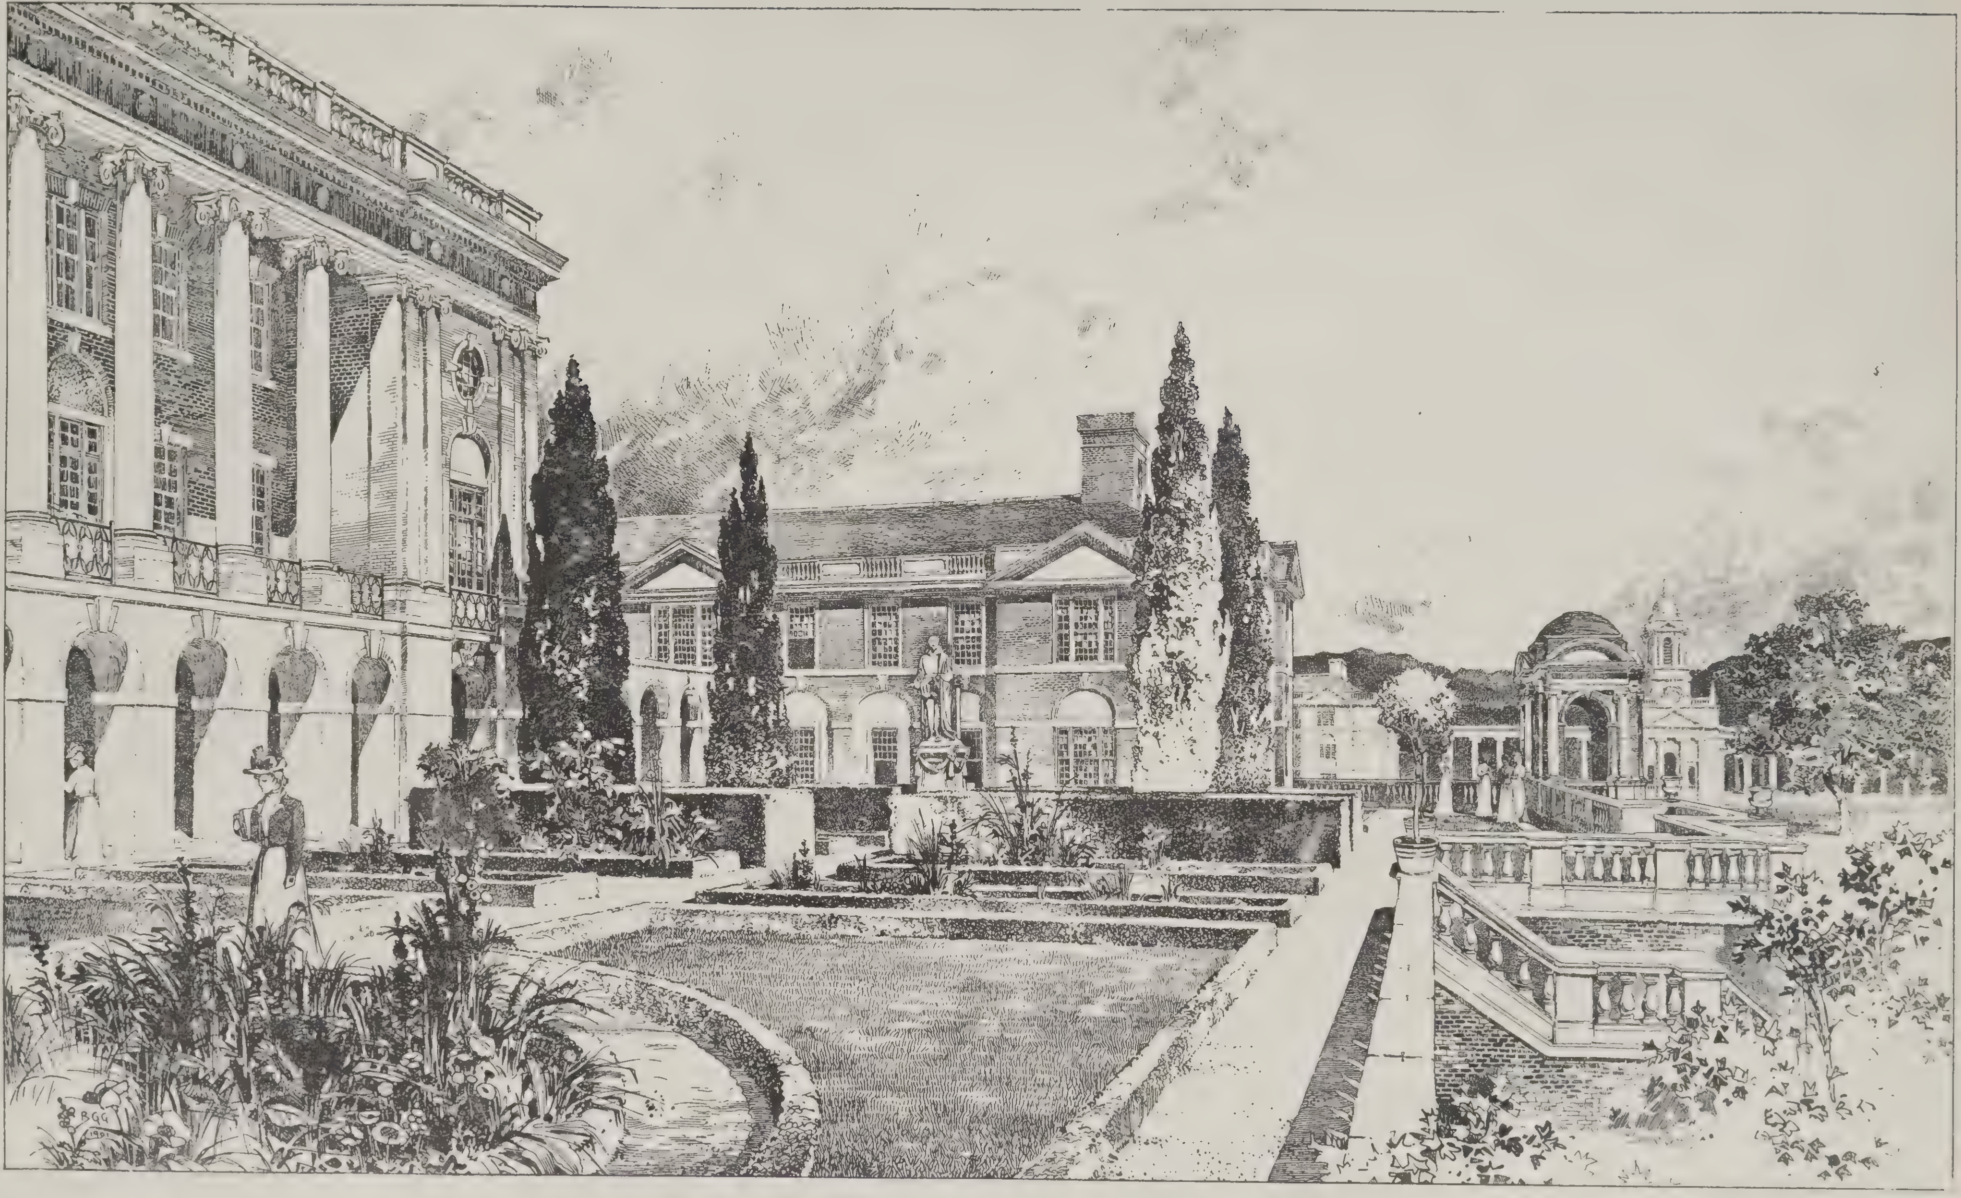
The bridge will be totally unlike any other structure in England. On account of the almost unique conditions and the great span of 1,000ft. clear, the design and erection must naturally be a source of great anxiety to the engineers, Mr. John J. Webster, M.Inst.C.E., of Westminster, and Mr. John T. Wood, M.Inst.C.E., of Liverpool; but everything at present points to the successful completion of the work.

The Chelsea Dispensary.—Lord Cadogan recently laid the foundation-stone of the new Chelsea, Brompton and Belgrave Dispensary now being erected in Manor Street in place of the old building at Sloane Square. Messrs. A. W. Sheppard & J. F. Burkinshaw of 21, John Street, Adelphi, W.C., are the architects. The main structure is being built of red brick relieved with terra-cotta dressings. A residence will be provided for the house surgeon; a committee room, &c., for the management, spacious waiting and consulting rooms, with an isolation room and dispensing department and workrooms attached are also provided. It is hoped that the building will be opened this summer. The builders are Messrs. Stimpson & Co., of 78, Brompton Road, W. The cost will be £3,000.

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD,
Wednesday, March 4th, 1903.



SWEET BRIAR INSTITUTE VIRGINIA, U.S.A.: THE GYMNASIUM FROM THE BASE COURT. CRAM, GOODHUE AND FERGUSON, ARCHITECTS.



SWEET BRIAR INSTITUTE, VIRGINIA, U.S.A.: ON THE UPPER TERRACE. CRAM, GOODHUE AND FERGUSON ARCHITECTS.

Keystones.

Turner's House at Twickenham—Sandycombe Lodge—is to be sold by auction. It is said to have been designed by Turner himself.

The Cottage Hospital at Dunfermline is being extended by large additions to the east and west wings from plans by Messrs. Sydney Mitchell & Wilson, of Edinburgh, at a cost of about £3,000.

At All Saints' Church, Bubworth, Yorks, a new oak screen and clergy and choir stalls have just been installed from the designs and under the superintendence of Mr. G. Malam Wilson, M.S.A., of Sheffield.

The King's Sanatorium.—Arrangements for the purchase of a site near Haslemere for the King's consumption sanatorium are practically completed. The site is 600ft. above sea-level and about 120 acres in extent.

Capetown Exhibition.—An exhibition of British and South African industries is to be held at Capetown towards the end of October next. The object is to bring the British manufacturer and the Colonial market more immediately together.

Glasgow Institute of Architects.—At last week's meeting the secretary reported that the Technical College prize had been awarded to Mr. Vernon Constable. It was agreed to continue the School of Art prizes given by the Institute, and Messrs. Boston & Keppie were appointed adjudicators.

City Churches.—In the House of Commons last week, on the motion of Mr. Talbot, a return was ordered to be presented of the churches in the City of London pulled down or condemned during the period from August 2nd, 1894, to December 31st, 1902, with full particulars of the circumstances.

In the Royal Academy Schools this year is an important one, for the biennial gold medals and travelling studentships are being competed for. The Creswick subject for the decoration of a portion of a public building is "Charity," and for the cartoon prize "Victory." In architecture the gold medal and travelling studentship of £200 will be given for the best design for a domed church of 40ft. span and not less than 120ft. long inside.

Leeds and Yorkshire Architectural Society.—A paper on "Street Improvements in Leeds and Elsewhere" was read before last Thursday's meeting of this Society by Mr. Frederick Musto, A.R.I.B.A. He said the aspect of the streets and most of the buildings of Leeds was far behind Manchester, Liverpool, Glasgow and even smaller towns like Leicester and Newcastle. "There is an air almost of squalor in Leeds that even the City Square and Boar Lane cannot destroy, and that certainly Briggate will not reduce. "He hoped it would be a long time before the dignity of City Square was spoiled by the ceaseless careering of trams round it. The corner between Cookridge Street and Park Row was a typical Leeds crossing, with a terrible "splayed line." Criticising the present scheme for widening Cookridge Street, he contended that the building line should be set back so that the Leeds Institute closed in the vista. Briggate he described as "too sad for words." With regard to what might be done, Mr. Musto suggested a line of access from the end of Roundhay Road to Woodhouse Lane, near Carlton Hill. He would like, too, to see a street cut in prolongation of Oxford Place by Park Square to Park Place; and a better access to the Yorkshire College and Grammar School than was provided by the present College Road, with its plentiful supply of back areas and middens.

The Engineering Standards Committee published the results of their investigations on Monday last.

Messrs. J. & W. Henderson, of Aberdeen, have secured the contract for about 6,000 tons of cement from Messrs. Morrison & Mason, Ltd., Glasgow, the contractors for the new Ferryhill Viaduct.

A Monument to the late Archbishop Temple is proposed to be erected in Canterbury Cathedral at a cost of £500. Mr. Caröe is suggested as the architect and Mr. Pomeroy the sculptor.

Birmingham Municipal School of Art: Head-Mastership.—This position will become vacant in September next, on the retirement of Mr. Edward R. Taylor. Enquiries should be addressed to the secretary, and applications for the appointment to the chairman of the management sub-committee, Municipal School of Art, Birmingham. The latest date for receiving applications is Saturday, March 21st.

Royal Academy Exhibition, 1903.

The receiving day for architectural works at this year's Royal Academy Exhibition is Friday, March 27th. We shall be pleased, as in previous years, to receive drawings from intending exhibitors, and undertake to deliver them at Burlington House free of charge; but they must reach us at latest *by noon on the day mentioned. The* earlier *they are sent the better.*

Law Cases.

Harrogate Building By-Laws.—In the King's Bench Division of the High Court of Justice the special case stated between the Mayor and Corporation of Harrogate and Mr. Dickinson, a builder in that borough, was recently heard, the issue being as to the rights of builders who deposited plans under the old by-laws of the town to continue the work to which those plans related under the new borough by-laws and under the Local Act of 1893.—Counsel for the plaintiff said that the defendant deposited plans in 1894 for the erection of dwelling-houses and stables on land in Walker Road and Bilton Drive. The houses were duly erected, but on the defendant proceeding to build a stable and coach-house at the beginning of last year the inspector employed by the Corporation gave him notice that he was to discontinue building and deposit fresh plans, the old ones not complying with the new by-laws in several particulars. Some of the houses had been completed, and satisfied the old by-laws, but there was a question in reference to others as to which it was required that the new by-laws should be complied with.—Mr. Justice Wright in delivering judgment said the builder claimed that the old by-laws applied, because 117 of the new by-laws, repealing the old ones, excepted two classes of cases, and it was argued that the buildings now in question formed one or other or both of these exceptions, and were therefore governed by the old and not by the new by-laws. In fact, the whole case was based on the view that these plans, which were approved in 1894 by the then sanitary authority, were one plan. If it was one plan for the whole of the purposes of this case, then there was no question that the work was commenced on that plan, and that the approval of the Corporation was still in force. He did not think the grounds which had been advanced were maintainable. It seemed to him that this was simply a number of plans for convenience put on one sheet of paper in order to show the sanitary authority what the general scheme of arrangement was to be. The old by-laws provided for a plan of each building, and if the present was not a plan of each building, then he very much doubted whether the by-laws had been complied with at all. He could not agree with the argument that because some of the buildings had been commenced, therefore all had been commenced. Judgment must therefore be for the plaintiff corporation.

LONDON COUNTY COUNCIL.

At last week's meeting of the Council a report was presented from the Improvements Committee in respect to the widening of the Hampstead Road. The question has been several times before the Council, but it has been decided in the past not to proceed with the improvement unless the borough council gave sanction to tramways being laid along the Tottenham Court Road. It was recommended: "That the estimate of £245,500 submitted by the Finance Committee be approved and that the Improvements Committee be authorised to incur expenditure on capital account up to the amount named for the purpose of the widening of Hampstead Road at the southern end." After a long discussion an amendment was carried referring the matters back for further consideration.

The Colney Hatch Fire.

The Asylums Committee, reporting on this fire and the verdict of the coroner's jury, stated with regard to other temporary accommodation that the temporary buildings of the Manor Asylum and the Hanwell annexe were constructed with plastered interiors on steel lathing. The annexe for males at Banstead, though matchboarded, was not of the same design as the buildings which were destroyed at Colney Hatch. They had, however, thought it desirable to make certain alterations in the corridors so as to minimise the danger in the event of an outbreak of fire. They were also, with the same object and with the knowledge and concurrence of the Commissioners in Lunacy, having alterations carried out at the Manor Asylum and Hanwell temporary buildings. They hoped, as soon as possible, to report to the Council as to further asylum accommodation now necessary and the manner in which they thought it should be provided.

Mr. J. R. Cousins said the Council was the authority for the structure of the buildings and for the proper means of escape from fire. He therefore thought they should destroy the temporary buildings, which were admittedly faulty in construction. In his opinion the Council were greatly to blame in allowing the temporary buildings to be constructed at all. Mr. Hubbard, chairman of the Committee, said that until the recent fire they had not the least idea that the building could catch fire in such a way, and with their exits they had believed that the patients could have been got away in a few seconds. The insurance companies did not think there was much risk, for they insured the buildings at 2s. 6d. per cent. With regard to their other asylums, at Banstead they had removed the felt and wood from the roof and the corridor, and proposed to lay down a concrete floor. At Hanwell, where they had a subway running along the corridor, they were building up walls to prevent a draught. They were trying to remove their patients to permanent buildings as quickly as possible. The water-supply was adequate at these asylums. The Council were licensing buildings in London which were built on exactly the same lines as those destroyed at Colney Hatch. The Committee had someone constantly on the watch in a dormitory night and day. They had also a hose, the turn of one wheel sufficing to pour volumes of water on to the fire. They thought, therefore, that all proper precautions were taken.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Buildings to Measure around Ealing.

London, W.—Gothic writes: "Are there any old country churches within easy cycling distance of Ealing which would be worth measuring for the R.I.B.A. Intermediate Examination?"

There seems to be little which would be of use nearer than St. Albans, and the abbey-church there has been so drastically "restored" that little original work could be found for the purpose mentioned. Would Windsor be too far away? G. A. T. M.

Practical Geometry.

Bradford.—Calculation writes: "Which is the best book suitable for home study for the Science and Art Department examination in practical plane and solid geometry, Advanced Stage?"

Angel's "Practical Geometry and Projection," 2 vols. (Collins, 10s.) is the best general text-book on the subject, but recent developments of the syllabus render some study necessary of modern graphic algebra as indicated in Hall's "Short Introduction to Graphical Algebra" (Macmillan, 6d.).

HENRY ADAMS.

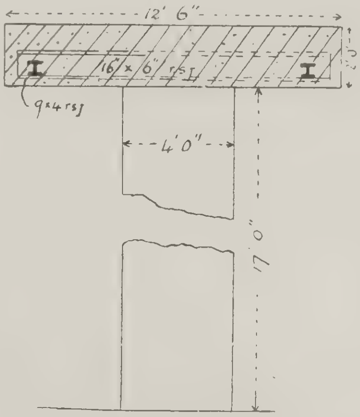
Claims for Extras due to Shrinkage of Tracing Cloth.

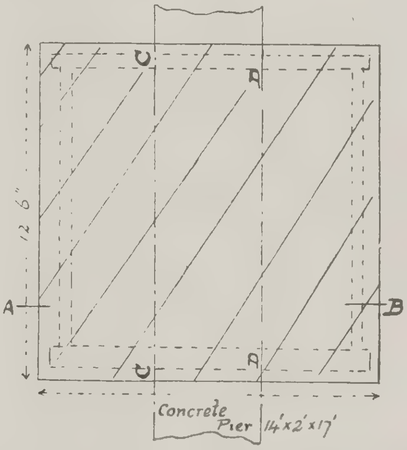
London, N.—Munro writes: "(1) A. contracts with B. to build three shops and premises for him from plans, &c., prepared by C. The size of site scaled from the plan shows it to be 60ft. by 100ft. 3in., but from actual measurements when the job was started it was found to be 60ft. $10\frac{1}{2}$in. by 101ft. 3in. A., at the completion of the work, sends in an claim for an extra on the increased size of the site beyond what was shown or provided for in specification or quantities. B. refuses this claim and lays the responsibility on C., who makes the excuse that as the drawings used as the contract drawings and the copies given to A. were sun-prints from cloth tracings made by C. from accurate pencil drawings, he is not liable or responsible for the shrinking of the tracing cloth. No written order was given to A. to do these extra works. What course should A. adopt to have his claim met? (2) Is it possible to get a tracing cloth that will not shrink after use sufficiently to cause serious mistakes? I can never depend on cloth tracings being accurate, and especially so when coloured."

(1) A. seems to have put himself out of court by not calling attention to the discrepancy when it was first noticed, as it must have been when the work was set out. There are, also, one or two points which the question does not elucidate. One is the responsibility for the quantities. If taken out by C. from his pencil drawings they should be accurate. Besides this, if the scale was, as it usually is and always should be, *drawn* on the tracing cloth, it would have shrunk together with the cloth, and the work would scale accurately to the scale given. On the other hand, if the scale was merely described in words, the architect was certainly guilty of negligence in not either drawing it or figuring his dimensions, it being common knowledge that both tracing cloth and sun-prints are unreliable in scale; and it is even to be feared that a certain class of architects, knowing this, will deliberately omit dimensions and the drawn scale to obtain very full money's worth for the building owner—which, if proved, would be fraud. Summing up, it therefore seems that action against the employer would probably fail owing to acquiescence when the error was discovered, while action against the architect for negligence might succeed; but a local solicitor should be consulted, with whom all points could be discussed. (2) No. Dimensions should be given very fully, and the scale drawn on. G. A. T. M.

Strength of Concrete Slab.

Newcastle.—Concrete writes: "How should the safe distributed dead load be found on a square slab of concrete 2ft. thick supported along the centre only on a concrete pier 4ft. wide? The slab is stiffened by a frame of rolled steel joists. It is twelve months old and gauged 6 to 1, clean clinkers and sand and Portland cement of sound quality. In an exposed position should allowance be made for wind-pressure on a rectangular-shaped load?"





In order that the total load, say, of bricks, for example, may be distributed equally over the slab it must be piled in three distinct sections, separated by the lines C C and D D; and no interlocking or bonding or mutual support in any way of these three sections of load must take place across those dividing lines. It is obvious that the middle section of load could never crush the slab, for before the slab would crush under direct compression the foundations would yield, or the stability of the wall itself would be overcome. We must therefore first ascertain how much load the overhanging portions of slab would safely bear, and then we can pile the middle section of load to the same height as the side sections so as to produce an equal pressure on every square foot of the slab. Each of the two overhanging portions of the slab is virtually a cantilever, projecting 51in., 150in. wide and 24in. deep. The centre of pressure of the equally-distributed load on each cantilever is at $25\frac{1}{2}$in. out from the face of supporting wall. Thus the length of the lever by which the overhanging load produces its greatest bending moment is $25\frac{1}{2}$in., while the length of the counter-lever by which the slab resists that load is 24in., *i e.*, the depth of the cantilever. Let w = the load equally distributed over each of the cantilevers. Then $w\,\frac{25\frac{1}{2}}{24} = 1{\cdot}0625\ w$ = the total stress of each of the overhanging loads, which occurs in each case at the intersection of the cantilever with the face of the supporting wall. The safe stress (tensional) on concrete, of such quality as is specified in the question, may be taken as $= \frac{1}{37}$ ton per in. of sectional area at the plane where the face of supporting wall intersects cantilever. The safe stress (tensional or compressional) on steel rolled joist may be taken as = 6 tons per in. The 16in. by 6in. joist weighing 62lbs. per ft. has sectional area = 18·6in. Thus the safe stress in two of those joist. = 2 × 18·6 × 6 = 223·2 tons. The sectional area of cantilever at wall-face plane = 150 × 24 = 3,600in. 3,600 − (2 × 18·6) = 3,562·8in. × $\frac{1}{37}$ ton = 96·29 tons = safe stress on concrete. 223·2 + 96·29 = 319·49 tons = safe stress on each concrete-steel slab cantilever. $\frac{319{\cdot}49}{1{\cdot}0625} = 300{\cdot}69$ tons = safe load distributed on each cantilever. 150in. broad × 51in. projection = 7,650in. = top surface area of one cantilever. 150^2 = 22,500in. = top surface area of entire slab. $\frac{300{\cdot}69 \times 22{,}500}{7650}$ = 884·38 tons = safe load distributed on slab. Would the wall carry this load safely? The two 9in. by 4in. joists are quite useless, and will do more harm than good. If the two 16in. by 6in. joists were omitted, the concrete slab would carry safely $\frac{96{\cdot}29}{319{\cdot}49} \times 884{\cdot}38 = 266{\cdot}2$ tons distributed. This weight would be safely carried by the wall. As "Concrete" gives no particulars of the nature of the proposed load, I must answer his question about the wind by supposing the load to be, say, a solid pile of bricks, having an area of base $= 12\frac{1}{2}^2$ = 156·25ft. Taking the weight of 1 cub. ft. of brickwork as = 1 cwt., the 884·38 tons load would occupy 884·38 × 20 = 17,687·6 cub. ft. $\frac{17{,}687{\cdot}6\text{ft. volume}}{156{\cdot}25\text{ft. base area}}$ = 113·2ft. = height of brickwork load (!). 113·2 + 2ft. thickness of slab + 17ft. height of wall = 122·2ft. = total height of surface resisting the wind. 122·2 × 12·5 = 1,527·5ft. = area of rectangular surface resisting the wind. $\frac{122{\cdot}2}{2}$ = 61·1ft. = height above ground of centre of horizontal wind-pressure. $\frac{1}{40}$ ton = greatest wind-pressure per ft. of resisting area in an exposed place. $1527{\cdot}5 \times \frac{1}{40} \times 61{\cdot}1 = 2333{\cdot}25$ft. tons = moment of greatest wind-pressure. 18 tons slab + 42 tons wall beneath slab + 884·38 tons load = 944·38 tons = total weight of structure and loads resisting the wind. $\frac{2333{\cdot}25}{944{\cdot}38}$ = 2·47ft. = effective base needed to counterbalance the overthrowing force of the wind. But the effective base provided is = $\frac{1}{3}$ width of supporting wall, *i.e.* $= \frac{4\text{ft.}}{3}$ = only 1·33ft., thus leaving a deficiency of at least = 2·47 − 1·33 = 1·14ft., so that the wind force above specified would overthrow the structure and its 884·38 tons load.

FRANK CAWS, F.R.I.B.A.

Fixing Pencil Drawings.

Blackpool.—E. S. E. writes: "Please name a good recipe for preventing the pencil from smearing on drawings."

Washing with milk, or even tea, will be effectual. There are good fixatives which can be obtained at any artists' colourman.

Labourers' Cottages.

Harpenden. — Church Green writes: "Which are the best recent publications, newspaper articles or correspondence on the question of cottages for labourers in villages and country towns? I want something which goes into the question of cost and wages, as well as planning and material?"

Write to the publisher, "Country Life," Geo. Newnes, Ltd., 20, Tavistock Street, Covent Garden, W.C., and The Country Gentlemen's Association, Ltd., 16, Cockspur Street, S.W.

Designing Tall Chimneys.

Bradford.—Calculation writes: "Kindly give an example of calculations required to get the height and the width at top and bottom of a factory chimney."

Suppose the chimney to be wanted for two Lancashire boilers each having two furnaces 2ft. 6in. wide and 6ft. long. The grate-surface will be 2·5 × 6 × 2 × 2 = 60 sq. ft. The area of flue should be one-fifth of this, say 12 sq. ft., or say 2ft. 6in. wide and 5ft. high at centre. The sectional area of chimney should be half that of the main flue, say 6 sq. ft., or 2ft. 6in. square. The height may be taken as 80ft. By London County Council regulations the chimney shaft must be not less than one-brick thick for the top 20ft., and set off inside half-brick thicker every 20ft. below. The batter must not be less than 2½in. in 10ft., and the width at base must be not less than one-tenth of the height. The projection of the cap must not exceed the thickness of the brickwork supporting it. The usual bond is English, or for circular shafts not more than four courses of stretchers to one of headers. Lias lime mortar is considered to be superior to Portland cement for building a chimney shaft, as it is said to be less rigid and to stand heat better. Hoop-iron bond may be inserted if desired at intervals of about 5ft., interlaced at the junctions. The design may now be drawn out as shown by the accompanying illustrations, but before completion it would be well to calculate the stability as follows:—

Let—

p = wind-pressure lbs. per sq. ft. on normal surface.
P = total pressure of wind.
x = leverage of wind or height from centre of gravity of surface from ground line.
w = weight of brickwork lbs. per cub. ft.
W = total weight of chimney above ground line.
y = leverage of resistance or distance of resultant of thrust from centre line in feet.
l = distance of resultant of thrust from outer edge in feet.
A = area exposed to wind in sq. ft.
H = height in feet.
b = width of base in feet.
t = width of top in feet.

Then—

Effort = Resistance, or $P.x = Wy$.

$$A = \frac{H(t+b)}{2} = p\frac{80(4+8)}{2} = 480 \text{ sq. ft.}$$

$$P = A \times p.$$

$$x = H\frac{b+2t}{3b+3t} = 80\,\frac{8+8}{24+12} = \tfrac{4}{9} \text{ of } 80 = 35\dot{5}\dot{5}\text{ft.}$$

W = say 100 tons approximately.

$$l = \frac{2b^2 - t^2}{6b} = \frac{(2 \times 8^2) - 4^2}{6 \times 8} = 2\tfrac{1}{3}\text{ft.}$$

$$y = \tfrac{1}{2}b - l = 4 - 2\tfrac{1}{3} = 1\tfrac{2}{3}\text{ft.}$$

Now $x : y :: W : P$.

$$\therefore P = W\frac{y}{x} = 100 \times 2240 \times \frac{1\frac{2}{3}}{35\frac{5}{9}} = 10{,}500\text{lbs}$$

and $p = \frac{P}{A} = \frac{10500}{480} = 21{,}875$lbs. per sq. ft., the safe wind-pressure upon the chimney shaft, or, in other words, the wind-pressure acting uniformly over the whole surface, which will make the pressure *nil* on the inner edge and a maximum on the outer edge.

There is no doubt that in ordinary situations this would be sufficient, as the assumed maximum of 56lbs. per sq. ft. is only reached in very exposed situations, and there is no proof whatever of the alleged pressure of 80lbs. per sq. ft. said to have been observed at Liverpool in 1868. The whole question of wind-pressure as measured by velocity is in a chaotic state, and should be taken up by some competent authority.

HENRY ADAMS.

"Academy Architecture."

Maidenhead.—J. W. writes: "Is there any record published of the drawings at the Royal Academy, similar to the special number of the 'Architectural Review' which used to be issued?"

Yes. "Academy Architecture," published annually in two volumes, the first in June, the second in December. Apply to the proprietor and publisher, Alexander Koch, 58, Theobald's Road, London, W.C.

Building, &c., Inspector.

York.—M. E. W. writes: "I have a friend who is desirous of studying to qualify as a sanitary and building inspector, but he has lost the use of his left hand. Do you think this would be detrimental to his success in getting such a post under a local authority?"

As your friend would in the ordinary course of his duties have to mount ladders and walk about scaffolds, also descend manholes and sewer-trenches, we fear he would find the loss of his left hand rather a serious matter. His success in obtaining such an appointment is dubious, as he would probably be in competition with a large number of men having the use of all their limbs.

Dancing Floor.

Victor writes: "Kindly give me some idea of the construction of a spring-floor for dancing, about 70ft. by 40ft."

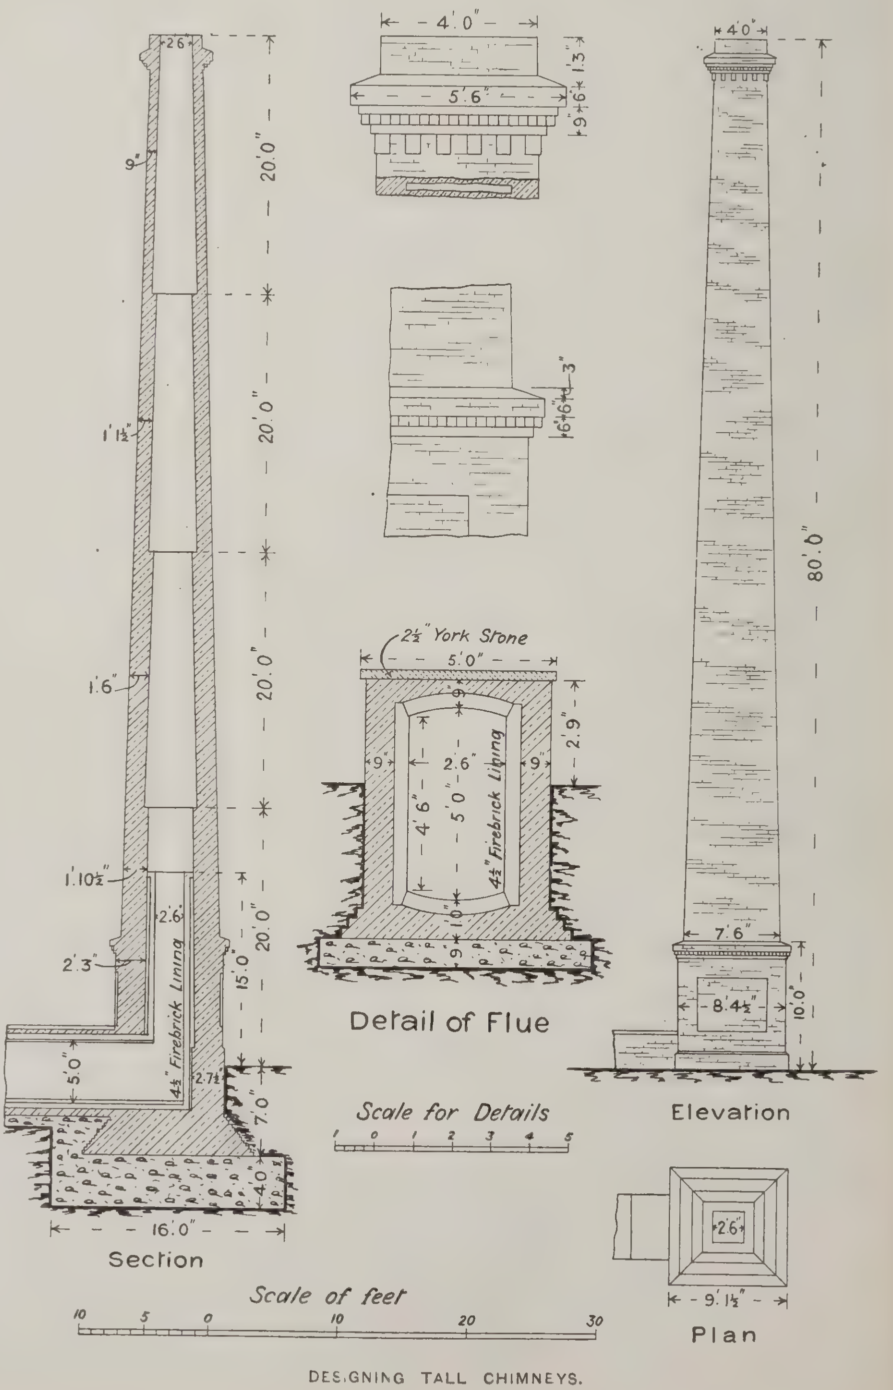
See our issue for January 26th, 1898.

The Society of Architects.

London.—Registration writes: "Is it of any value to an architect to be a member of the Society of Architects?"

The Society, of course, gives its members a certain standing, and, in addition, there are the advantages of social intercourse, the hearing of papers read, and other matters helpful to an architect. See our issues for October 19th, 26th and November 2nd, 1898.

The London Master-Builders' Association Diary and Handbook for 1903 has been issued, price 2s. 6d. (31 and 32, Bedford Street, Strand). It contains a great deal of useful information.



DESIGNING TALL CHIMNEYS.

LONDON BUILDING ACTS (AMENDMENT) BILL, 1903.

By EDWIN B. B. NEWTON, A.M.I.C.E., F.S.I.

(Concluded from p. 20, No. 420.)

PART 3 deals with provisions for reducing risk of fire in buildings, separation of buildings or staircases, passages, &c.

Section 17 details certain provisions which are to take effect in lieu of section 74 of the Act of 1894. The latter section, 74, deals with the matters in three sub-sections.

The first is as follows: "Every building shall be separated either by an external wall or by a party wall or other proper party structure from the adjoining buildings (if any) and from each of the adjoining buildings (if more than one)." The new enactment is similar, but the word "proper" before the words "party structure" above is omitted and the following words added after ". . . more than one)," "and every such party structure shall be constructed of incombustible materials to the satisfaction of the Council." That is to say, the words "and . . . Council" are in substitution for the word "proper." The use of the word "incombustible" and not "fire-resisting" is noteworthy. Both words are used in the Act of 1894.

The second sub-section of section 74 of the Act of 1894 is as follows: "In every building exceeding 10 squares in area used in part for the purposes of trade or manufacture and in part as a dwelling-house the part used for the purposes of trade or manufacture shall be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials and all passages staircases and other means of approach to the part used as a dwelling-house shall be constructed throughout of fire-resisting materials. The part used for purposes of manufacture shall (if extending to more than 250,000 cub. ft.) be subject to the provisions of this Act relating to the cubical extent of buildings of the warehouse class. Provided that there may be constructed in the walls of such staircases and passages such doorways as are necessary for communicating between the different parts of the building and there may be formed in any walls of such building openings fitted with fire-resisting doors."

Section 17 (5) of the new Bill is similar, but is more elaborate. The words commencing on the line (*ante*) "separated from . . . . fire-resisting materials" are altered so as to read "separated from the part used as a dwelling-house vertically by walls or partitions and horizontally by floors, such partitions and floors to be constructed of fire-resisting materials other than wood." Walls, unless deemed to be partitions, need not apparently be fire-resisting, though no doubt the Act of 1894 already ensures this.

The desirability of this limitation of the use of wood is doubtful. Whatever may be one's opinion as to the value as a fire-resisting material of wood specially impregnated with various chemicals so as to obtain fire-resisting qualities, it is the view of by no means a small number of those who are qualified to give an opinion in the matter that there are few safer and more reliable fire-resisting materials than *solid* wood (particularly if it be hardwood) when used of a considerable thickness, say of more than 6in.

A floor of solid timber 12in. to 14in. thick would be in many cases much more capable of resisting fire than some of the so-called fireproof combinations of concrete and iron.

The words in section 74, "means of approach" (*ante*) are extended by the addition of "from the street," and, in addition to being constructed of fireproof materials, they must be "encased with" them, and the fireproof materials are to be "other than wood to the satisfaction of the district surveyor."

By the new section 17 (6) definite widths for all such "passages, staircases and other means of approach" are set forth, varying according to the frontage of the building (ignoring the return frontage of a corner building). For a frontage of 20ft. the width of the passage or staircase is to be at least 2ft. 6in.; for one exceeding 20ft., but not exceeding 30ft., 3ft.; and for one exceeding 30ft., 3ft. 6in.

It would seem preferable that staircases and other means of exit from such buildings should be governed by extent and area of buildings rather than by frontage, as cases are conceivable where a very large building might have but a small frontage.

It would be interesting to know in what manner the widths of passages in relation to street frontage were arrived at. It cannot be said they are excessive, but the widths and the variations in them seem difficult to justify.

A staircase enclosed and constructed as aforesaid is now [section 17 (7)] to be provided in every such building as is referred to in section 17 (5) and (6) and which has any storey above the ground storey, and if there be any space between the foot of such staircase and the street, a passage as before mentioned is to be provided, "unless means of escape to the satisfaction of the Council are provided from the side, rear or roof of the building." The last nine words appear to be quite unnecessary.

By section 17 (8), if the frontage of such a building exceeds 40ft. another such staircase, and if requisite a passage as before, shall be provided, unless the Council otherwise permit, for every 40ft. or part thereof beyond the first 40ft.

Section 17 (9), with some modifications, corresponds to the provision in section 74 (2) of the Act of 1894 (*ante*). Instead of the words "there may be formed in any walls of such buildings openings fitted with fire-resisting doors" the words used are, "all internal doorways leading from the portion of the building used for trade or manufacture to such staircases and passages shall be fitted with self-closing doors of fire-resisting material hung on frames of fire-resisting material."

The third sub-section of section 74 of the Act of 1894 is as follows: "In every building exceeding 25 squares in area containing separate sets of chambers or offices or rooms tenanted or constructed or adapted to be tenanted by different persons the floors and principal staircases shall be of fire-resisting materials. But this provision shall not entitle the district surveyor to charge for the inspection of each set of chambers as a separate building."

By section 17 (2) of the new Act such chambers as these when "contained in one building shall not, although approached by distinct staircases or separate entrances from without, be deemed to be separate buildings, but all sets of chambers or offices or rooms tenanted or constructed or adapted to be tenanted by different persons shall, if contained in a building exceeding 20ft. in height and 8 squares in area, be separated vertically by walls or partitions and horizontally by floors and partitions and floors to be constructed of fire-resisting materials other than wood,* and if such separate sets of chambers or offices or rooms are contained in a building exceeding 25 squares in area the floors of the lobbies, corridors, passages and landings, and the principal staircases of such building, shall also be of fire-resisting materials."

By section 17 (3) "a district surveyor shall not be entitled to charge for the inspection of each such set of chambers or offices or rooms as a separate building."

By section 17 (4) no building containing separate sets of chambers or offices or rooms tenanted or constructed or adapted to be tenanted by different persons shall without the consent in writing of the Council extend to more than 50 squares in area.

The severity of the section is modified by the sub-sections 10 and 11, the former of which permits (except for the purpose of a party structure separating buildings) the use of wooden joists with concrete pugging at least 5in. thick for the construction of fire-resisting floors, while the second enacts that buildings commenced before the passing of this Act may be completed under the provisions of the Acts previously in force.

There is considerable ambiguity in section 17, particularly on account of the omission of commas.

Admirable as the object of these sections is, there can be little doubt that in some cases the imposition of all the conditions imposed by them would involve great expense and unnecessary hardship.

Projecting Shops.

Section 18 deals with the important case of a shop building the front of which projects beyond the main wall.

(1) Where such a part of a shop "erected, re-erected or re-constructed after the passing of this Act projects for a distance of 5ft. or more beyond the main front of any building of which it forms part, and in which building any persons are employed or sleep," the roof of such projecting portion is to be fire-resisting and at least 5in. thick, and an enclosed passage constructed of fire-resisting materials other than wood,* to the satisfaction of the district surveyor, is to be provided from the street to the staircase or other approach to the portion of the building other than that used as a shop, unless means of escape to the satisfaction of the Council be provided from the side rear or roof of the buildings.*

(2) Such passages are to be of a width according to the frontage of the building (excluding the return frontage of corner buildings). For a frontage not exceeding 20ft., the passage is to be at least 2ft. 6in. in clear width; for one exceeding 20ft. but not exceeding 30ft., 3ft.; and for one exceeding 30ft., 3ft. 6in.*

(3) If such frontage exceed 40ft. another staircase, and, if requisite, an enclosed passage as before, are to be provided for every 40ft. or part thereof beyond the first 40ft.

(4) Lantern lights not exceeding in area one-tenth that of such roof may be placed thereupon, but not nearer than 4ft. to the main front of the building, or within 4ft. of any other external or party wall. The sides of such lantern, except the front to the street, are to be carried up 2ft. above the roof, and every part of such lantern within 6ft. of the main front is to be fire-resisting. No part of such lantern is to project above the roof more than 4ft.

The provisions of this section are most desirable, but whether it is sufficiently severe to entirely render such a building capable of affording means of escape in all cases of fire is open to some little doubt.

No one is referred to as having authority to decide what materials may be used in the case of the roof, and this would seem to be more important than the passage.

Panelling.

Section 19 requires boarding or panelling, used as internal finishing to walls, &c., or ceilings to be hereafter fixed without any space, &c., between it and such walls, &c.; and the fixing of such boarding, &c., shall be a work under section 145 of the Act of 1894.

These provisions are salutary ones from other points of view than resistance to fire, *e.g.*, the standpoint of sanitation. The section 145 referred to is one requiring notice to be given to the district surveyor.

---

* See preceding column.

* See preceding column.

Lift Shafts.

Section 20 requires the shaft of every lift, &c., hereafter constructed in a building (except in a dwelling-house occupied, &c., by not more than one family) to be constructed and enclosed to the satisfaction of the district surveyor, to whom in this case notice under section 145 of the Act 1894 is to be given.*

(*a*) The sides of the lift, &c., shaft throughout its height, the bottom, where the shaft does not extend to the foundation of the building, and the top, where similarly not to the roof, are all to be enclosed.

(*b*) Shafts of lifts, &c., within the well hole of any staircase may be enclosed with open metal grilles or guards and open metal doors, but otherwise all materials for enclosing shafts shall be solid fire-resisting materials (other than wood)† not less than 3in. thick. Doorways with fire-resisting doors may be constructed in such shafts.

No lift shall be constructed in, or communicate with, an enclosed staircase in any buildings of the warehouse class.

These provisions seem desirable.

Part 4 deals with Miscellaneous Matters.

Section 21 amends section 76 of the Act of 1894. This section 76 authorizes the Council "on the report of the superintending architect and of the chief officer of the fire brigade that additional cubical extent is necessary for any building to be used for trade or manufacture," and when the Council "are satisfied that proper arrangements have been or will be made and maintained for lessening so far as reasonably practicable danger from fire," to "consent to such building containing additional cubical extent." The building, however, is not to be more than 450,000 cub. ft. in extent, or less, if so allowed by the Council, unless divided by party walls, nor to exceed 60ft. in height, nor be used for a trade, &c., involving the use of explosive or inflammable materials.

The consent is only to continue while the conditions under which it was granted continue.

Section 21 of the new Act extends the Council's power under this section 76 by permitting them in giving any such consent to impose such conditions as they may think fit, and to require the maintenance, &c., to their satisfaction of provisions, &c., for lessening danger from fire, and a petty sessional court may order the owner to comply with such requirements.

This is a useful power, but it would be better vested in the hands of one expert, from whom there should be an appeal to such a tribunal as is mentioned in the third column of the preceding article.

Section 22 empowers an owner to enter buildings notwithstanding special terms of leases, to comply with sections 6, 8, 10, 12 and 21.

Section 23 empowers "any officer of the Council duly authorized by the Council in writing, and for the district surveyor to enter, inspect and examine at all reasonable times any building."

This power is a sweeping though possibly a necessary one. It might well provide for some short notices of entry being given.

Section 24 authorizes the district surveyor to receive fees under schedule 2. As in the Act of 1894, the fees will be based on the area of the whole building in which such work is to be done, and though the matter is indubitably one of some difficulty, a fairer and more uniform scale might be contrived and substituted. The increase of practically 10 per cent., as appears to be the case as regards new buildings, in the amount of the district surveyor's fees for inspection under the Bill is somewhat considerable.

Section 25 provides for the infliction of heavy penalties, not exceeding £21 and £5 daily, upon person contravening—

(*a*) Section 10, &c.

(*b*) Sections 6, 8, 12, and 21, as regards the maintenance, &c., of means of escape.

(*c*) Section 8, as regards change of conditions, &c.

(*d*) Order of petty sessional court under section 21, or refusing "to permit any officer of the Council or any district surveyor to enter, inspect and examine any building" as provided by section 23.

The liability to these penalties is to be without prejudice to any other proceedings, whether under this Act or otherwise, but so that no person shall be punished twice for the same offence.

Section 26 provides that where an offence for which the owner is liable to a penalty has been committed by an occupier or other person, the latter is to be liable to the same penalty as if he were the owner.

Where an owner is charged with any offence he may cause the actual offender to be brought before the court, and, if proper, convicted, when the owner is exempt.

Section 27 provides that where sections 6 and 7 are inconsistent with section 63 of the Act of 1894, the two former shall be deemed to be in substitution for section 63.

Section 28 requires the Council to bear the expenses of the Act.

Taken as a whole, the Bill is one whose general aim and purpose is most commendable and desirable; and if its promoters can see their way to so considerably modify its rigour as to permit it to become law in a much amended condition, it will assuredly be a beneficial enactment. As it stands at present it would destroy commercial confidence as regards new building operations; would involve the abandonment of many existing buildings; would cause to owners of property severe losses and heavy expenses, which would probably in some cases result in financial ruin; and altogether is so arbitrary, drastic and unreasonable that it would be quite an impossible Act.

The Bill was introduced in the House of Commons on Tuesday, February 24th, and read a first time.

Bricks and Mortar.

Aphorism for the Week.

Gothic is now like an old dress, which fitted a man well twenty years back, but must be altered to fit him now.—J. H. NEWMAN (1848).

Our Plates. FYVIE CASTLE, Aberdeenshire, owes its greatest architectural splendour to the Seton family—successors of the Meldrums—in the person of Alexander Seton, Lord Fyvie and Earl of Dunfermline. The great staircase adjoining the Gordon Tower is a fine example of Scottish work, and an admirable specimen of constructive skill. It was built by Lord Fyvie about 1600. The stair occupies a rectangular space with winding steps radiating from a massive stone newel about 1ft. 9in. in diameter. The steps are not generally in single stones, and next the stone newel they have upright mouldings shewing their section on plan—an indication of a late date. The construction of the staircase consists of a series of flat arches thrown between the newel and the outer walls, each successive arch, as the stair ascends, being straight angles to and some steps higher than the preceding one. The square spaces thus formed by these arches are vaulted so as to form the rests for the steps. The main arches spring from the round newel, where they have a wedge-shaped bracket, and on the wall side they rest on moulded imposts, with the Seton crest beneath and under this a shield charged with the Seton arms and those of the Earl's two wives. The stone newel of the great staircase terminates in a kind of carved Gothic finial, with the upper course having sloped sides and carved crockets. The drawing is by Mr. David Thomson, of Perth.—Some particulars of the Sweet Briar Institute, Virginia, are given on p. 35 of this issue.

Glasgow Municipal Buildings. MR. WILLIAM FORREST SALMON F.R.I.B.A., in addressing the students of the Glasgow Schoo of Art, said "art" was the result of man' efforts to attune his works into harmony with nature's works. Alluding to the Glasgow Municipal Buildings, he said the dayligh had to be supplemented by electric light becaught daylight had been sacrificed to the style of architecture chosen. The building was designed on the lines of an Italian palace, and, had it been erected in Italy, the clear atmosphere would have yielded sufficient daylight with the windows as they are. But for our atmosphere it was an unsuitable design. Man had failed by not giving sufficient regard to nature on the ethical o on the æsthetical side.

Restoration of Welbeck Abbey. THE work of restoring th Oxford wing of Welbeck Abbey, which was destroyed by fire about two years ago, has been so far proceeded with that it is expected to be ready fo occupation in the autumn. The external wall have been mostly preserved, while interes has been given to the long south front by two important projections with pediments. Th tiers of iron balconies have been removed On the east front, at the level of the uppe garden, a loggia with stone columns make a bold projection, and serves as a garden porch. The range of pseudo-Gothic gables which were incongruous above the larg sash window, has been removed, while a central feature of rusticated arches, ornamented by a pediment, has been formed. A somewhat similar feature has been designed by the architects, Messrs. Ernest George & Yeates, to form a centre to the west front together with a spacious porch, the latte having a bronze door and rich grilles o bronze. The roof has been covered with copper, and the walls built of the warm Anston stone, a local magnesian limestone On the central projections important group of statuary are being carved by Mr. A. Hodge The Duke of Portland has not, however confined the restoration to that part o Welbeck which suffered by the fire. Th house generally inside has undergone grea changes. With a redisposition of its room improvements have been effected in th corridors and in the lighting. By means o an arcaded screen, the Gothic room, whic once served as a library and later as a dining room, has been thrown into a spacious hal and this is receiving oak panelling 14f high, with a daïs at one end. The new dining-room, with its high-panelled wall and wagon ceiling, has a minstrel's galler at one end, and has been specially scheme to receive the Duke's superb Van Dyck whilst the large drawing-room is bein treated to bring it in harmony with its priceless Boucher tapestries. An important part o the new work is the group of rooms f the Duchess of Portland's own use. Th boudoir at the south-east angle has a coffere ceiling of walnut, with carving and gesso work, the other woodwork also being o walnut, the doors having delicate inlay The doorways and tall chimney-piece a of Istrian stone. The walls are hung wit silk. A feature in the dressing-room an alcove with a sunk marble bath with steps leading down, and marble surroundings.

Obituary.

Mr. A. J. Grice, builder, of Bacton, died last week at the age of forty-five years.

M. Lottin De Laval, the distinguished archeologist, has died in Paris at the age of ninety-hree years. He travelled extensively in Persia, and, as the result of his expeditions, presented the Louvre Museum with an interesting collection of Assyrian bas-reliefs and epigraphs.

Mr. Walter Scott, builder and contractor, of Eden Terrace, Sunderland, died last week at the age of eighty-three years. Mr. Scott had in the course of his long career a considerable experience in the construction of public buildings, and his work included the erection of a good number of churches.

Mr. James Smart, architect, of Perth, died last week at the age of fifty-six years. He was born in Alyth, and in early manhood went to Perth and joined Mr. David Smart, architect. About twenty years ago he started business in Perth on his own account as an architect, and of late years he carried through very successfully many important works in the renovation of various parts of the city. He had a good business both in the city and county of Perth. Mr. Smart was the architect of the Coupar Angus Town Hall and many other buildings. His latest work was the erection of St. John's Middle Parish Church manse in Glasgow Road.

The Death of Mr. Robert Lawson, architect, of Dunedin, New Zealand, is announced. Mr. Lawson, who went to the colony forty years ago, was born near Newburgh. As a youth he was articled as an architect to Mr. Heiton, of Perth, subsequently serving in the offices of Mr. Lessels, of Heriot Row, and Mr. Gillespie Graham, Edinburgh. At the age of twenty-two he determined to try his ortune as a colonist; and first in Victoria, New South Wales, and then in Dunedin, he gained much popularity by his skill as an ecclesiastical architect. In 1864 he secured the £100 first prize in an architectural competition covering Australia and New Zealand for he building of the "First Church," Dunedin. n all he was entrusted with nearly fifty large hurches, besides numerous other public and Government buildings.

Builders' Notes.

Building in Alnwick promises to be unusually brisk this summer.

Messrs. Abbott & Co., St. John's Studio, Chapel Street, Lancaster (London office: 18, Berners Street, W.), have issued a card showing specimens of their leaded-glass work. ome of the designs are very pleasing and the colourings harmonious.

A Form of Model General Conditions recommended by the Institution of Electrical Engineers for use in connection with contracts for plant, mains and apparatus for lectricity works has been published by Messrs. E. and F. N. Spon, Ltd., 125, Strand, London, W.C., price 1s.

French Fire Exhibits.—A deputation from the International Fire Exhibition has interiewed the French Minister of Commerce, the President and other officials of the French Fire ederation, who have been selected as a pecial Committee to ensure a fitting representation of France at the coming exhibition in London.

The Northern Plumbers' Strike. — The plumbers in the shipyards of the North-East oast, who have been on strike since the 9th of October against a reduction of wages 1s. per week, have accepted the employers' fer to allow the matter in dispute to be decided by arbitration. The plumbers will sume work pending the result of the arbitration.

The Blackpool Corporation New Stables are being ventilated by means of a number of patent Ridge ventilators, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A Hill removed as Bricks.—"South African Exports" states that Messrs. Marshall, Sons & Co., Ltd, the well-known engineers of Gainsborough, in making extensive additions to their works, decided to level a small hill in the vicinity, and erect a large boiler shop about 400ft. long upon the site. When the excavation work was begun, it was found that the hill was mostly composed of clay. It was then resolved to make the bricks for the building on the spot. Accordingly, the hill has been gradually converted into bricks, which have been built up round the four sides, so that on the placing of the great glass roof, a portion of the original hill is still left inside the building to provide the last remaining bricks required for its completion.

Coming Events.

Wednesday, March 4.

EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Section).—Mr. James Gillespie on "Some Notes on Towers and Steeples," 8 p.m.

SURVEYORS' AND AUCTIONEERS' CLERKS' PROVIDENT ASSOCIATION.—General Meeting at Auction Mart at 7 p.m.

INSTITUTE OF SANITARY ENGINEERS, LTD.—Special Council Meeting at 7 p.m.

ROYAL ARCHÆOLOGICAL INSTITUTION.—Viscount Dillon on "Armour Notes," 4 p.m.

ARCHÆOLOGICAL ASSOCIATION.—Meeting at 8 p.m.

INSTITUTION OF CIVIL ENGINEERS. — Students' Visit to inspect the widening operations in progress on the London, Brighton and South Coast Railway, between Victoria Station and Clapham Junction, 2.20 p.m.

Thursday, March 5.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Technical Demonstration of Home Drainage, Plumbing, Sanitary Fittings, Heating and Hot Water, Water Mains and Service Pipes, Pumps and Hydraulic Rams, at Mr. William Baird's, 12 Lower Abbey Street, Dublin, 4 p.m.

CHEMICAL SOCIETY.—Meeting at 8 p.m.

GUILDHALL, E.C.—Meeting to oppose the London Building Acts (Amendment) Bill, 12 a.m.

JUNIOR ART WORKERS' GUILD.—Mr Cyril Davenport on "Bookbinding," 8 p.m.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—Mr. R. W. A. Brewer on "The Production by means of Gas Producers and Engines," 8 p.m.

Friday, March 6.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. James Lochhead on "Belgium: Commerce and Architecture," 8 p.m.

ARCHITECTURAL ASSOCIATION.—Messrs. H. B. Creswell and A. W. S. Cross on "Competitions," 7.30 p.m.

JUNIOR INSTITUTION OF ENGINEERS.—Mr. W. T. George on "Practical Notes on the Use and Maintenance of Electric Motors for Factory Purposes," 8 p.m.

ART WORKERS' GUILD.—Lecture on "Carpaccio," 8 p.m.

Saturday, March 7.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE SCIENTIFIC SOCIETY.—Mr. Joseph Menmuir on "Low-Pressure Switch Gear," 7.30 p.m.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Meeting at Carpenters' Hall at 6 p.m.

Monday, March. 9.

SURVEYORS' INSTITUTION. — Ordinary General Meeting at 8 p.m.

A PROFITABLE BUSINESS OF YOUR OWN!

A GENUINE OPPORTUNITY.

Our organization of **AUTOMATIC ADDRESSING BUREAUX,** extending throughout the United Kingdom, offers a splendid opportunity of establishing, in your Town or District, a remarkably profitable business of your own, connected with a co-operative enterprise quite unique in the world. Briefly stated, our proposition is the following:—

If you will establish, in your Town or District, an **ADDRESSING BUREAU,** and agree to organise and conduct same on the lines upon which our own is based, we will grant you a License giving you the right to the use of our name, in addition to other valuable privileges.

Only one License will be granted in each Town or District. There will be no overlapping.

The enterprise is of **FAR-REACHING UTILITY,** and is based on an entirely **NEW BUSINESS** principle.

For full particulars write at once, mentioning this publication and enclosing stamp for reply.

THE
AUTOMATIC ADDRESSING BUREAUX, Ltd.,
19, 20, 21, HIGH HOLBORN, W.C.

3 BEAUTIFUL FRIEZES.

"THE CORNFIELD FRIEZE."

(1) PLOUGHING; (2) HARROWING; (3) MOWING; (4) CARTING; (5) THE PRODUCTS OF THE CORN FIELD. In Five Separate Plates. Total Length, Fourteen Feet Seven Inches by Fifteen Inches deep. A splendid example of Colour Work in Permanent Ink Photo. By M. PAUL ALBERT BAUDOIN. This magnificent Illustration was presented to the Subscribers to "THE ARCHITECT" in 1886. A few proofs were taken, which immediately became out of print.

In consequence of the almost daily demand for these plates, they have been reproduced by Subscription at **Half-a-Guinea the set,** and are now ready for issuing. Subscribers are requested to make immediate application.

"THE HAMILTON FRIEZE."

(1) AN OFFERING TO CERES; (2) THE EDUCATION OF BACCHUS; (3) MINERVA VISITING THE MUSES; (4) JUDGMENT OF MIDAS. By W. HAMILTON, R.A. Size of each plate, Forty Inches by Fifteen Inches. The whole forming a very beautiful Frieze in Bartolozzi Mezzotint. Price per Set, Ten Shillings and Sixpence on Proof Plate. Free by post, carefully packed inside patent roller, Eleven Shillings.

"THE GALLAND FRIEZE."

From the Wall Paintings in the Hôtel de Ville, Paris, by P. V. GALLAND. Eighteen pieces printed in Terra Cotta, with Gold background.

M. Young,* Elm Grove, Hexham ..	1,742	5	0

* Accepted.

Rumney (near Cardiff).—For rebuilding the Cross Inn, Rumney, near Cardiff. Mr. Edward H. Bruton, F.R.I.B.A., architect, 119, Queen Street, Cardiff :—

Lattey & Co.	£1,658	4	8
Fursey & Harris, Castleton	1,619	0	0
Goagh Brothers	1,520	0	0
J. Allan & Son	1,400	0	0
S. Shepton & Son	1,390	0	0
Miles Brothers	1,354	3	5
Williams & Hoare	1,340	0	0
G. Mallett	1,300	0	0
G. Couzens & Co., Riverside Works	1,264	17	6
W. Thomas & Co...	1,249	0	0
A. W. Cadwallader,* Roath	1,190	0	0

* Accepted. [Rest of Cardiff.]

Stonehaven (Scotland).—For the supplying and laying of about 3,400 yds. of 8in and 6in. cast-iron water-pipes, for the Town Council. Mr. George Murdoch, burgh surveyor :—

J. Walker, Leith	£1,948	10	3
W. Mitchell & Sons, Dundee	1,710	17	6
J. Murray, Stonehaven	1,544	15	3
A. McKay, Aberdeen	1,491	7	0
T. S. Dick, Broughty Ferry	1,477	15	6
W. Smith, jun., Stonehaven	1,465	9	9
J. Blaikie & Sons, Aberdeen	1,457	0	0
J. Laing & Sons, Inverarie	1,447	0	0
J. Ross,* 61 Barclay Street, Stonehaven	1,387	15	0

* Accepted.

Swanley (Kent).—For the erection of a police station at Swanley, for the Standing Joint Committee. Mr. F. W. Ruck, county surveyor, Maidstone :—

J. F. Varrell, Belvedere	£4,950	0
T. Knight, Sidcup	4,089	0
Goddard & Sons, Dorking	4,050	0
W. H. Archer, Gravesend	3,797	0
Corben & Co., Maidstone	3,744	0
Ennis Brothers, Erith	3,683	0
H. J. Smith, Maidstone	3,683	0
J. Lonsdale, Swanley	3,650	0
Goodwin & Jeffery, Maidstone	3,646	0
W. Smith & Sons, Croydon	3,598	0
Pearce & Sons, Maidstone	3,590	0
Wallis & Sons, Maidstone	3,572	0
Turner & Co., Walmer	3,500	0
G. H. Deane, Deal	3,495	0
Spencer & Sons, Erith	3,483	0
J. A. Blessington, Dartford	3,444	12
Barden & Head, Maidstone	3,400	0
Richard,* Avard	3,295	0

* Accepted.

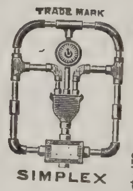
SLATE SLAB GOODS:
Both Plain and Enamelled.
ALFRED CARTER & CO., LIVERPOOL.



Simplex Conduits.
The "Simplex Steel Conduit System" is now recognised by all the leading authorities to be the **best method** of installing Electric Wires. It is now almost **exclusively employed** for all kinds of installation work.
ECONOMY and EFFICIENCY
are secured by the use of Simplex. Do not be satisfied with imitations. Every Conduit and Fitting stamped "Simplex."
We are devoting a big factory and all our energies to the bringing out of one product, and it is owing to this concentration of all our efforts that our system to-day stands in the **very front rank** of wiring systems.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

March 11, 1903. Vol. 17, No. 422.

9, East Harding Street, E.C.

The Entasis. FROM an optical refinement in the days of Pericles the entasis has degenerated into a ludicrous feature on many modern buildings. When we look at a Greek column with its almost imperceptibly curved outline and compare it with that swollen column of which some architects seem so fond, we can hardly credit the sense that has turned a beautiful subtlety into a caricature. *Tenio*, "I stretch," with a vengeance; so that one may even see columns like rainwater butts and pilasters bulged out each side to distraction. Maybe those are the exceptions, but the scores of columns one sees with an entasis exaggerated to an absurd degree make it apparent that the architects who designed them have no proper sense of what they are doing.

Architectural Copyright. THE Society of French Architects is stated to have passed resolutions to the effect that the architect is to have the right of objecting to the reproduction by photography of any building designed by him, and that if the reproduction is put on sale he is to have the right of claiming a royalty on the sale; and, finally, that every copy of the print must bear the architect's name and qualifications. This seems to us to be an unreasonable and impossible proposal. We are quite willing to admit that the architect has an equal right to copyright protection as the artist—as recognized by the French law passed just a year ago—but the drawings of a building and the building itself are two very different things. When the building is erected it is no longer the architect's special property; it becomes public, for good or ill; and as such we fail to see why the architect should be given power to object to any photograph being taken of it, and to demand a royalty on the sale of prints, as suggested by the Society of French Architects; though we heartily agree that the architect's name should appear on every copy—poor man, he is sadly neglected. The proposal is of course one of copyright; and the law of copyright is probably the most involved of all. Here in England one has to copyright the plan of a building as a "book" and the elevation as a "picture." That is troublesome and unsatisfactory enough. What would happen if, before taking a photograph of a group of houses, one had to obtain the permission of all the architects who designed them, is direful to imagine. Yet this presumably would be necessary if the proposal of the French architects became law.

British Standard Sections. THE standardization of British iron and steel sections is one of the most notable trade reforms of recent times. The Engineering Standards Committee has practically finished its labours, and it only remains for the results to be published. The first of these is a pamphlet now before us (issued at one shilling) giving nine lists of different sections. The scope of this seemingly straightforward compilation is enormous. It is the work of two dozen committees and sub-committees composed of the most eminent men in the iron and steel industries of this country, including fourteen representatives from Government Departments. And the result is that within a twelvemonth it is believed British standard sections will be in general use throughout the country, effecting a yearly saving of several millions of pounds—in structural steel alone these sections are calculated to effect a saving of £750,000 a year. The pamphlet already referred to includes equal, unequal and bulb angles, bulb tees and plates, **Z** and **T** bars, channels and beams. The need for standardizing the **H**-beam has long been felt, and it is this section which mostly concerns builders and architects. Thirty sections of it are given—an ample range—varying from 3in. by 1½in. to 24in. by 7½in., and weighing respectively from 4lbs. to 100lbs. per ft. The Committee says that beams ordered to the standard thickness shall be practically accurate in profile; but if the thickness of the web is less or greater than these standards, the width of the section will be decreased or increased by the same amount; and it is suggested that beams be ordered by depth of section, width of flanges, and weight per ft. A table giving the areas of sections in square inches, moments of inertia, &c., is to be issued in due course. As the sale of these lists is intended to supply the much-needed funds for carrying out the work of the Committee, the technical press has been requested not to publish them; and we must therefore recommend our readers to purchase copies either from the publishers (Messrs. William Clowes & Sons, Ltd., 23, Cockspur Street, S.W.) or direct from the offices of the Committee, 28, Victoria Street, London, S.W.

The Tonnere Hospital. IN our issue for January 28th last we gave a description of this remarkable building which the municipality of Tonnere proposed to convert into a covered market, together with a plan of the hospital and a perspective sketch of a portion of the interior as it existed in mediæval times, taken from Viollet-le-Duc's Dictionary of Architecture in France. It is gratifying to learn that a movement has been set on foot for the preservation of this almost unique relic of the Middle Ages, mainly through the exertions of Dr. Chaput, an enlightened medical practitioner of Tonnere, and a subscription list has been opened for the purpose of raising the necessary funds for the repair of the roof, for which a sum of from £800 to £1,200 will be required. The hospital is classed as an historical building and is under the control of the Commission for Historical Monuments, who in view of the protests of the inhabitants of Tonnere have refused their consent to the proposed conversion of the hospital. The Commission have not sufficient funds to defray the entire cost of the necessary repairs to the roof-timbers, but will contribute to the cost provided a substantial sum is subscribed by the public. The subscription list is under the patronage of M. Amayat and M. Léger of the Institute, and other distinguished names, and M. Ch. Normand, the president of the Society of Parisian Monuments, has given valuable assistance. The hall of the hospital is almost entirely paved with flat grave-stones, interments having taken place up to the sixteenth century notwithstanding the presence of the patients, and in the seventeenth and eighteenth centuries it is computed that at least a thousand persons were buried in the hall.

Royal Academy Exhibition. THE receiving day for architectural works at this year's Royal Academy Exhibition is Friday, March 27th. We shall be pleased, as in previous years, to receive drawings from intending exhibitors, and undertake to deliver them at Burlington House free of charge; but they must reach us at latest by noon on the day mentioned. It is very desirable that they should be sent as early as possible so that there may be ample time for photographic reproductions to be made of them. The name and address of the sender should of course be put on the back of every drawing and a label attached to the frame with a string.

BALZAC'S HOUSE.

WITH reference to the note on p. 17 of THE BUILDERS' JOURNAL for February 25th on Honoré de Balzac's house at Ville d'Avray, near Sèvres, a correspondent points out that the suggestion that the architect forgot the staircase, and that the latter had to be added after the house was finished, has no foundation in fact, but is a joke at the expense of architects which has been related of several other buildings in this country and abroad.

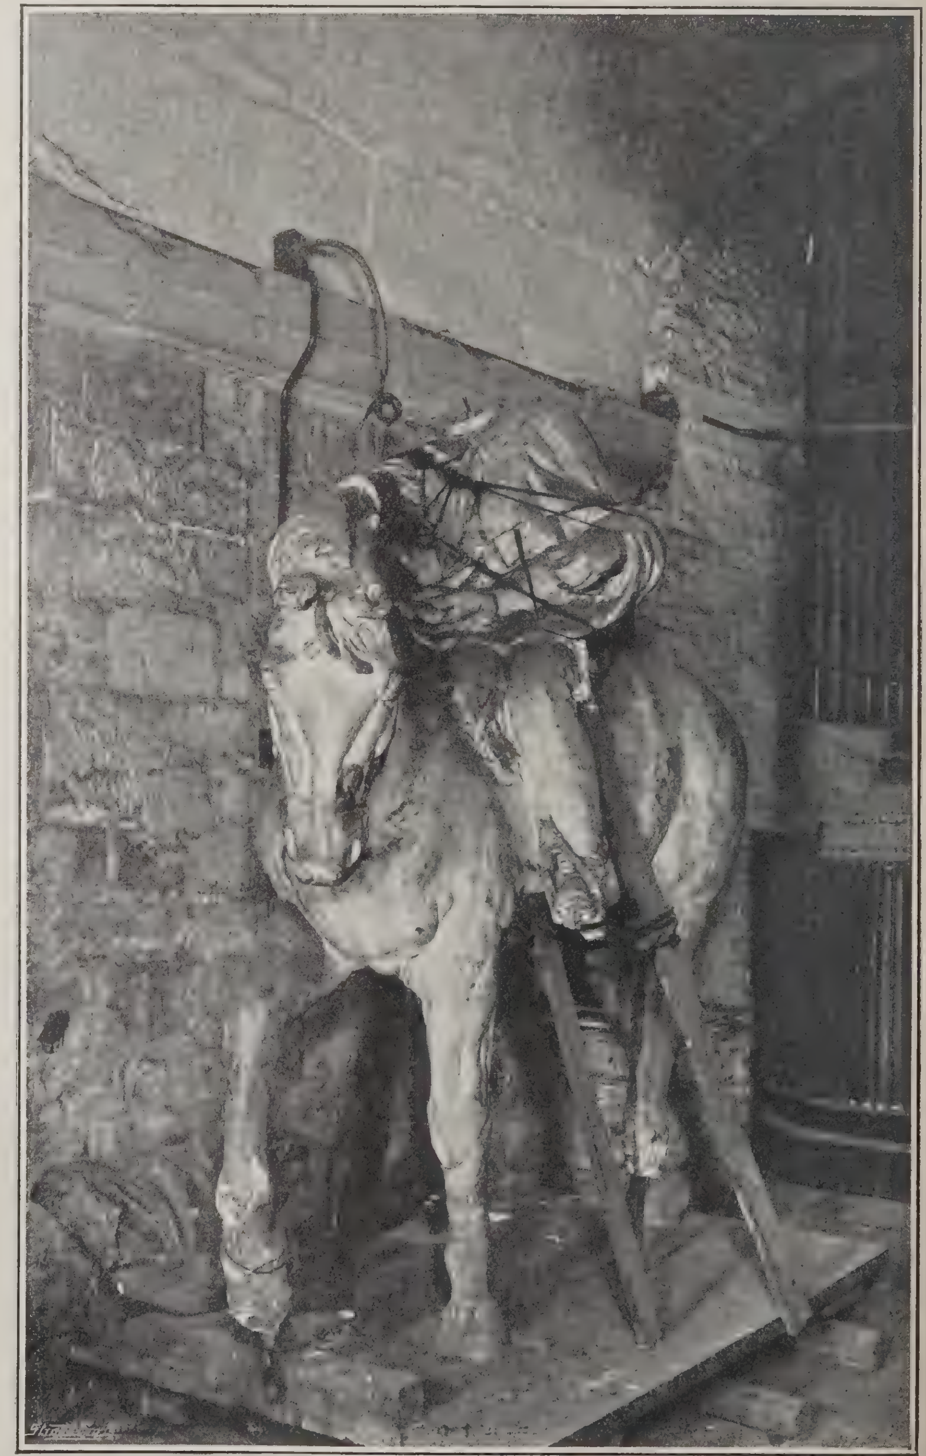
When the present Lyceum Theatre was built, in 1834, it was found necessary to construct a temporary staircase to the gallery, the requisite ground for the permanent staircase not having been obtained at the time fixed for opening the theatre, and this led to a report, which was repeated in several places, that the architect had forgotten the staircase. The architect, Mr. Samuel Beazley (1786-1851), a man of great experience in building theatres, contradicted this report in a letter to the "Times," in which he explained the circumstances which led to the construction of the temporary staircase to the gallery; but notwithstanding this contradiction, the silly tale is still repeated, and a few days ago "Public Opinion" in an article on the Lyceum Theatre revived this ancient canard. When it is stated that Beazley, in addition to the Lyceum Theatre, built the City of London Theatre, Norton Folgate, the St. James's Theatre (for Braham the singer), the Adelphi Theatre, and prepared drawings for two theatres in Dublin, two in Belgium and one in Brazil, it will be seen how impossible it was for such an oversight as the omission of a staircase to an important part of the auditorium to have occurred.

The facts with regard to the building of Balzac's house, Les Jardies, at Ville d'Avray, are related by Balzac's friend Léon Gozlan, in Balzac *en pantoufles*, and are to this effect: "It has been reported that while directing himself the building of the pavilion at Jardies, with a despotism that never relaxed, he forgot the staircase. That he would not permit any suggestion, observation or criticism from his architect or his builder's men is one fact to which we can bear witness; but that he should have neglected to provide a staircase in planning the house, and that one fine day builders and architects should have rushed up to him exclaiming, 'M. Balzac, the house is finished; when shall we build the staircase?' is a second fact which demands an explanation in proportion to its importance. Balzac contemplated for his Jardies spacious rectangular rooms, lighted from the four sides of the building. Now, in the architect's design the Minotaur-like staircase swallowed up here the third part of one room, there the half of another; it disfigured the design created by the author's poetic pencil. An attempt was made to reduce its size, to turn it round, to relegate it to the angles of the building, the building being unhappily too cramped to afford any spare room; the confounded staircase spoiled everything. The bricklayers threw their mortar into the air, the architect broke the legs of his dividers. It must have been during one of the struggles with the difficulties of this problem that Balzac said, 'Since the staircase means to master me, I will get rid of it.' This was done. The rooms then rose without obstacle, without any other limitation than the four external walls, and the enclosing walls of the staircase were built as an after-thought in front of the house as a punishment for its tiresome pretensions. Balzac might have excused himself, seeing that in Holland and in Belgium (and it might be added in England) whole cities are built on this simple plan, the houses carrying their staircases on their backs like a basket; he always declined to explain himself on this point."

In a letter to the Countess Hanska, the Russian lady he afterwards married, Balzac thus describes his house:—

"The house itself is like a parrot's cage, one room on each storey, of which there are three. On the ground floor there is a dining-room, on the first-floor a bedroom and dressing-room, and above that is my workroom, in which I am at this moment writing to you at midnight. The whole is flanked by a staircase which much resembles a ladder. All the way round on the first floor is a gallery, supported on brick piers, where one can walk and shelter. This little Italian pavilion is painted brick colour, with stone quoins at the angles. The addition containing the staircase is painted with red and white stripes like bed-ticking. There is only one room here for me About twenty yards from the house towards the park of St. Cloud are the offices, consisting of a kitchen, scullery and larder, with a stable and coach-house, bathroom and wood store. On the first floor is a large apartment, which I can let if I please; on the second floor are the servants' rooms and a room for a friend. I have a spring of water equal to the celebrated spring of Ville d'Avray; it comes from the same source, and a wall encloses the whole of my property."

Alfred Stevens's Plaster Model of the Duke of Wellington is shown below as it stood in the vaults of St. Paul's Cathedral. At the sale of the great sculptor's effects it became the possession of Mr. Hugh Stannus, F.R.I.B.A., who removed the head for safety's sake. This is the model which was purchased by the private committee who commissioned Mr. John Tweed to complete the work for the memorial in St. Paul's Cathedral: and it is now in Mr. Tweed's studio at Chelsea.



ALFRED STEVENS'S ORIGINAL PLASTER MODEL FOR THE WELLINGTON MEMORIAL, AS IT STOOD IN THE VAULTS OF ST. PAUL'S CATHEDRAL.

Views and Reviews.

A Fine Alphabet.

This alphabet of Roman capitals has been carefully enlarged from the inscription on the Trajan Column at Rome, of which the author observes in a note that it is, on the whole, "the finest in character and proportion of any Roman letters available." We do not much care, however, for the "M," "N," "R" and "S." The letters not appearing on the inscription, H, J, K, U, W, Y, Z, have been drawn from the best existing material; the character of the Trajan letters being kept as near as possible. Perhaps the "J" is the least satisfactory of the new letters. Squaring is given, together with diagonal lines showing the thickest and thinnest parts of the round letters. The first set of lower-case letters is made of the semi-uncial forms of the seventh, eighth and ninth centuries, preserving uniformity as far as possible, while avoiding too great a similarity to the other sets. The second lower-case set is Roman, carefully enlarged from photographs made for William Morris from the Italian type of Nicolas Jensen, fifteenth century. The third is Italian round-hand black letter, enlarged from choir books of the sixteenth century in the National Art Library, Victoria and Albert Museum.

The alphabet is admirably printed on strong drawing-paper, each capital being 7in. square, with the lower-case letters below, and the whole enclosed in a wrapper-envelope. We must compliment the artist and the publisher on their production, which should be in the hands of every architectural student.

"An Alphabet of Roman Capitals, together with three sets of lower-case letters," by G. Woolliscroft Rhead, R.E., Hon. A.R.C.A. Lond. London; B. T. Batsford, 94 High Holborn, W.C., price 2s. 6d. nett.

Shakespeare's Town.

Mr. Baker in opening his volume does well to point out that Stratford itself is full of charm and beauty, and though inseparably connected with the great English poet and dramatist, is by no means dependent on this fact for its interest. Our recollections of the place are very pleasant ones, and the excellent illustrations bring back to mind many exquisite bits we remember to have seen in this gem of the Midlands. The view from the top of the Memorial Tower, if one takes the trouble to climb the stairs, gives a magnificent panorama of inviting and restful scenery. The town, too, gives one a curious sense of completeness. It has its aim and object—its industry, one might say—the exploitation of its greatest son. To that end everything is subordinated. You proceed from point to point of interest, always meeting custodians with books of sixpenny tickets which admit you to the objects of their charge. Everywhere volumes of capacious gape are placed to secure the signatures of the friends who might otherwise write on sacred walls. There is no hurry and no importunity, except from cabmen; only Americans could charter char-a-bancs in such a place. The real charm of the town comes only to the wanderer, who, having exhausted the established formularies of the place, saunters into New Place Garden under the shady trees, or down to the Memorial Garden to watch the rippled river and the Yankee steam launch carrying its human freight beyond the bridges.

The purpose of this excellent guide is, however, to show the points of interest, and this it does "excellent well." Short notes on Charlecote House, the home of the Lucys, and Clopton House, with illustrations, are included at the end of the book.

"The Collegiate Church of Stratford-on-Avon, and other Buildings of Interest in the Town and Neighbourhood." By Harold Baker. Cathedral Series. London: George Bell & Sons, Tavistock Street, Covent Garden, price 1s. 6d. nett.

Mont St. Michel.

There is nothing in this book about the collection of old watch-cocks, the guns and swords, or the wonderful wax figures in their cells at Mont St. Michel, nor a word about the prisoner-sculptor Gaultier or Bertrand du Guesclin and his wife Tiphaine de Raguenel. The author knows well that information about these matters can be had in any of the guide-books. Instead, he has devoted himself entirely to the architectural history of the Mount, and his handbook is an admirable one for all students. Mr. Massé has avoided the catalogue of the dull archæologist, and gives only so much of the dry bones of the Mount's history as is essential to a proper understanding of the many changes through which it has passed: changes monastic and national, and, alas, the irrevocable destruction of the restorer. Indeed the story of the buildings is largely one of fire, wreck and restoration. On such an exposed and isolated site, and with an inflammable town at the base of the rock, the damage caused by wind, weather and fire is not surprising, but the havoc of the restorationist might well have been spared us. The nave of the abbey-church, Mr. Massé observes, has been so mutilated by man, and so defaced and scarred by accidental fires, that a total reconstruction has been recommended and will shortly be taken in hand. "The word 'restoration' is dear to the French architect to-day, and on the whole, when he restores, he does it thoroughly, and, from his point of view, thoroughly well." Viollet-le-Duc and M. Corroyer have been responsible for much of the new work, and latterly M. Petitgrand has had charge of the "restorations." Exterior repair is absolutely necessary, but the architects go beyond that and sweep away the irreplacable work of past ages.

Students will find this book an excellent one, dealing first with the general history of the Mount and then with the individual buildings—the abbey and its precincts, the Merveille (the new glazed tiles on the cloister of which we quite agree with the author are very discordant), the substructures—the Crypte de l'Aquilon, Crypte des Gros Piliers, Promenoir, &c.—the ramparts and the town. The book is well illustrated from photographs, and includes three plans showing the relative positions of the buildings on the three levels of the Mount.

"The Abbey and Town of Mont S. Michel," by H. J. L. J. Massé, M.A. London: G. Bell & Sons, Covent Garden, price 2s. 6d. nett.

SANITARY INSTITUTE.

Health Exhibition at Bradford.

FROM Tuesday, July 7th, to Saturday, July 25th next a health exhibition will be held at the Bellevue Volunteer Barracks, Manningham Lane, Bradford, in connection with the twenty-first autumn congress of the Sanitary Institute. The exhibits will be classified under four divisions, A, B, C and D, subdivided into classes and sections. A will deal with science in relation to hygiene; B with hygiene of special classes, trades and professions (schools, hospitals, &c.); C with construction and sanitary apparatus (class I. relating to building materials, construction and machinery, class II. dealing with water-supply and sewerage, and class III. with heating, lighting and ventilating); and the last division, D, with personal and domestic hygiene.

The principal boroughs throughout the kingdom have been invited to send delegates to the meeting, in addition to the members and ordinary visitors, so that the exhibits will be brought under the notice of members of corporations and officials from all parts of the country. (The number of delegates and members attending the Congress is usually about 2,000.)

Applications for space must be made on the official form and under the proper class, and sent to the offices of the Institute, Margaret Street, London, W., not later than Tuesday, June 9th, but it is advisable that much earlier application should be made. The scale of charge for floor-space will be 15s. per ft. frontage, with a depth of 6ft. Corners and special spaces will be charged at higher rates: wall-space, 1s. per sq. ft. No floor-space will be allotted for less than 3ft. frontage, or wall-space for less than 5 sq. ft. All charges must be paid at the time of allotment. Silver and bronze medals will be awarded at the discretion of the judges, and their decisions will in all cases be final. A complete classified and illustrated list of exhibits, to which awards have been given by the Institute, is published by the Institute. A special medal will be awarded for household sanitary appliances in case of pre-eminent merit, which will be called the "Rogers Field Medal." Protection in accordance with the Patents, Designs and Trade Marks Act, 1883, will be obtained from the Board of Trade for persons desirous of exhibiting new inventions.

Former congresses of the Institute have been held at the following towns:—

Leamington, 1877.
Stafford, 1878.
Croydon, 1879.
Exeter, 1880.
Newcastle-upon-Tyne, 1882 and 1896.
Glasgow, 1883.
Dublin, 1884.
Leicester, 1885.
York, 1886.
Bolton, 1887.
Worcester, 1889.
Brighton, 1890.
Portsmouth, 1892.
Liverpool, 1894.
Leeds, 1897.
Birmingham, 1898.
Southampton, 1899.
Paris, 1900.
Manchester, 1902.

THE FIRE EXHIBITION.

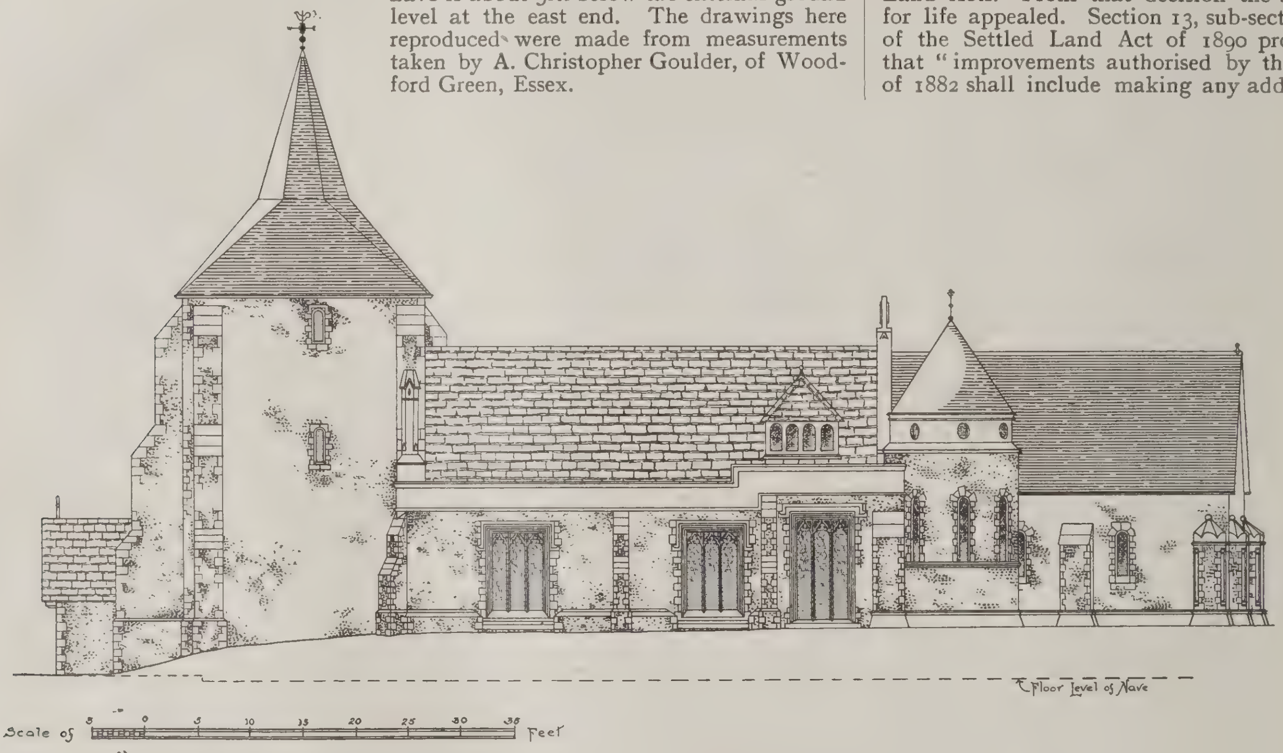
RAPID progress is now being made with the arrangements for the International Fire Exhibition at Earl's Court, and a series of meetings are being held by the various committees in charge of different sections. Among the numerous British exhibitors, apart from the fire-appliance trade, which will be strongly represented by firms like Messrs. Shand Mason and Messrs. Merryweather, the firms interested in the constructional and electrical side of fire-prevention will play an important part. Thus, arrangements have been made for large floor-exhibits by Stuart's Granolithic Stone Co., the New Expanded Metal Co., the Columbian Fireproofing Co., and other firms of that character. Partitions will be shown by Messrs. King & Co. and similar makers. The constructional firms are represented by Messrs. Drew-Bear Perks & Co., the St. Pancras Iron Works, &c., whilst the electrical side has among its representatives the General Electric Co., the Siemens Electrical Appliances Co., Messrs. Pearsons' Fire-Alarm System and Messrs. Oatway's Alarm System. Side-issues are represented among others by Messrs. Millars' Karri and Jarrah Forests for timber constructional work, and the Ratner Safe Co. for fire-resisting doors, safes, &c. As is the case with British firms, so with Continental firms. It is anticipated that there will be a very considerable representation from Germany, France and America. Germany, in particular, is arranging a series of important exhibits in the Ducal Hall. The awarding of prizes in connection with the exhibition will be arranged with greater care than is usually the case with exhibitions. It has been recently announced by the Society of Arts that they have decided to offer Society of Arts gold medals, and other medals, for certain classes of modern fire-extinguishing and life-saving appliances shown at the exhibition. The actual prizes offered are one gold, two silver and two bronze medals for the best chemical fire-engine, and similar medals for the most easily worked long ladder of 80ft.

MICKLEHAM CHURCH.

THIS interesting little church is situated on the main Worthing road in the vicinity of Box Hill. It has undergone considerable alterations at various times, but the remains of the Norman church are still worth attention. The entrance doorway below the west tower and the chancel arch are the most interesting portions of the building, the latter being ornamented with the "zig-zag" side by side with the "dog-tooth" ornament. In 1823 galleries had to be erected on either side of the nave, and as the height of the arcade was insufficient to permit this to be done the Norman columns and arches were removed. In their place square piers of brick and stucco were erected having plaster enrichment similar to that on the existing chancel arch. In 1891 the church was restored to the original design, the galleries were removed, and the round tower on the south side erected for the reception of a new organ. On the north side of the church is the family pew or chapel of the owners of Norbury Park, which contains a fine fifteenth-century tomb to the Wyddolkson family, as well as a window of the same period. The west tower dates from the eleventh century, and is built of rubble work with freestone quoins, the heavy buttresses of which are a later addition and have been recently restored. It contains three bells bearing the respective dates 1610, 1624 and 1850, the last having been re-cast at that date from the old bell. It will be noted from the plan that the chancel and nave are not in the same straight line, the angle of inclination being about 5 degs., and owing to the slope of the site the floor-level of the nave is about 5ft. below the external ground level at the east end. The drawings here reproduced were made from measurements taken by A. Christopher Goulder, of Woodford Green, Essex.

Law Cases.

What Constitutes an "Addition" to a House.—*In re Blagrave's Settled Estates* recently came before the Court of Appeal. This was a case of considerable importance to owners of landed estates. Mr. H. B. Blagrave, tenant for life of the Calcot Park and other estates in the county of Berks, took out a summons asking that £1,307 10s. 2d. might be allowed to him for expenses incurred in providing an electric-light installation, including an engine or dynamo house, for the mansion house of Calcot Park. Mr. Justice Joyce allowed the cost of the engine or dynamo house, which stood at some distance from the mansion house, but held that electric-lighting plant was not an "improvement" for which expenditure out of capital moneys could be allowed under the Settled Land Acts. From that decision the tenant for life appealed. Section 13, sub-section 2, of the Settled Land Act of 1890 provides that "improvements authorised by the Act of 1882 shall include making any additions



SOUTH ELEVATION

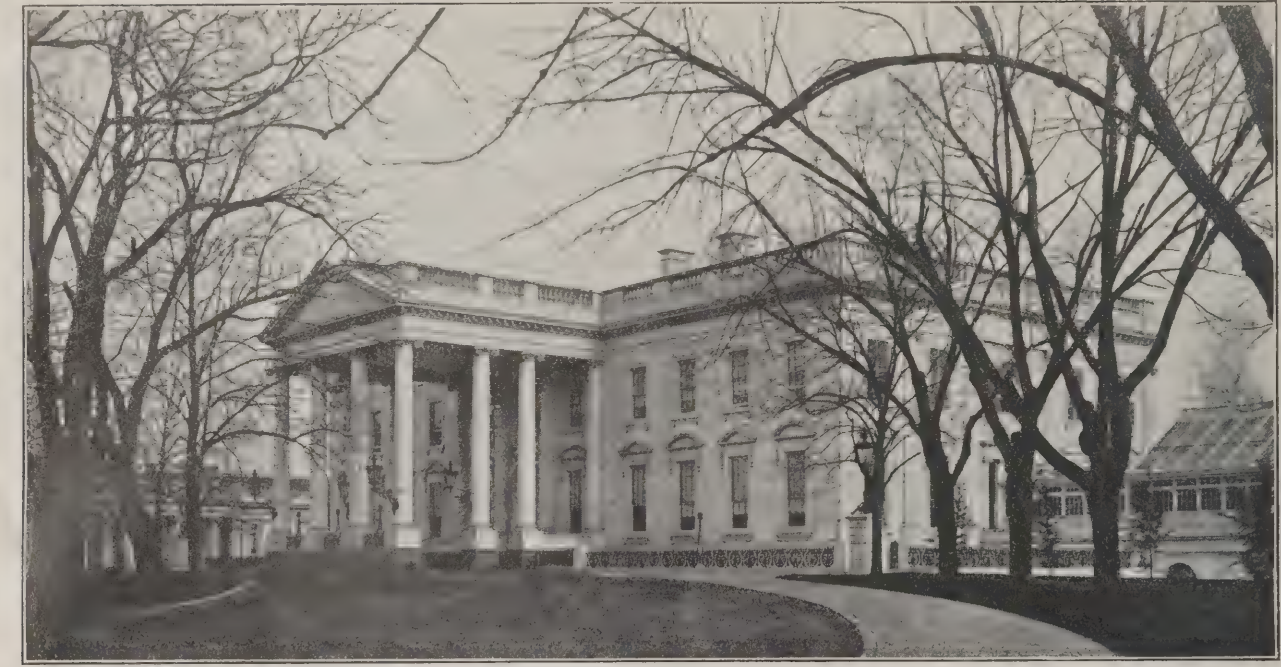
to or alterations in buildings reasonably necessary or proper to enable the same to be let."—The Court of Appeal dismissed the case.—The Master of the Rolls said it was difficult to see how an "addition" could be said to be within the Act which was not structural. Putting down wires in a house or putting an engine in an engine-house his Lordship could not think was an "addition."—Lord Justice Romer thought that when the Legislature spoke of "additions to or alterations in buildings" it referred to something in the nature of a building. That being so, his Lordship thought that even if a dynamo-house came within the sub-section, it could not be said that the installation of electric lighting also came within it.—Lord Justice Cozens-Hardy agreed. He also doubted whether the expenditure on a dynamo-house could be a building within section 13, sub-section 2, of the Act of 1890.

Underground Kitchens: Case under the L.B.A.—At the Marylebone Police Court recently the secretary of the Express Dairy Co., Ltd., was summoned by Frederick Hammond, district surveyor for Hampstead, for failing to comply with a notice of irregularity in respect to the company's new premises at No. 1, Central Parade, West End Lane. The notice of the surveyor had reference to a cellar or store-room on the ground floor of the premises, which, it was said, had been converted by the company into a kitchen or servery, contrary to the London Building Act, which required that every "habitable room" should be 8ft. 6in. in height and have one or more windows opening directly to the external air. This room, which was used for preparing and cooking food, &c., was only 6ft. 3in. high, and, according to the surveyor, when he first visited it had little or no ventilation and was a disgrace to the company. A window was afterwards put in, but still the room was not fit for the purpose for which it was used.—In defence it was urged that the apartment was not a "living-room" but a scullery.—Mr. Plowden, the magistrate, held that the room was a habitable or living-room and made an order for the company to comply with the notice, granting the surveyor £5 5s. costs.

Pulling up the Roads.—On Thursday last the Charing Cross and Strand Electricity Supply Corporation was summoned to Bow Street Police Court by the Westminster City Council for making an excavation at the corner of Garrick Street and St. Martin's Lane, for the purpose of putting down a distributing-box 25ft. square in place of one measuring only 10½ft., without first giving notice to the Council. An emergency notice was sent after the work had been commenced. The work was in progress about a fortnight, and during that time there could, in consequence of the obstruction, be only one line of traffic. The Council wanted to show that the defendant corporation could not disregard the legal restrictions.—For the defence it was submitted that no offence had been committed, as the work done was a work of emergency. It was not a new work, but a renewal or amendment of an old one, and twenty-eight days' notice was not necessary.—The magistrate said he did not agree with that, and fined the defendant corporation 20s. and £2 2s. costs. He expressed his willingness to state a case.



THE WHITE HOUSE WASHINGTON.

THE REMODELLED WHITE HOUSE.

THERE has lately been completed a reconstruction of the Presidential mansion at Washington which ranks as the most important and most extensive project of the kind undertaken since the erection of the historic structure. But the present remodelling, although the most extensive, is by no means the first reconstruction which the famous building has undergone. Following the attempted destruction of the White House by the British troops in 1814, the mansion was restored under the direction of Hoban, the architect of the original structure, which work was completed in 1817. In 1823 the south portico, as at present constituted, was added, and in 1829 was constructed the grand portico and *porte cochère* of Ionic columns which has since constituted the most distinctive feature of the north front of the building.

On the exterior the chief portion of the alterations just completed is the restoration of the long colonnaded wing on the east side of the building, which was removed during the administration of President Johnson or earlier. The entire present project has had as its aim a return to the original plans of the Presidential mansion. The generic scheme of the White House was selected by George Washington in conference with James Hoban, the architect, and they were frequently in consultation with Jefferson. The declaration has frequently been made that the original structure was modelled after Leinster Castle in Dublin, but the architects who went to Dublin to inspect the structure in question before undertaking the present restoration of the Executive Mansion assert that there is no foundation whatever for the claim. Both buildings are in Italian Renaissance, but the White House is far the finer example of the two; indeed, it may be noted in passing that the best American architectural critics are almost unanimous in the opinion that the White House remains to-day the best residence house in its exterior lines to be found in the United States. Others more recently erected represent far greater expenditure, but none compare with the Presidential home in beauty and refinement.

The White House is peculiarly Virginian in its genesis; not only does the design in its relation to the Potomac water front conform to the Virginia customs prevailing at the time of its erection, but the impress of the ideas of Thomas Jefferson upon the structure is rendered readily apparent by the similarity of the design to that of Monticello—the Jefferson homestead—where basement wings, or terraces, extend from the main portion of the mansion house. The White House originally had projections of the same type, and while the wing on the west side in the course of time became concealed by a conservatory on top and was so cloaked on the south front by propagating gardens as to lose its distinctive character, the terrace on the east side was removed altogether, as already mentioned, during the administration of Buchanan or Johnson. To restore these terrace wings has been one of the principal objects of the present reconstruction.

The new terraces are one-storey brick structures which extend out on the ground level, both east and west, and form a part of the basement. The top of the terraces is absolutely flat, and on substantially the same level as the first floor of the White House. They have on each side a parapet wall, about 2ft. 6in., and are adorned with potted trees and box shrubbery, thus affording a beautiful vista of green extending 250ft. in each direction from the centre of the White House. The treatment of these esplanades was suggested by similar work at Versailles, which in turn is possibly a partial copy of the colonnaded walks common in the architecture of Rome.

With the restoration of the terraces, or wings, the south side of the White House, facing the Potomac, becomes, as was originally intended, the front of the building, and what has hitherto been termed the basement is transformed into the first floor. The utilization of this former basement constitutes one of the most notable achievements of the present project.

The main floor of the mansion is approached from below by a beautiful stone stairway 12ft. wide. Niches in the side walls hold electric-light standards. A similar stairway directly over this one, with equally gentle lifts and broad treads, connects the main and upper floors of the house. A commodious elevator has also been installed.

The keynote to the interior architecture of the remodelled building is found in the restoration of the great Colonial hall, opening from the north entrance, which in the past constituted the only means of access to the building, but which will in the future be reserved for the use of the Presidential household and personal friends. The stained-glass screen, which was erected by President Arthur in order to separate the entrance-hall from the main corridor, has been removed and a Pompeian effect imparted by the substitution of six white pillars. The floor is of marble and the walls and ceiling in white in simple, yet classical, treatment. The judicious arrangement of mirrors reaching from floor to ceiling tends to accentuate the evident spaciousness of the apartment.

The main floor of the White House has not been changed as much as might appear from a casual inspection, and, with the exception of the removal of the glass screen, the only essential partition change is that by which the State dining-room is enlarged by the absorption of the space which formerly constituted the westerly end of the main corridor and that occupied by a stairway leading to the floor above.

On the upper floor of the mansion the space formerly occupied by the executive offices has been utilized for sleeping-rooms, and six tiled-baths have been provided. The attic, which was formerly used only for storage purposes, now contains several bedrooms for servants, a bathroom, storerooms and a linen-room. Much work has also been performed which is not apparent to the casual observer, as for instance a great amount of labour has been expended in rendering absolutely secure the foundations and underpinnings of the White House, which are frequently subjected to excessive strain, and 175,000 new bricks have been placed in position under the reception-rooms, in addition to the steel joists and girders. The handling of the immense crowds which frequently assemble at the White House will be greatly facilitated by the new arrangement of the mansion, and particularly by the provision of four separate entrances instead of the single doorway, which was formerly obliged to answer all purposes.—(Extracts from an article in the "Scientific American: Building Edition.")

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Chemical Terms.

St. Leonards-on-Sea.—Studious writes: "Is there a book published dealing with correct definitions of chemical terms, &c.?"

See the article on "The Chemistry and Physics of Building Materials" in "Specification, No. 6." Almost every chemical term is defined in Watts's "Dictionary of Chemistry" (Macmillan & Co., Ltd., 4 vols.). A good elementary book on chemistry is Reynolds's "Experimental Chemistry for Junior Students," 4 vols. (Longmans, Green & Co.). To read Watts's "Dictionary of Chemistry" you need an expert knowledge of chemistry, and if you require to study the subject fully from the beginning, and at the same time have a very complete book, then Roscoe & Schorlemmer's great treatise is the best. It is published by Macmillan & Co., Ltd., in 3 volumes, consisting of 8 parts.

Claim by Executors for Interference with Light.

Enquirer writes: "A few years ago my client built a cottage, using the pine-end of an adjoining one, at the same time extending the backyard of the building beyond the building line of the adjoining property. The sum of £10 has been paid for the use of the pine-end, and the plans, &c., were approved (before building operations were commenced) by the adjoining owner, who died a few months ago. The executors of his will, through their solicitor, now claim damages for interfering with their light, in consequence of our building line having been extended beyond theirs. My client sold the property about twelve months ago, but their solicitor says that they can claim under some new Act. Shall I be right in advising my client to resist the claim?"

If the adjoining owner approved the plans which are now being carried out, his representatives cannot repudiate his agreement. If, however, the extension which causes the alleged interference with light, &c., was an addition to the plans as approved by the adjoining owner, then it stands on a different basis, and must be considered in connection with the Statute of Limitations and the Common Law. No data are given which enable me to pass an opinion on your rights under the Statute and Common Law. But, generally speaking, in the absence of prescriptive rights or statutable prohibitions, you can do as you please with your own land. W. JOHNSON-ROBERTS.

Measured Drawings of Eton College.

London, N.W.—F. C. writes: "Are there any measured drawings published of Eton College—more especially the chapel and the great gateway on the east of the quadrangle?"

Exhaustive enquiries have failed to discover any such measured drawings.

G. A. T. M.

Stephenson's "Estimating."

Stourbridge.—O. S. writes: "A customer of mine asked me to order Stephenson's book on 'Measurement of Dilapidations.' I am informed that no such book is known. Is this so?"

There is no such book by Stephenson on the measurement of dilapidations. Your customer evidently meant Stephenson's "Estimating" published at 6s. 6d. Apply to Mr. B. T. Batsford, 94, High Holborn, W.C.

Right to Remove Doors and Windows.

Netherfield.—J. C. writes: "I have given notice to a weekly tenant, but cannot get him to quit. Is it legal for me to send a man to remove the doors or windows or otherwise render the house inhabitable? The house is in a filthy condition and badly in need of repair?"

Certainly not without an order from a magistrate. It would be best to consult a solicitor—and it would have been better still to have done so without incurring the delay necessarily attaching to an appeal to a weekly paper, which after all is not a legal paper either. G. A. T. M.

Size of Flue and Boiler Setting.

Ramsbottom.—A. C. writes: "What should be the size of a flue from the furnaces of a single plate? Two furnaces would enter the same flue. Also, to what height should it be carried? The surrounding buildings are only about 16ft. to 20ft. to the eaves, and the country around is flat. How are 'kiers' or bleaching boilers set? Is there any technical book dealing with the subject?"

The flue from the furnaces of single plate should be ⅕ area of furnace grates, the chimney ½ area of main flue. The height may be about 30ft. unless there is any local by-law to the contrary. Kiers are sometimes hung from the sides and set with what is called a flash flue, *i.e.*, straight from furnace to chimney. Information on setting boilers may be obtained from Wilson's "Steam Boilers" (Crosby, Lockwood & Co., 7, Stationers' Hall Court, London. E.C., 6s.).

HENRY ADAMS.

Overhanging Walls.

Netherfield.—J. C. writes: "The roof over a hay loft (13ft. span and 30ft. long, collar-braced—the ceiling joists acting as collars, but no plaster ceiling) has thrust the front 9in. brick wall out 3in. to 4in. from floor to wall-plate (above 6ft. 6in.). What is the simplest plan to get the wall back into position and also to strengthen the roof?"

If the roof is arranged with ceiling joists holding the feet of the rafters it can exert no thrust, and there must be some other cause for the wall overhanging as described. The cause may be poor mortar which has perished on the face of the wall. Probably four ½in. tie-bolts, with ⅝in. ends and nuts, would be the cheapest way of preventing the wall from going further and might bring it back a little if screwed up alternately.

HENRY ADAMS.

Preserving Woodwork of Dye-House Roofs.

Ramsbottom.—A. C. writes: "What are the best preventatives of decay in woodwork for dye-house and bleach-house roofs, colour-shop roof, and for woodwork in rooms where acid fumes are given off?"

Creosoting is the best preventative of decay in timber, but the smell is objectionable in buildings. A more recent and probably suitable process for interior timbering is Haskinizing. It consists in placing raw wood in a cylindrical treating chamber, made of boiler plate, of any size, or numbers of them placed together, according to the output required, and submitting the same for a few hours to a medium of superheated, circulating, compressed air, which effects a chemical change. The air-pressure employed (200 lbs. per sq. in.) prevents evaporation while the intense heat (300 degs. to 400 degs. Fahr.) passes through to the centre of the timber, causing the constituents to organize into an oleaginous compound, saturating the fibre and filling the pores. In cooling down, under the same pressure, the new compound becomes consolidated with the fibre, thus indurating, strengthening, perfecting, beautifying, and preserving the wood from decay. The germinative principle inherent in the sap is destroyed, all fungi, germs or insect life are killed, and no offensive odour is emitted from the wood after treatment. Briefly, it may be termed an internal autogenic dry creosoting.

HENRY ADAMS.

Overlooked Premises.

Leeds.—Subscriber writes: "My client owns a plot of ground originally bought as building land, but at present used as garden. The owner of the adjoining plot is now building a house within a few feet of his boundary and *set back* about 15ft. behind the proper building line, having all its main windows (evidently purposely) overlooking my client's garden. My client proposes to build about 10ft. from his boundary, but owing to the size of his land he is obliged to adhere to the original building line, 15ft. in front of the overlooking house. The local authority approve the plans I have drawn and also his block plan; he does not, however, wish to commence building until the autumn. By waiting till then will he have given 'tacit consent' to his neighbour?"

Your client has the whip hand of his neighbour entirely, as "tacit consent" cannot be construed until the windows have been left in enjoyment of their light for nineteen years and a day—until, that is, they become ancient lights. In a well-known similar instance in the south of London, the person in the position which your client now occupies erected a buttressed boundary wall, entirely on his own property, and to the height of his neighbour's eaves, of rough brick burrs. It is now covered with creepers and a decidedly pretty feature at the end of the garden. Possibly your client might like to do the same, or might waive his right to go to an unlimited height for an annual payment on a proper agreement which would retain his right to build up to his boundary at any future time. G. A. T. M.

Buildings Around Nottingham.

Nottingham.—C. B. T. writes: "Being new to this district, I should be glad to know of any buildings in the vicinity worth sketching or measuring."

Nottingham County is extremely rich in architectural remains of great interest, suitable for sketching and measuring. In Nottingham itself there are the church of St. Mary and the Castle. In the neighbourhood of Nottingham there are the following places of interest:—Carlton Chapel; St. Leodigarius at Basford; Woodhall at Bulwel; St. Patrick's Church; and the manor-house called "Nuthall Temple," at Nuthall and Wollaton Hall. Within a few miles are Ledling, Ruddington, Ratcliffe, Bingham, and Newstead Abbey. The Minster of Southwell, with its Norman nave and wonderful Decorated chapter-house, is only about 12 miles from Nottingham. Newark is about 18 miles from Nottingham, and has in its church some of the finest oak screens in England. The lower half of the tower of this church is of the Early English Gothic style; the upper hall and the steeple are excellent examples of the Decorated period. Some picturesque half-timber is also to be found in the market-place of this town. Peterborough, and the neighbouring towns of Castor, Nassington, Oundle, Fotheringay and Brigstock, form a happy hunting-ground for the architect, and are within 30 miles of Nottingham—a distance not outside the range of the bicycle. G. A. T. M.

If "South Notts" will repeat the enquiry in regard to the water-supply to fifteen small houses which he sent us a short time ago, with further particulars, we will endeavour to answer it. A letter sent to the address given by him has been returned to us "not known."

Bricks and Mortar.

Aphorism for the Week.

Cleverness is serviceable for everything, sufficient for nothing.—Amiel.

Our Plates. No. 46, Great Marlborough Street, W., replaces a structure which unfortunately was wrecked by the failure of the party-wall during the rebuilding of the adjoining premises. The front is in red bricks with Portland stone dressings, the ground floor being faced with Aberdeen grey granite, unpolished. Messrs. Mark Patrick & Sons were the builders.—The offices of the Union Castle Company in Adderley Street, Cape Town, have been erected for Messrs. Donald Currie & Co. The whole of the ground floor and most of the upper floors are now occupied by the Union Castle Company as offices. The building is of brick, faced with Palmeit River stone, in Adderley Street, and with cement rough-cast elsewhere, Cape Town bricks being of very inferior quality. The building which stood formerly on the site had a portico or verandah the full width of the pavement and frontage, supported by fluted Doric columns of stone, with a regular entablature and balustrade. As originally designed this building had a similar portico in front to give shade to the ground floor and to foot passengers. The city authorities, with truly British perversity, declined to permit any new columns to be of a greater diameter than 8in., which would only give the type of verandah seen in the photograph on either side of the Castle Company's premises. The Company decided that it would be better to have no verandah than a cast-iron one. The roofs are slated with an American slate, the lathing is of expanded metal throughout, and the lift is worked by hydraulic pressure. Messrs. W. Dunn and R. Watson were responsible for the design of the building, and Mr. Herbert Baker, of Cape Town, for the general supervision.—The bungalow at Tunbridge Wells is proposed to be erected in the Caterham Valley of half timber and rough-cast, with red-tiled roof. The accommodation is shown by the plan on this page.

The Royal Academy. The Council of the Royal Academy who will choose the works to be exhibited this year consist of the following:—Sir Lawrence Alma-Tadema, Mr. G. F. Bodley, Mr. G. F. Frampton, Mr. J. W. Waterhouse, Mr. W. F. Yeames, Mr. Val C. Prinsep, Mr. J. MacWhirter, Mr. W. Q. Orchardson, Mr. Henry Woods and Mr. T. G. Jackson. From this it will be seen that architects will have to reckon with Mr. G. F. Bodley and Mr. T. G. Jackson. The sculptors who visit the Modelling Schools in 1903 are Mr. T. Brock, Mr. H. H. Armstead, Mr. G. J. Frampton, Mr. Goscombe John and Mr. Alfred Drury; and the students of architecture have the benefit of the advice of Mr. T. G. Jackson, Prof. Aitchison, Mr. G. F. Bodley, Mr. Belcher and Mr. Aston Webb.

An International Building Exhibition. It is stated that all the plans for the forthcoming Building Exhibition at the Grand Palais, Paris, have been satisfactory arranged. The exhibition will be open to all nations, and it is asserted that Great Britain, Belgium and Germany have taken particular interest in the proposed show. Belgium, which has paid much attention of late to the erection of dwellings at moderate cost, both for artizans and others, will send the best plans and information she possesses on that subject, and the same may also be said on behalf of Great Britain. The success of the coming "Exposition du Bâtiment" appears to be already assured. The display of exhibits from all quarters of the globe is certain to offer a curious sight from the technical and artistic point of view, while from the social one it may contribute greatly to the solving of a problem occupying all civilised countries. The date of the opening of the exhibition is not yet known.

The Exeter Cathedral Glass. The Society of Antiquaries strongly resents the proposal to remove Peckitt's glass in the west window of Exeter Cathedral and replace it by a memorial to the late Archbishop Temple. They contend that although it may not be "of the highest quality as stained glass, yet it forms a milestone in the history of the art, and as such is deserving of respect. . . . The window is said to be in bad taste. But surely in dealing with a fabric of such slow growth as a cathedral, this is dangerous ground to take. Are the seventeenth-century and later monuments in Westminster Abbey in 'good taste'? . . If the Dean and Chapter of Exeter sweep away all parts of the structure in their cathedral that may not seem to them to be in the best of taste, they will go far to destroy the story of the building and will have an account to settle with posterity."

The Smallest Church in England. The smallest church in England is claimed to be part of that of the village church at Upleatham, in North Yorkshire. It measures only 17ft. 9in. by 13ft. A Frenchman who has measured the church says it is smaller than any building of its kind in France by 4½in. The church dates back 900 years, and some of the tombstones in the graveyard bear date 1550. The old edifice is nestled in a lovely valley in the Cleveland district. It is mentioned in "Domesday Book," and in all probability it was an old building then. It is now used as a cemetery chapel, its burial-ground containing some very old stones in fine preservation. The church contains set benches, and seats about twenty. This little edifice having at different periods undergone both alterations and repairs, much of its antiquity is destroyed. The tower was rebuilt in 1684, and bears that date engraved on the stonework nearly at the top. Upon the floor beneath the stalls on the north side there is an ancient effigy much mutilated. On the extension of the north wall of the nave still remain a series of well-cut Norman corbels, the westernmost being the effigy of some animal (probably a dragon) carved in a quaint attitude, but now almost obliterated. The font was some years ago removed to the new church built in 1835. On the floor is one of the finest gravestone or coffin-lid crosses in Cleveland. Over this is a mural niche with cusped and pointed arch (probably late fourteenth century).

Roman Finds. In the course of the construction of the new road at Watermoor, Messrs. G. F. & E. Newcombe, the contractors (the work being done under the direction of Mr. V. A. Lawson, architect), discovered some relics of the Roman occupation of Cirencester. Not much more than 1ft. below the surface of the ground was discovered the massive stone kerb of what proved to be a singularly complete Roman well, about 12ft. deep, the facing stones of which had been carefully worked concave. The kerb or topstone of the well was cut out of a solid block. The new road was also found to cross, almost at right angles, and exactly at the spot pointed out by Mr. Wilfred Cripps, C.B., from his plan of the Roman town, the continuation of the great Foss Road running straight through the town, roughly speaking from north to south. The section uncovered by the operations shows it to be a very substantially made road, about 38ft. wide, while the metal is at least 8ft. thick. There was barely 1ft. of soil above the surface of the road. Mr. Wilfred Cripps is having excavations made in the garden of Chester Lodge, and has come upon the walls of some considerable Roman buildings, situated in the locality which the presence of basilica and other erections marks as the forum or market-place of the Roman city.

Towers and Spires. The Associate Section of the Edinburgh Architectural Association held a meeting on Wednesday, March 4th, in the rooms, 117, George Street, Edinburgh, Mr. J. Douglas Traill in the chair. Mr. J. Gillespie read a comprehensive paper on "English Towers and Spires," which took the form of a review and criticism. In the course of his paper he dwelt first upon the importance of towers and spires in architectural design, pointing out how their use on a building at once adds to it that stateliness and dignity which elevation always conveys. He contended that for good outline and beauty of detail none could be found that excelled the Gothic spires of England. The position and uses of the central and western towers were explained. The history of spire-growth was next dealt with, beginning with the simple pyramidal capping of the Norman Period, then the "broach" form of spires, with all their variations and developments so commonly employed in the Early English period, and finally the Decorated and Perpendicular towers and spires. Numerous examples of each class were shown and discussed. The paper concluded with some Renaissance, some Scottish, and some Edinburgh towers and spires. The whole was illustrated by a large number of limelight views and measured drawings.

Construction Notes.

A New Limestone. The selection of a building stone for any particular work is one of the most important duties of an architect or engineer, requiring expert knowledge, careful consideration of existing buildings, the state of the quarry at the time, the best beds, and most watchful inspection at all times. When stone from a newly-opened quarry is to be decided upon the difficulties are enormously increased, for there is no fund of experience in long-executed buildings to go to. It is not to be wondered at, therefore, that there is a remarkable sameness and a small range in the varieties of stone used in large buildings and monumental structures. In London Portland holds chief sway; used by Wren in his City churches and St. Paul's, we have a standing example of its splendid qualities, but all depends upon the quarry bed from which it is taken and the weathering to which it is there subjected. Years ago Craigleith—a sandstone—was largely used in important buildings—the Bank of England, the Royal Exchange, British Museum, the General Post-Office and the Stock Exchange being examples, but the exhaustion of the best beds at the quarry and its costly carriage from Edinburgh have led to its general abandonment. But it is not my purpose to speak of these stones. The mention of them merely serves to call attention to the welcome which must be accorded to any addition to our stock of building stones worthy to rank as suitable for the best work. I do not think I am going too far in claiming this for the Edithweston Freestone. The oölitic limestones of Northampton and Lincolnshire are very remarkable. At the famous Bornack quarries, in Northamptonshire, from which stone was obtained for Peterborough Cathedral, all the best beds are unfortunately now worked out. Close to Bornack are the quarries of Ancaster in Lincolnshire and Ketton in Rutland. Weldon in Northamptonshire is another old quarry. Ketton stone has been used for a number of important buildings, among which may be mentioned St. Dunstan's Church in Fleet Street, London; the modern part of Peterborough and Ely Cathedrals; Sandringham Hall; St. Pancras Railway Station, and the restoration of Westminster Hall. Stone from the best beds at Ketton is obtained with more difficulty every year, and there is danger of its becoming exhausted. This has been compensated however by the Edithweston Freestone Quarries, opened by Major Craithwaite about five years ago, and since worked and managed by his agents, Messrs. Woodford & Wing, of Stamford. This bed of freestones, though not actually in Ketton parish, forms part of the same hill and lies only 500yds. from and at the same level as the famous old Ketton quarries, and the stone seems to be really a reproduction of the best old "Ketton" which was so extensively used in the past. The stone is of a beautiful cream colour and fine even texture, is easily worked, the labour being about equal to Bath, Ancaster, Beer or Ham Hill, and a very fine arris can be obtained. It is stated that it need not be fixed on its natural bed, but this is inadvisable with any stone. It is an oölite (the name is derived from the Greek word signifying "egg-stone") composed of egg-like grains of carbonate of lime (each in section of several concentric rings like an onion), similar to a fish's roe, and the grains of somewhat larger size than Caen stone constituting what is called a "roe stone." Edithweston stone has been supplied for the stonework of the following recently-erected buildings: new Cemetery Chapel, Leicester; Hospital for Infectious Diseases, Leicester; London City and Midland Banks at Nuneaton and Peterborough; Midland Counties and Barclay Co.'s Banks at Peterborough; and the Grand Hotel, Southwold. The nearest station is Ketton, one mile distant on the Midland Railway, and the price is 2s. 1d. per cub. ft. on rail at Ketton, or 2s. 6d. at London termini.

A New Decorative Process. Within the last few years a new process of decoration has been developed in Austria and Germany which enables some very beautiful effects to be obtained. The process primarily consists in using a special cement. This cement is supplied as a thick liquid; it has no free lime in its composition which would be destructive to colours, and does not adhere to the fingers, for it dries without the stickiness of a paint or varnish. This cement quickly thickens when exposed to the air and can be used in any degree of consistency, being available for modelling after some time. Colours may be mixed with it, and in the more liquid condition it may be used with a brush for painting in relief like gesso. It is used on the Continent, however, in quite a new manner and certainly to its greatest advantage. The process consists in taking string of any desired thickness and covering and soaking it with the cement by drawing it through it and then using the string to form the boundaries of any pattern on any surface by sticking it down. The cement impregnates the substance of the string, preserving it against damp and decay. The spaces between the string boundaries may now be filled up in any way with the cement and modelled to gain any effect. It will be seen at once that the use of the string to form the boundaries enables work to be done quickly, and for any linear decorative forms the process is of course essentially easy and appropriate. Cloth, wool, tow or other material, can be soaked in the cement in the same way and used to model up forms. This is a feature of the process which is made much of in Germany, for the cloth is cut in a particular shape, say, for a lily, and then a number of workmen can be easily trained to arrange it in form so as to look exactly like modelling in low relief. When the cloth has adhered it is brushed over with the liquid cement to obtain an even surface. When dry, the surface can be coloured or painted upon, ordinary oil colours being a very suitable medium, sinking into the plaster-like cement, giving a fine dull colour, or, by varnishing, a shiny effect. The process is an artistic one, for it is easier to make everything different than to make all alike. One use which is made of the process on the Continent deserves special attention; modelled corner-pieces, decorated with colours, are supplied to ceilings and affixed in position and connected to each other by means of lines of string, which may be gilded or coloured with any other tint. Of course the cost of a few extra yards of string is immaterial, so that a large ceiling costs no more than a small one. The whole cost of a ceiling decorated in this manner is about £2, or of course more if more elaborate, but the superiority of this method for artistic appearance over the miserable plaster ceilings with stock plaster-cast ornaments in our houses is immense. Mr. A. Strauss-Collin, of Bush Lane House, Cannon Street, E.C., is exploiting the process in this country, and supplies the cement, giving full instructions, or will furnish decorative designs, panels, &c. The ease and quickness of the process has in foreign lands led to excesses, and much of the awful L'Art Nouveau interior decoration may be traced to it, and in particular the stringiness or lininess of the forms; but, of course, everything can be carried to excess. There is nothing against the process itself, which offers many advantages and should be largely used; all depends upon the artistic taste and ability of the designer. H. K. D.

Builders' Notes.

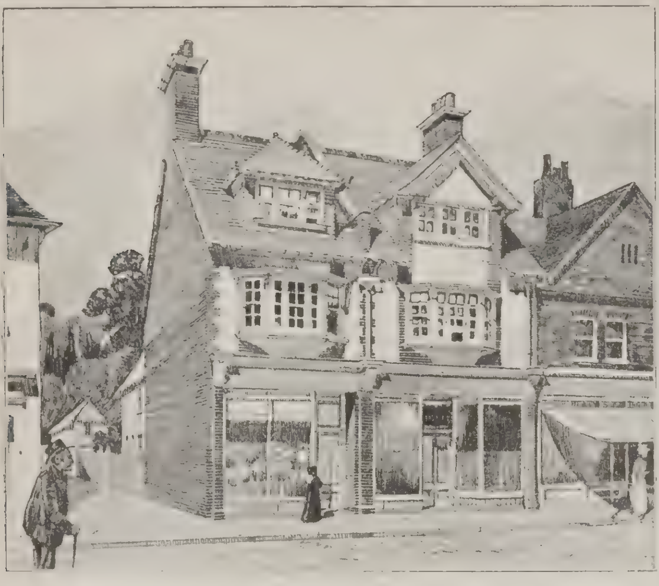
London Master-Builders' Association: New Officers.—President, Mr. Ernest J. Brown; senior vice-president, Mr. James Carmichael; junior vice-president, Mr. Frederick Higgs; treasurer, Mr. John Greenwood.

The Isolation Hospital, Etwall, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their double-fronted patent Manchester stoves with descending smoke flues and special inlet panels.

The Will of Mr. A. W. Spencer, of South Kensington, a partner in the firm of Spencer, Santo & Co., the builders of the New India Office, has been proved, the value of the estate being £1,790.

Plumbing.—An indenture or agreement of apprenticeship framed by the Plumbers' Apprenticeship Board of London has been adopted in substance by the National Association of Master Plumbers and the United Operative Plumbers' Association of Great Britain and Ireland, as well as by the London Master-Builders' Association. The material points of agreement are:—(*a*) The art of sanitary plumbing taught under the indenture is defined as "technical knowledge of water fittings and other sanitary appliances, and skill to construct and adjust the same in such manner as to prevent the contamination of air or water in dwelling-houses or other buildings by emations from drains and sewers"; (*b*) the apprentice is required to attend approved evening classes of technical instruction; and (*c*) to attend periodical examinations in technical knowledge and workmanship during the term, the final examination qualifying for registration by the Plumbers' Company or any statutory body established for maintaining a National Register of Plumbers in the public interest. Under the general provisions of the indenture other branches of trade may be taught, but it is required that the instruction in sanitary plumbing should conform to local and other regulations affecting the efficiency of plumbers' work in its sanitary aspects as defined. The form has been adapted to the requirements of Scottish law. Classes of instruction are provided by the local educational authorities, and the practical branches of the examinations are conducted under the regulations of the Plumbers' Company by joint boards, including employers and workmen.

Menai Suspension Bridge during the gale last Friday week was completely lifted off its bearings. The bridge, at a height of some 200ft. and for a stretch of nearly 600ft., spans the Menai Straits and connects the county of Carnarvon with the island of Anglesea. The great structure succumbed to the terrible wind-pressure which had continued for about a fortnight. Floating free from its connections with the massive stone pillars on either side of main span, to which each end of the actual "bridge" is connected, it swung and swayed violently in the hurricane. At about seven in the morning, according to the toll-keeper on the Carnarvonshire side of the Straits, the wind was about the height of its power, and looking up the bridge he saw the whole of it swing far out of its bed, as if about to part company for ever with its sustaining chains and piers. The chains, however, held stoutly, and after an instant's poise in mid-air, the bridge slowly swung back into its accustomed place, there remaining, but with constant and alarming oscillations. As the gale moderated the bridge became steadier, and traffic was resumed. This shows the fatuity which places the whole telegraphic system of the county dependent on cables passing along this bridge. It is pointed out that they could just as well have been run across the immovable tubular bridge close by, or taken by a submarine cable.



BUSINESS PREMISES, ASCOT. GEORGE HORNBLOWER, F.R.I.B.A., ARCHITECT.

LONDON BUILDING ACTS.

The Withdrawal of the Amendment Bill.

At last week's meeting of the London County Council the Parliamentary Committee submitted the following report upon the London Building Acts (Amendment) Bill :—

We have given our most careful consideration to the course to be adopted with regard to this Bill, which has now been read a first time in the House of Commons. Instructions to us to promote the Bill were given by the Council on November 4th last, and time did not permit of our ascertaining the views of the various authorities and bodies concerned before submitting the Bill to the Council for approval. We have not at the present moment been furnished with the views of some of the more important technical bodies, but, from such observations as we have received and from information which has reached us from various quarters, we regret that we are driven to conclude that the Bill will, if proceeded with in Parliament, encounter very considerable opposition. We are advised that many of the suggestions which have been received would form bases for useful amendments of the Bill in detail, and that had time permitted the Bill might with advantage have been in some particulars differently drafted. It is with great regret that we arrive at the conclusions embodied in the recommendation which we submit concerning a measure for the protection of human life and property from the perils of fire, and in doing so we are influenced by the knowledge that the Council will, with more time at its disposal, be in a position, if it adopts our recommendations, to place before Parliament in the session of 1904 a more complete and perfect measure. It is important that any step in the direction of withdrawing the Bill should be taken without delay in order that such authorities and bodies as may wish to take action with regard to the Bill may not be put to any unnecessary expense and trouble. We accordingly recommend: "(*a*) That, notwithstanding any previous resolution of the Council, a Bill to amend the London Building Acts be promoted in the next session of Parliament, instead of in the present session; and that the London Building Acts (Amendment) Bill, 1903, be not further proceeded with. (*b*) That the Bill as at present drafted be referred to the Building Act and Parliamentary Committees with a view to their advising the Council, after consultation with such persons and authorities as may be desirable, as to the ultimate form the Bill should assume."

The chairman of the Committee (Mr. Radford) refused to move the adoption of the recommendation, having disagreed with it and given notice of an amendment in favour of instructing the committee to proceed with the Bill. Thereupon a long discussion ensued, the recommendations of the committee being eventually adopted by 66 votes to 27.

In view of the withdrawal of the Bill the Mansion House meeting convened for Thursday last was not held.

In a report which they prepared at the request of the Assessment Committee of the City of London Union, Mr. W. H. Wagstaff and Mr. M. L. Saunders state :—

"It must be remembered that the process of reconstructing city premises has been going on rapidly in recent years, and from experience all new buildings, including 'the high buildings' referred to in the Bill, have been reconstructed to meet all requirements of escape in case of fire. Therefore no new or exceptional legislation is necessary, and if modifications of the Building Act of 1894 are required they can be met by a simpler Act, not retrospective as proposed. In twelve of the clauses of the Bill there is reference to discretionary power to be used by the London County Council, such as 'satisfaction,' 'reasonably practicable,' 'opinion of the Council,' 'as the Council may prescribe,' 'as the Council may think fit,' and such other phrases which appear to be most objectionable. It should be remembered that the Bill is a penal one, and all matters should be definite, and no discretionary power allowed; nor should there be any power of making by-laws. If the London County Council propose that the cost incurred in carrying out these alterations and suggestions is to be considered as money laid out upon buildings, and thereby raise the assessment thereof, then it would mean increasing the rating, whilst the buildings would themselves be far less valuable for the purpose of trade. In the second schedule attached to the Act of 1894 it is mentioned that stone and iron are fire-resisting materials; do the London County Council so regard them? This Bill is perhaps as good a specimen as could be found for giving work to the unemployed and providing employment for solicitors by unlimited litigation."

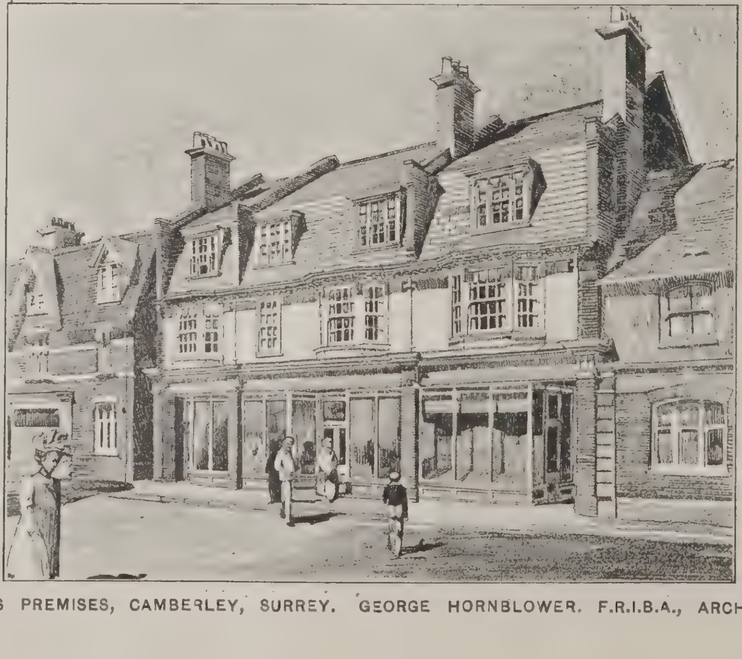
The Royal Institute of British Architects had decided to oppose the Bill.

In the House of Commons on Wednesday last the order for the second reading of the Bill was discharged and the Bill withdrawn.

At last week's meeting of the London County Council the Highways Committee recommended that a sum not exceeding £21,100 be expended on new sub-stations and workshops at New Cross and Camberwell, required in connection with the electrical working of the County Council tramways; and that the work be carried out without the intervention of a contractor. Mr. E. White, in moving that the recommendation be referred back, said the proposal was an entirely new departure, for it had always been understood that the estimate should be based on drawings, specifications and bills of quantities. Now it was proposed by the Highways Committee to estimate the price on cubing, and to pay 5 per cent. above the priced bills of quantities of the Mill Lane lodging-house. A lodging-house was a very different building from a car-shed, and he submitted that instead of an increase there ought to be a decrease in the estimate for the car-shed. Mr. Benn said the essence of the contract was rapidity of erection, and the proposal was made on the advice of their architect.—The amendment was defeated and the recommenation agreed to.

The Highways Committee recommended an expenditure of £208,000 on the construction of the tramway subway authorised between Southampton Row and Victoria Embankment. The matter was referred back.

Business Premises at Ascot and Camberley, Surrey.—These premises are built in red bricks and the fronts finished in rough-cast, with red-brick dressings. The roofs of the Ascot premises are covered with green slates and those of the Camberley premises are tiled. Mr. H. Charman, of Ascot, was the builder of the Camberley premises and of the largest shop at Ascot (which was erected on a corner site in the High road); they were carried out under the superintendence of the architect, Mr. George Hornblower, F.R.I.B.A., of 2, Devonshire Terrace, Portland Place, London, W.



BUSINESS PREMISES, CAMBERLEY, SURREY. GEORGE HORNBLOWER. F.R.I.B.A., ARCHITECT.

THE ARCHITECTURAL ASSOCIATION

COMPETITIONS.

Papers by **ALFRED W. S. CROSS** and **BULKELEY CRESWELL.**

A MEETING of the Architectural Association was held last Friday, Mr. Louis Ambler, F.R.I.B.A., vice-president, in the chair. The following gentlemen were elected members:—Messrs. Frederick J. Commin, W. Curtis Green, Walter Gilbert, Frank Jennings, Owen Dudley, George Felix N. Clay and C. F. A. Voysey. Messrs. E. J. Wellman and A. B. Yeates were reinstated members. The chairman then announced that a donation of £10 10s. towards the new premises fund had been received from the Birmingham Architectural Association. Mr. Alfred W. Cross, M.A., F.R.I.B.A., then read his paper, of which the following is a summary:—

As one who is greatly in favour of the system of obtaining designs for public buildings by means of competitions, I am, unfortunately, unable to agree with many of the views adopted by Mr. Creswell in his extremely able paper. I have had, quite recently, the pleasure of perusing an equally excellent paper on the same subject by Mr. G. H. Willoughby, of Manchester, in which its author, a strong believer in the system, as he has shown by both precept and practice, writing from a standpoint diametrically opposite to that selected by Mr. Creswell, argues in its favour, as follows:—

"From my point of view, it is a mistake to suppose that the profession can dispense with healthy, stimulating competitions. A man never knows what is in him until he has measured himself with his fellows in real honest work of this kind.

"Consider what a large field for effort is presented to our younger men at the outset of their career, when youth, with its enthusiasm and capacity for work, is so strong.

"With many the commissions which they have in hand fail to fully occupy their time. Does not the opportunity thus afforded through the medium of competitions, which is, I think, confined to our profession, create, if grasped, a lasting habit of steady, continuous application and activity—a prelude to the time when hands and head will be fully occupied on more certain work?

"Let me remind you of the endless opportunities which cross our path, through the medium of competitive problems, for the study and investigation of the many kinds of structures the architect of to-day is called upon to design."

These words of Mr. Willoughby represent with more or less exactitude the views of those architects who, while believing that competitions are desirable and tend to the advancement of architecture, are at the same time determined to do their utmost to remedy the undoubted evils connected with the competition system in vogue in this country, which evils, involving as they do many miscarriages of justice and frequent deviations from rectitude on the part of promoters and assessors, must be rooted out, and with this object in view a Society for the Reform of Competitions has been formed, and is now, I honestly believe, doing good work in its efforts to protect members of our profession against the wiles of unscrupulous promoters of competitions. But, after having made good their position with regard to promoters, competing architects should advance a step further and insist upon the employment, wherever practicable, of a jury of assessors in place of the present one-man system, which has proved to be a dismal failure. It is neither desirable nor necessary for me to enter into particulars, or to call attention to specific instances in which flagrantly unfair awards have been made, the general fact is common knowledge, and there are doubtless many members of this Association who have suffered at times from the incompetence, lack of sound judgment, call it what you will, of certain assessors.

In France, where, as a matter of course, "they manage these things better," and in America, the jury system is now almost always applied to important competitions, in the latter country with the code for the conduct of competitions presented to the American Institute of Architects at their annual convention in 1900. (Mr. Cross here read the code which was published in our issue of July 3rd, 1901.)

Whilst one may not agree absolutely with each individual clause in this exhaustive code, yet, broadly speaking, it appears to have been carefully and impartially framed alike in the interests of both promoters and competitors, and it is fundamentally sound in its insistence upon the following essentials, which should be borne in mind during the preparation of every set of conditions issued to competitors in this country.

(1) A definite pledge should be given by the promoters as to their intention to retain the services of the successful competitors.

(2) The conditions should be framed to constitute a contract between the promoters and the competitors.

(3) The drawings required should be of the simplest kind necessary for explaining the competitors' schemes.

(4) A copy of the assessor's report should be sent to every competitor.

(5) No communication, except in writing, should be allowed upon anything relating to the competition between any competitor on the one hand, and the owner or any representative of the owner, the professional adviser, or any juror, on the other.

With regard to (1), this clause is essential to the success of any properly organised competition. Promoters must be brought to understand that the payment of a premium is quite insufficient to reimburse the successful competitor for his outlay of time and money. As to (2) this proposal is an innovation as far as this country is concerned, but it is one that will form, sooner or later, an integral part of the conditions of the competitions for all public buildings. (3) has been evidently framed with the object of minimising the amount of work required from each competitor, and any experienced competing architect will vouch for its necessity. (4) Constitutes a laudable attempt to allay many of the heartburnings that almost invariably follow an award. In my opinion, it is very desirable that a copy of the assessor's report, containing the award and his critical notes on the various designs, should be issued to every competitor. I have here a copy of such a report, kindly lent to me by its author, Mr. Paul Ogden, of Manchester, which is, in my opinion, ideal in its characteristics. It contains photographic reproductions of all the plans submitted, together with the assessor's criticism of each design, by which competitors are enabled to obtain a very fair insight into the reasons governing the award.

The last stipulation (5), although it might perhaps be strengthened, is, I think, a wise one as under our haphazard system, or rather want of system a competitor is often tacitly allowed to obtain special information from individual members of the promoter's committee or from officials and subordinates connected with them, and this course of action is to be depreciated, as the contest between the competing architects should be fought on the information conveyed by the conditions, and by the subsequent replies to questions and by that information alone.

On the whole, I think, gentlemen, you will agree with me that the problem relative to the conduct of architectural competitions having been successfully solved by the American architects, it is the duty of all members of our profession in this country to support the movement that has recently been initiated to ensure a similarly satisfactory result here. By doing so you will be upholding the dignity of the profession, for what other body of educated men receives the insults that are constantly offered to us by promoters of competitions, who often indeed advertise for designs for buildings which they have not the slightest intention of carrying out, or for which they have actually selected their architect before the issue of the conditions for their so-called competition. To put it briefly, competing architects must sift the good competitions from the bad ones, and protect themselves against unfair or incompetent assessors by insisting upon the introduction of the jury system of assessing. The only argument I have heard advanced, so far, against the appointment of jurors is that emanating, I presume, from those architects who have too great an appreciation of the value of the fees obtainable under the present system of assessing to make them desire any change, to the effect that the excessive cost of the jury system militates against its adoption, but if—as in America—no first premium be awarded, and the definite commission to carry out the work be substituted, there would not be apparently any insuperable difficulty in providing the necessary funds for the payment of three or four jurors.

Mr. Bulkeley Creswell then read his paper, of which the following is a summary:—

The whole subject of competitions in almost the same aspects and involving the same dilemmas, the same difficulties, the same differences of opinion, has beset our profession like an incubus, and has provoked lengthy discussions, protracted correspondence in the professional journals, special commissions, sworn fraternities and self-denying brotherhoods continuously for nearly 100 years. I can assure anyone of you who cares to refer to the records which will be found within the walls of this building that he will be truly amazed at the huge amount of energy, mental activity, arguments, research and classification of facts which have been brought to bear on this subject and, I may add, by some of the most conspicuous and able men of their day; and yet, although in the particular of professional assessors, promoters of competitions have fallen partially in line with our views, the main question remains no nearer solution, and the confusion in the conduct of competitions is perhaps as great as it ever was.

I would remind you that competitions do not in any way influence the number of buildings erected. Thence the whole mechanism of competitions effects nothing more than the selection of those particular architects who shall be appointed to execute certain particular buildings. Their whole justification rests then on the substantiation of the fact that the process of selecting architects by competition is better for the profession and for the national architecture than if the architect were selected by his reputation or by his proved fitness for the work. The question is *not* whether competitions afford a short cut to notoriety for individuals, but whether, taken as a whole, that system of selection is the best. I am not going to urge the reasons which convince me that the competitive method of selection is a bad method, as a frequent usage, and bad in all cases, except for limited competitions, but I will ask your permission to quote the mature opinion of the late Professor Kerr on this subject. He is reported to have spoken these words in 1871: "The only conclusion I can arrive at with any regard for common-sense is that the system of architectural competition is radically unsound in principle, and in practice most prejudical to the profession of architects, both financially and morally. Whether it benefits the public in any way may be for a moment questioned, but even on this point I believe the answer must be eventually in the negative . . . . I have never known any man succeed in establishing by competition any reputation which he would not have better acquired without it, except occasionally a bad reputation, which, but for competition, he might fortunately have been able to escape. I know of no other temptation in business so subtle as that which assails, as I think, a high-minded man when involved in architectural competition, and especially if he be successful. I know of men who have succeeded by competing in attaining to the promise of a position which they were not qualified to hold, but they have never been able to retain it, and have in several cases been ruined in their legitimate prospects by the consequences of such hasty and fallacious good fortune. I do not hesitate to say that competition success leads generally to personal and public disrespect; and this not through jealousy alone or personal offence, but by reason of the ordinary estimate of the qualities by which alone such success can be obtained."

I will remind you at what cost and by what burdening of ourselves do we acquiesce in this system of competitions. There are about thirty-six unlimited public competitions advertized yearly in England alone. The value of the average building is about £9,000, the number of competitors about forty, and the value of the first premium about £56 (with further premiums aggregating to £52). In a competition for a building costing £9,000 the drawings would cost each competitor between £2 and £800 (my own personal estimate is £30, which seems a moderate one), so that we may consider the cost of producing the drawings would be £1,200, which is near three times the sum which would be paid by the promoters by way of commission to the architect for designing and carrying out the works. I have found that the value of buildings advertized in the years 1894 and 1895 was £540,000, which is a sum of £270,000 in each year. I have it on the best authority that at least half the number of architectural competitions are not advertized in the London papers, so that we may decide that the value of buildings advertized in competition in one year in England amounts to no less than half a million. The cost of producing drawings in respect of these buildings, deduced from the figures I have already given you, is £65,000, estimating the average competition at £9,000.

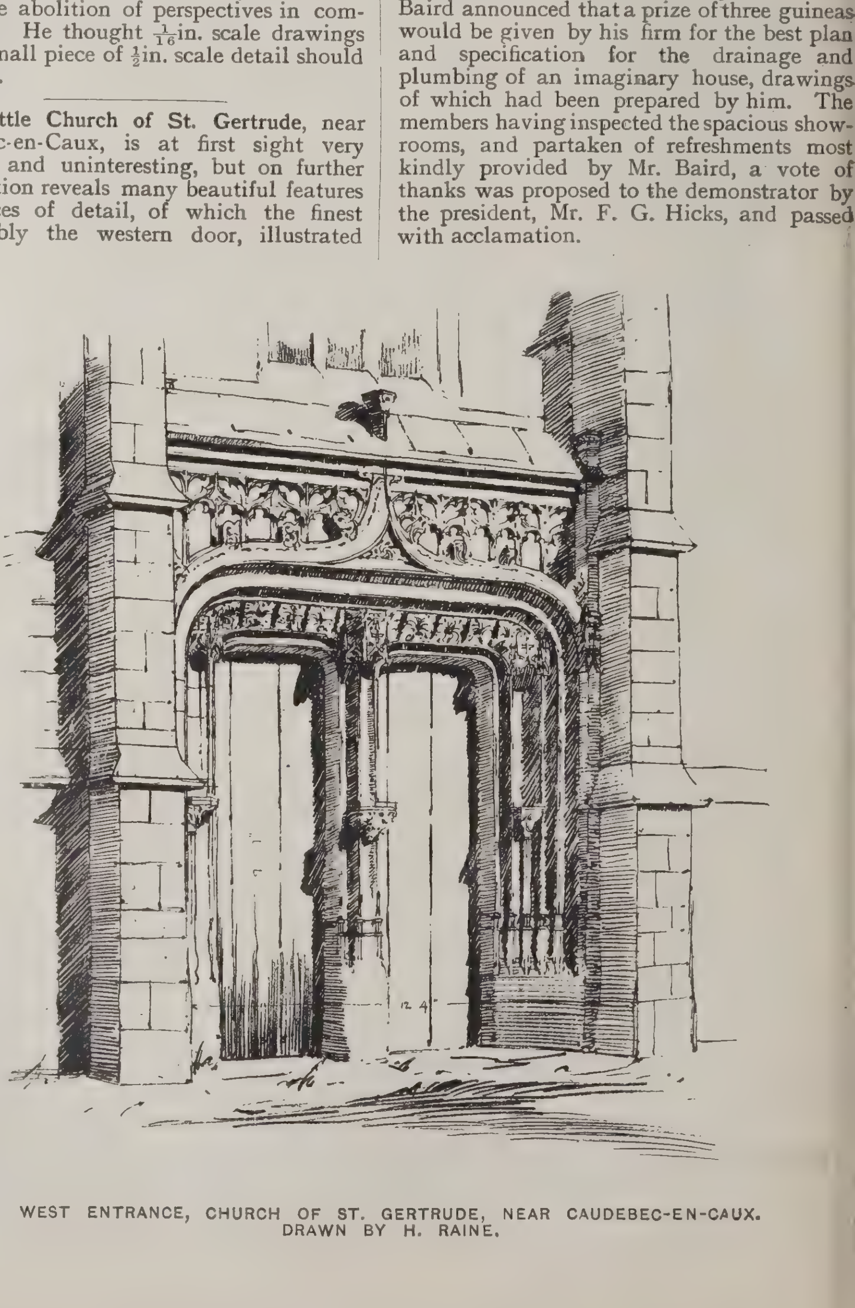
I once heard a young man referring to competitions as the "young man's friend." What he wanted to say was, "I am a young man and have just won a competition." It is exactly this personal, circumscribed, prejudiced attitude towards competitions which has kept us all these eighty years and more in hopeless quandary. The framing of competitions and the enactment of competitions is, as I would insist, purely a matter of business and of commercial enterprise. The conduct of a public or limited competition is clearly of a matter of contract, and it is the business of each party to see that his interests are properly protected in the terms of that contract. It is, therefore, weak and futile for competitors persistently to cry out and protest when they find that they have the worst of the bargain.

The 5 per cent. commission is stipulated to include quantities or extraordinary expenses in 16 per cent. of competitions. The premiated drawings are to be the property of the promoters in 77 per cent.; the written rules, and the unwritten rules of the profession are frankly ignored, and we give our approval to this state of affairs in the most emphatic manner possible and proceed to keep this monstrous thing alive and healthy among us in the face of rebuffs and affronts. The very assessors who are selected from the pick of us to advise the promoters, themselves become parties to and elaborators of these very usages, which we have never found words enough to deplore and execrate.

What I wish to lead up to is the conclusion that the impracticable and unfair qualities of public architectural competitions as now conducted is not to be laid to the charge of the people who promote them, but is to be entirely laid to the charge of ourselves, who have in all particulars and details made the procedure, traditions and the conduct of competitions just exactly as they are and exist in every respect and in every particular. So surely as we declare that we will be parties to no competitions of which the conditions are unreasonable, ambiguous or incompatible with personal or professional dignity, straightway such competitions will cease to exist. If we cannot keep off unruly competitions by any other means, let us take the pledge, let us join a certain active society lately started, and foreswear competitions unless they are as we hold they should be.

A discussion followed in which Messrs. H. W. Wills, W. H. Seth-Smith, Bramwell Thomas, William Pite, John Murray and Louis Ambler took part, the first two named proposing and seconding the vote of thanks. A letter from Mr. Sidney R. J. Smith in urged the abolition of perspectives in competitions. He thought $\frac{1}{16}$in. scale drawings with a small piece of $\frac{1}{2}$in. scale detail should be ample.

The little Church of St. Gertrude, near Caudebec-en-Caux, is at first sight very ordinary and uninteresting, but on further examination reveals many beautiful features and pieces of detail, of which the finest is probably the western door, illustrated below.



WEST ENTRANCE, CHURCH OF ST. GERTRUDE, NEAR CAUDEBEC-EN-CAUX.
DRAWN BY H. RAINE.

A.A. OF IRELAND.

THE eighth technical demonstration, on House Plumbing and Drainage, in connection with this Association was given in the workshops of Mr. William Baird, 12, Lower Abbey Street, Dublin, on Friday afternoon last. Mr. Thomas Baird acted as demonstrator, and explained the various methods employed in the trade with the greatest clearness and lucidity. Mr. Baird commenced by sketching the types of drains in use in the olden time before the advent of the Public Health Act, some formed with an inverted ridge-tile, and others through which a man could walk with ease, and which have since been effectually supplanted by a 6in. fireclay pipe. Various kinds of earthenware and iron drainage pipes were then exhibited and jointed by a practical drain-layer. Having been shown the application and construction of traps, access appliances, manholes and Armstrong junctions, samples of different sorts of pipe used in house plumbing, of lead, copper and gun-barrel, were inspected by the students. A wiped joint was also made, the approved connection for copper hot-water fittings. The members were much interested in the samples showing the defects caused by faults in the manufacture, and through disadvantageous circumstances. The best connections between sanitary fittings and soil-pipes were shown by examples, and usual defects explained. Mr. Baird announced that a prize of three guineas would be given by his firm for the best plan and specification for the drainage and plumbing of an imaginary house, drawings of which had been prepared by him. The members having inspected the spacious showrooms, and partaken of refreshments most kindly provided by Mr. Baird, a vote of thanks was proposed to the demonstrator by the president, Mr. F. G. Hicks, and passed with acclamation.

Correspondence.

Chepping Wycombe Town Hall Competition.

To the Editor of The Builders' Journal.

London, W.

Sir,—I am desired by the president of the Royal Institute of British Architects to ask you kindly to give publicity to the fact that the Corporation of Chepping Wycombe having altered their conditions to meet his views by adding to clause 3, after the words "themselves prefer," the words "but it is the intention and wish of the Corporation to accept the assessor's award unless there should appear any valid reason to the contrary," and having extended the time for the delivery of designs to April 4th, he has consented now to nominate an assessor.—Yours truly,

W. LOCKE, Secretary, R.I.B.A.

Middleton Church, Lancs.

To the Editor of The Builders' Journal.

London, S.W.

Sir,—Referring to the enquiry on p. 27 of your issue for February 25th, I would advise "Probationer, Todmorden," to visit Middleton Church (Lancashire), which I think is the nearest church to Todmorden containing any Gothic details worth measuring. It is Perpendicular work, and the greater part of it is in a good state of preservation. There is a very fine south porch and doorway worth measuring, although some of the mouldings and external ornament are not very clear. The church also contains a beautiful oak screen separating the nave from the chancel, which has some bold and luxuriant carving, interspersed with the arms of alliance of the Asshetons, who built most of the fabric, as indicated by an inscription on the south side of the church. There are also a few good bench-ends and some beautiful carving to the organ screen. In the window at the east end of the south aisle is a fine head of a bishop, and in the south chancel window is the representation in stained glass of a procession of archers on their way to Flodden Field, led by Richard Assheton of Middleton and their priest. The date of the glass is supposed to be 1515. The tower of Middleton Church is surmounted by a picturesque wooden four-gabled roof. Drawings of the church were submitted some years ago for one of the Institute prizes, but the competitor was not successful.—Yours truly.

W. EATON, A.R.I.B.A.

Licences for Making Valuations.

To the Editor of The Builders' Journal.

York.

Sir,—We note the answers as to architects taking out a licence for valuations, &c., in the last two issues of your journal. This is a question in which we are interested, as we have had considerable correspondence with the Inland Revenue authorities on the matter. We pointed out that according to a decision by Lord Ellenborough, as mentioned in Alpe's work on the Stamp Acts, we should not require a licence where the valuation was for the information of one party only, and that it was in no way binding, and this seems to be the view generally held. We also quoted Macey's "Conditions of Contract," but were informed that Lord Ellenborough's decision was overruled by a later Act; and in their final letter, dated September 8th, 1902, the Inland Revenue authorities stated "that an architect or other person, not licensed as an auctioneer or house agent, who, for fee or reward, makes a practice of valuing property or any interest therein, whether for probate or otherwise, and whether binding on parties or not, or who makes any appraisement liable to stamp duty, requires an appraiser's licence."

We also asked the secretary of the R I.B.A. as to the practice among architects, and in his reply he says: "As far as I can make out, most architects do odd valuations from time to time, without taking out an appraiser's licence, but this is at their own risk, and if the Inland Revenue authorities summon them to take out a licence, the right seems clearly to be with the Inland Revenue authorities." We are also told at the local Inland Revenue offices that as partners we must each take out the licence if we sign a valuation as a firm.

It will be noted that on the official answer the words "makes a practice" occur. Possibly they do not intend to press the matter if anyone has very few valuations, but in any case the matter is rather unsatisfactory, and as far as we can gather a great many architects are liable to be dealt with by the authorities, though we know of no case where they have been proceeded against.—Yours truly, HORNSEY & MONKMAN.

Glasgow Municipal Buildings: Machine- and Hand-cut Stone.

To the Editor of The Builders' Journal.

London, N.

Sir,—I notice in your issue for January 21st last a letter from Mr. William Burnett in which he endeavours to show that the Polmaise quarrystone which was used on three sides of the Glasgow Municipal Buildings is a durable stone, and supports his views with one instance of stone from the same quarry being used about twenty years previously (1863), when Col. Murray built Teuchadam Castle: and he attributes the cause of the decay of the stone on the Municipal Buildings to its having been cut by machinery, whereas that used by Col. Murray was hand-cut. I believe the question of hand *v.* machine cutting of stone is a very disputed point, some of our best engineers being of opinion that it is of not so much moment as that a good stone is chosen and laid with its proper face down.

I must differ from Mr. Burnett when he states that the stone used in the Glasgow Municipal Buildings came from the same quarry as that for Teuchadam Castle; twenty years is a good span, and I should rather think the stone came from a new quarry close by. But, assuming it did come from the same quarry, it does not follow that because one portion of a bed is found firm and durable a neighbouring portion may be so; the contrary is often the case; therefore for an important building it should have been properly tested and weathered. It may of interest to recall the fact that at the time the Municipal Buildings were about to be started there was an outcry by Glasgow architects as to the stone to be used. The smoke-laden atmosphere is no doubt the cause of some of the decay; but why soft and questionable freestones continue to be used by the authorities, not only in Glasgow but in other towns, is a mystery.

I should be glad to know the names of a few buildings in any districts where either the Polmaise or Dunmore quarry stones have been used; where either has been used in London; whether the part of the Glasgow Municipal Buildings under repair is where Dunmore quarry stone was used; and what stone was used in the more modern part of the old Municipal Buildings in Ingram Street, Glasgow.—Yours truly, H. W. E.

To the Editor of The Builders' Journal.

Stenhousemuir.

Sir,—In reply to "H. W. E." allow me to say that the Municipal Buildings and Teuchadam Castle are built from the same section of Polmaise quarry. True, there is now another section, but as the original could not cut away the public road the new section was started thirteen years ago on the other side of the road. The stone is seldom used now, however, although still plentiful, as it is harder to cut and more expensive to work. But it still weathers well when used. Regarding the testing of the stone, "H. W. E." has surely made some mistake, as nearly all the important buildings erected in Glasgow, Edinburgh and other towns in Scotland about this time were built of either Polmaise or Dunmore quarrystone. As an instance, I may say that in both of these quarries nearly 100 men were employed about that time. There was one notable building which might have been then examined, namely, St. Mary's Cathedral, Edinburgh, which took seven years to build and was finished, I think, in 1878. This building is weathering well, and not a bad stone is visible.

I quite agree that too little attention is paid regarding the laying of stones. There are far too many laid on the cant, where they do not weather so well.

The following are a few buildings built from these quarries:—St. Mary's Cathedral, Edinburgh; Comely Bank Poorhouse and Hospital, Edinburgh; Gilmorehill College, Glasgow; Dunblane Hydropathic; Blair Drummond Castle; Westquarter House, Falkirk; Stirling Town Hall; National Bank, Stirling; British Linen Co.'s Bank, Stirling; in fact, nearly all the buildings of note in Stirling, Bridge of Allan, Dunblane, Callander, and numerous others than those mentioned in Glasgow and Edinburgh which have been built since the quarry opened, have been built of these stones.

The only building where I am sure Dunmore stone was used is that erected for Messrs. Chambers, publishers, in Paternoster Row in 1867–8. As regards the third question, both Dunmore and Polmaise stones are under repair. I think it is Giffnock quarry stone which was used in the Ingram Street Buildings.

In conclusion, I may also say that Polmaise stone was used in the building of the Carron Company's blast furnaces, and stood the intense heat for from thirteen to sixteen years, whereas the brick blocks now used only stand at most seven years. The working of the stone is, however, the objection to its use here, being too expensive. On trying to cut one of the stones after use at the furnaces it was found to be very hard, but it would not stand the weather.—Yours truly,

WILLIAM BURNETT.

Tube Railways and Houses in their Vicinity.

To the Editor of The Builders' Journal.

London, W.C.

Sir,—Two of the most important points in regard to tube railways which must necessarily be carefully considered in the near future are—to what extent are these railways to be allowed to vibrate, and to what extent are the owners of such railways to be held responsible for the results of vibration?

A large number of buildings along the route of these railways has been damaged by subsidence. In a number of cases the walls have been broken throughout their entire height, while in other cases only plaster cracks in the walls and ceilings appear as yet; but what may we look for when the trains have been running in the "ordinary way" for, say, six months! Several owners and leaseholders have informed me that before taking any action in the matter of compensation they intend "to wait till the trains run," so as to determine whether the vibration increases the damage already sustained.

The question occurs to me, Can the railway companies be held responsible for increased damage caused by vibration, damage which would not have been incurred had the buildings been put in a proper state of repair before the running of trains?—that is, where no compensation has been received or where compensation has been received, but the time for reinstatement of damage has been insufficient to complete the work.

All buildings along the line of streets and highways vibrate to a certain extent, but the vibration, though sufficient to be felt and measured, will not necessarily injure the buildings whilst the foundations remain intact and the walls are homogeneous; but should the walls become cracked, then the vibration will soon show its evil effect.

The vibration caused by running trains will undoubtedly help the subsoil to take its bearing, and this subsidence will take place gradually, and may possibly in some localities extend over a period of, say, two years, according to the nature of the subsoil, &c.; so that if the companies are liable only for structural damage caused by the construction of their works, and if they are not to be held liable for any damage which may occur after repairing or compensating, then I can see that the leaseholder who is bound to "uphold and maintain" will be placed in a very awkward position, for at the time of compensating "future damage" is purely speculative and is not likely to receive much consideration or to be assessed at a full value either by the railway companies, juries or arbitrators, and the allowance made in such cases will in all probability be a minimum amount.

Is it possible then to make compensation specific, so as only to apply to such damage as could be proved at the time of acceptance and in no way to cover future damage? A fairly accurate check could be made, and a record kept of all damage sustained, by means of photographs, &c.

In the event of a tube railway passing near or under a leasehold site upon which the lessee is about to erect a new building considerably heavier than the existing structure (which we will assume has been damaged through subsidence), the freeholder having for a consideration granted an easement to the railway company subsequent to the granting of the lease, who would be responsible for the increased cost of foundations necessary on account of the resistance of the soil having been lessened? In "taking the land" the railway company also takes (for a term) part of the ground resistance, which may necessitate an increased area of the foundations to perhaps double; and as the lessee when entering upon his lease of the site is entitled to expect that he may erect any building within the meaning of the Building Act upon such site, it would seem to me unjust that he should be called upon to expend double the amount upon the foundations of the building that would have been required had no tube passed under or near his site.—Yours truly,

CHARLES R. MITCHELL.

Manchester Society of Architects.—About 450 members and guests assembled at the City Art Gallery, on Friday, February 27th, and were received by the President and Council. Selections of music were played during the evening by the Manchester Military String-band, and there was an interesting and representative exhibition of work by the members. Among the guests who accepted were Mr. Alfred Hopkinson, Principal of Owens College, Mr. David Morgan, President of the Cardiff, South Wales and Monmouthshire Society of Architects, Mr. A. H. Crawford, President of Edinburgh Architectural Association, Mr. S. Trevail, President of the Society of Architects, Mr. John Belcher, Vice-President of the Royal Institute of British Architects, Mr. John Slater, Vice-President of the Royal Institute of British Architects, Mr. J. Flew, President of the Bradford Society of Architects and Surveyors, and Mr. Arthur Clyne, President, Aberdeen Society of Architects.

Keystones.

A new Cathedral at Bombay is proposed to be erected.

The Restoration of All Hallows Church, near Rochester, which dates from Norman times, is now completed.

A Church at Summerstown, Tooting, is to be erected from designs by Mr. Godfrey Pinkerton. It will seat 800 persons and cost over £9,000.

Restoration of Welbeck Abbey.—All the floors have been or are being sound-deadened by means of fibrous pugging slabs supplied by Messrs. Frederick Jones & Co., of Kentish Town, N.W.

His Majesty the King has been graciously pleased to accept copies of the current issue of THE ARCHITECTURAL REVIEW containing Mr. MacColl's article on the Wellington Monument.

The Church at Westfield, near East Dereham, has been reopened after restoration and repair from plans by Mr. A. J. Lacey, F.R.I.B.A., of Upper King Street, Norwich. Messrs. J. Springall & Son, of Swanton Morley, were the contractors.

St. Peter's Vicarage, Southwark.—This work is being executed by Messrs. Vigor & Co., 10, Grosvenor Road, S.W., from the design of Mr. A. H. Ryan-Tenison, A.R.I.B.A., 12, Little College Street, Westminster, S.W., at a total outlay of £2,497.

Liverpool Cathedral.—The amount in hand and promised towards the cathedral scheme now exceeds £170,000. The designs being prepared by the six selected architects are to be sent in to the Committee by the end of April.

Technical Education in America.—The Principal of the Northampton Institute, London (Dr. R. Mullineux Walmsley), is being sent on a three months' tour to the United States and Canada for the purpose of investigating the present position of technical education in those countries and its bearings upon industrial production in the subjects covered by the technological work of the Institute, but more especially in the engineering industries.

The Aberdeen Society of Architects held its annual general meeting last week. Mr. Arthur Clyne, the retiring president, delivered a short address. The following office-bearers and council for the ensuing year were elected:—President, Mr. Arthur Clyne; vice-president, Mr. R. G. Wilson; hon. treasurer, Mr. John Rust; hon. secretaries, Mr. Rust and Mr. A. H. L. Mackinnon; members of council, Messrs. William Kelly, H. Maclennan, J. R. Macmillan, W. Ruxton and George Watt.

New Members R.I.B.A.—The following gentlemen have been elected Members of the Royal Institute of British Architects:—As Fellows: W. Ainslie, Sir Rowand Anderson, LL.D., F.R.S.E. (Edinburgh), T. E. Cooper, H. Davis (Scarborough), J. M. Henry (Edinburgh), W. Stirrup (Blackburn), W. A. Waddington (Manchester), J. H. T. Woodd, M.A. Cantab., A. W. Yeomans (Chard, Somerset). As Associates: R. Bennett (Buxton), W. E. Brooks, F. B. Chester, W. St. Leger Crowley (Cardiff), W. Greenwood (Blackburn), J. H. Higson (Blackburn), J. Holt (Wilmslow, Cheshire), C. H. Hopson (Canada), H. J. B. Hoskins (Birmingham), J. I. P. Jones (Cardiff), J. M. Lethbridge, T. F. Maclennan (Edinburgh), T. McLaren (Montreal), C. E. Monro (Glasgow), G. S. Nicol (Birmingham), C. E. L. Parkinson, F. G. Richardson, N. T. Salmon (Reading), S. Towse, W. H. Watkins (Bristol), H. White, F. C. Wrigley. As Hon. Corresponding Member: Constant Moyaux, Member of the Institute of France, President of the Société Centrale des Architectes Français, Paris.

The Metropolitan Public Gardens Association has just issued its twentieth annual report, for 1902, price 6d.

Competitive Designs for Municipal Buildings at St. Ives are to be invited, premiums of £70 and £30 being offered. The buildings are to cost about £6,000.

A Sepulchral Monument.—M. José de Charmoy, the author of the monument to Baudelaire, has been commissioned to execute the monument which is to be placed on the tomb of Sainte-Beuve.

Radley College Extension.—The house and wing designed by Mr. A. H. Ryan-Tenison, A.R.I.B.A., 12, Little College Street, Westminster, is to be carried out by Mr. S. Hutchins, 1A, Southmoor Road, Oxford, at a cost of £8,007. The work is commenced.

Business Premises at Cambridge.—The business premises of Miss Laurie and Mrs. Connal at Cambridge, lately destroyed by fire, are to be rebuilt immediately, and Mr. R. Frank Atkinson, of London, has been appointed the architect.

The Edinburgh Architectural Association paid its first visit of the session last Saturday week to the Usher Institute of Public Health, Warrender Park Road, by kind permission of the University Court and Prof. Hunter Stewart. The members were conducted over the building by Dr. Buchanan Young, in the absence of Prof. Hunter Stewart, and by Messrs. Leadbetter & Fairley, the architects.

Discoveries at Peterborough Cathedral.—During some excavations for underpinning the south wall of the sanctuary of Peterborough Cathedral, last week, three stone coffins, one very large and two small ones, and the stem of a Saxon cross richly ornamented with moulding of a well-known Celtic pattern, were discovered. The spot is the north-eastern extremity of the Saxon church which was destroyed by fire by the Danes, and probably formed part of a monastic burial-ground. The cross is to be preserved in the cathedral.

The Royal Institute of the Architects of Ireland held a meeting of members on February 26th. The president, Mr. G. C. Ashlin, R.H.A., occupied the chair. The president asked the members present to enter into a discussion as to how far the existing conditions of contract in their individual experience met the general needs of the profession. The proposed revision of the conditions of contract generally in use in Ireland is a matter which the council is very carefully considering. Mr. J. Rawson Carroll stated his views at some length, and was followed by Mr. Gilliland, Mr. Murray, Mr. Shaw, Mr. Orpen, Mr. Sheridan and others. Mr. Allberry moved a resolution in reference to the proposed initiative of a qualifying examination as a condition precedent to election to membership of the Institute.

Glasgow Technical College Craftsmen's Society.—At the usual meeting of this Society held on Friday night (Mr. C. Ernest Monro, architect, in the chair), Mr. James Lockhead, A.R.I.B.A., gave a lecture on "Belgium—Commerce and Architecture." The lecture which was illustrated by 100 lantern slides was descriptive of a tour through Antwerp Brussels, Courtray, Tournay, Louvain, Bruges and Ypres. The lecturer traced the expression of the rise of independence and growth of commercial prosperity in the architectural character of the public buildings. After showing general views of the towns he took up Town Halls, Cloth Halls, Belfries, Guild Houses, &c., in groups. He then showed a large number of typical gable treatments most of the illustrations being from his own sketches. On Saturday afternoon the members were shown over the new Central Stores (Messrs. Ernest Runtz & Co., architects) by Mr. Currie, clerk of works.

Tientsin Club Competition.—In a recen open competition for a proposed New Club Building for Tientsin, North China, ten firms of architects from China and Japan submitted plans. The Building Committee awarded the first premium of £120 to Messrs. Algar & Beesley, architects, of Shanghai, whose plans were considered best in merit and suitability. The estimated cost of the new building is about £20,500. The new building has been designed by Mr. Beesley in the Classic style, and has an imposing appearance. Externally, it is proposed to use grey Pekin granite with dressings of green Ningpo stone, the roofs to be covered with red Kiautchou tiles.

The R.I.B.A. and Registration.—At the last meeting of the Royal Institute of British Architects the president (Mr. Aston Webb, A.R.A.), referring to the circular recently issued by the Society of Architects headed "A Government Diploma for Architects," announced that the Council were still opposed to any such scheme of registration as that set forth in a previous Bill dealing with the same subject, but when the details of the proposed Bill were before them and had been duly considered the Council would be prepared to give their definite views as to the course to be taken.

A Masonic Temple at Hamilton, N.B., is being erected from designs by Mr. Alexander Cullen.

St. Bartholomew-the-Great, Smithfield.—The three remaining bays of the cloisters of the old Priory have now been purchased and a faculty obtained for connecting them with the church by means of the original monks' doorway, which, though at present bricked up, can still be traced in the wall of the south ambulatory.

Sir Rowand Anderson, LL.D., delivered a lecture recently before the St. Peter's Men's Union, Kirkcaldy, on "Some Phases and Types of Architecture." Discussing modern architecture and its future, he ventured the opinion that it was impossible we could have a new method, as all the possible methods of construction were known to us. Perhaps the most interesting point in the lecture was that in which he hit off the characteristics of some of Edinburgh's best-known pieces of architecture—the castle-like nature of the Calton Jail, which, as architecture, was a veritable sham. A castle, he remarked, was a place to keep people out, while a jail was a place to keep people in—showing the incongruity of the building as architecture. The modern "castle" was happily hit off as a "a costly delusion," and comparisons made between the old "keeps" and the modern castle-shaped residences.

* Accepted with modifications.

Moretonhampstead.—For the construction of sewers, manholes and disposalworks at Moretonhampstead, for the Newton Abbot Rural District Council. Mr. G. D. Bellamy, M.I.C.E., engineer, 6A Courtenay Street, Plymouth:—

W. C. Shaddock, Plymouth	£4,921	2	9
J. Shaddock, Plymouth	3,873	11	0
J. Dickson, Exeter	3,367	8	2
W. Brenton, Torquay	2,900	0	0
Hawking & Best, Teignmouth	2,776	5	0
E. Pike, Torquay	2,455	2	0
M. Bridgeman,* Paignton	2,428	10	0

* Accepted.

Norden (Lancs).—For laying a pipe sewer, 12in. to 21in. diameter, with manholes lampholes, &c., for the Urban District Council. Mr. J. W. Sunderland, surveyor:—

C. Kershaw, Rochdale	£8,0 6
T. Ashworth & Sons, Norden, Rochdale	4,454
T. Turner, Heywood	4,449
Bower Brothers, Halifax	4,270
J. Fletcher, Heywood	4,276
J. Moore, Rochdale	3,939
J. Poole, Littleborough, Rochdale	3,59[illegible]
R. Robinson & Son,* Rochdale	3,562

* Accepted.

Oxford.—For additions and alterations to 11 Winchester Road, Oxford, for Mr. D. R. Thomas. Mr. H. Quinton, architect and surveyor, 22 George Street, Oxford. Quantities by the architect:—

Wyatt & Son	£1,327	6
Simms & Son	1,250	0
J. Wooldridge	1 241	0
J. Peattie	1,228	0
Symon & Co.	1,197	0
Knowles & Son	1,139	0
Kingerlee & Sons	1,058	0

Rotherham.—For the construction of sewers, bacteriological tanks and filters, and other work connected therewith, at Thorpe, for the Sewage Works Committee. Mr. R. E. W. Berrington, M.I.C.E., engineer, Bank Buildings, Wolverhampton, and 28 Victoria Street, Westminster, S.W.:—

Jones Brothers, Stairfoot, Barnsley	£4,294
W. H. Reading, Wolverhampton	4,036
J. Cooper, Rotherham	3,790
R. Snell, Masborough, Rotherham	3,785
Graham & Sons, Huddersfield	3,529
W. R. Unwin, Ecclesfield, near Sheffield	3,368

Trade and Craft.

A Silicate-of-Lime Building Stone.

An exhibition of samples of the new silicate-of-lime stone, the invention of Mr. R. P. Ford, has been on view this last fortnight at 73, Coleman Street, E.C., and will remain open this week. It is a remarkably interesting collection, and certainly the samples show this artificial stone to the utmost advantage. They look exactly like natural stone, except they are more even in colour and texture. Several examples of carving are shown which prove that the stone is most even in working, and we are assured that the great defects to which all artificial stone made with lime by the application of superheated steam is liable—namely, the silication not being equally effected in every part, especially in the interior of the block, soft pockets being found—have been overcome by Mr. Ford by means of most expensive machinery; it being stated, in fact, that the five years' experimentation has cost £34,000. Samples of various tints, textures and hardnesses of the stone are shown, and one that has been exposed on a roof for three years to show it does not get dirty in a town atmosphere and that it weathers well. The variations in colour from a clear white to a warm cream or pink are obtained by using various coloured sands. Very large blocks have been obtained, one of the greatest difficulties in former attempts at this class of stone, some being as large as 6ft. by 3ft. The claims upon which the utility of this stone are based are briefly that it resists weather better than the natural stones, Bath and Portland; is even in colour and texture, and has a greater crushing strain. To a great extent this can only be proved by time, but excellent results have been obtained from tests upon small samples. The great element upon which the weathering capabilities of Mr. Ford's stone is based is that the cementing matter by which the grains of sand are held together is silicate of lime, upon the formation of which the good qualities of Portland cement and hydraulic or blue lias limes depend. Portland cement is not used in the stone to obtain this silicate of lime, but a hydraulic lime is hydrated first by hot water, superheated steam and pressure in a cylinder being relied upon to turn the free lime into the silicate by combination with the sand (silica). We are informed that fat limes can be used, but then the process takes longer, and presumably is not so efficient. The process, of course, is the old one, but Mr. Ford's invention consists in the machinery by which he claims to have overcome all the elements which produced failure in other stone. The samples which he shows are not loose in texture, with the consequence that they are not greatly porous and will therefore resist frost, one of the great destructive agents of stone. Mr. Ford was Her late Majesty's Attorney-General in the Transvaal when annexed in 1877, and the means by which he came to foresake his vocation as a lawyer for that of a maker of artificial stone is partly to be traced to the fact that he lent some money on a silica quarry at Ffrith, near Wrexham, some years ago with the idea of supplying silica for glass manufacturers. Belgian competition however, killed the venture, and then Mr. Ford become possessed of the quarry. Not caring to lose the money he had advanced, he set about trying to turn the venture into prosperous ways. He heard of the German system of making silicate-of-lime stone, and thereupon employed experts to advise on the question of adopting the German system at the quarries. A factory followed, and the stone was duly turned out, but it was found that large numbers of the blocks were cracked and flawed. Mr. Ford got rid of experts, and with the aid of a few other men experimented until he succeeded in turning out large, perfect, blocks of the silicate-of-lime stone, a result which is unattainable by any other manufacturer of the stone.

After all, the great thing is cost, and Mr. Ford states that the stone can be produced for about 4d. per foot cube, and sold for about 10d. as against 11d. for Bath and 1s. 6d. for Portland stone. The labour of working is about equal to Portland. Tests as to its strength show it about three times that of Portland, and it resists the action of acids better than Portland or Bath.

A Smoke-Curing Cowl.

When men were of oak and beds of straw the smoke found its way out of a hole in the roof, and nobody gave a thought to it: but time has changed things, and nowadays with men of straw and oaken beds we must have no smoke in our rooms. More especially the problem is a city one, and there are two aspects of it—the public and the private—for while it is nothing to the public that a man's room may be foul so long as his chimney does not smoke, the individual is equally indifferent whether his chimney belches forth volumes of smoke so long as his room is free from it. Perry's "Certainty" Smoke-Curing Cowl Co. is concerned only with the latter aspect of the question. The cowl is made in galvanized iron and in terra-cotta. The cost of an iron one 3ft. high without base, to slip into an existing chimney pot, is 21s., or 30s. for a 6ft. cowl with flange and straps: while, with base, the cost is 25s. for a 4ft. cowl and 33s. for the larger size: in terra-cotta, red or buff, the price is 25s. for one 3ft. 6in. high, with base. The cowl is not mechanical, and is therefore free from noise; it can be thoroughly swept by ordinary means, and is guaranteed to work satisfactorily in any wind. The company's offices are at 64, Finsbury Pavement, E C.

Drilling Square and Angular Holes.

A very ingenious and useful invention for drilling square and angular holes has been introduced to the English market by Messrs. Curtis, Gardner and Boxwell, Ltd., who will be glad to allow anyone to see it in operation at their London offices, 25, College Hill, Cannon Street, E.C. It is called the "Kinemat" apparatus and is an adaptation of the principle of the Cardan circles, but the distinguishing feature is that it can be easily and quickly applied to any ordinary drilling machine or lathe. The apparatus comprises a clamp carrying a drill-guide fitted to a spindle-bearing by means of screws and pawls. To the spindle-head a crosshead is attached and a steel plate screwed underneath to serve as a thrust-block for the drill. The latter is driven by another crosshead screwed to the drill itself and actuated by the spindle crosshead. As the drill continually changes its position with regard to the centre axis of the spindle, rollers are provided on the cross-head to reduce friction. The drill slides in a guide comprising two or more cheeks, which render adjustment easy. Two movable plates work in a groove on the borer guide and are provided with points corresponding with marks struck in the work to be bored; the points are placed thereon by regulating the cheeks; the boring will then take place exactly according to the shape of the guide. As a rule, the guides only require to be exchanged when the profile of the bore-hole is changed, but if the same profile is required it is only necessary to insert other borers or drills. The borer is so formed that its underside is sharpened after the manner of the cutter, whilst the lateral cutting surfaces are hollowed out; grinding can thus be easily and rapidly performed. The device is one that should meet with favour in trade circles, as it greatly facilitates the cutting of square, triangular, sexagonal and other-shaped holes in wood, stone, iron and other materials. As a time-saver it is computed that the apparatus will drill 120 holes in the time taken by a skilled artizan in cutting one.

Guaranteed Gearing

ROBERT ADAMS,
65 & 67, Newington Causeway, LONDON, S.E.

The Originator and Leading Maker of the Modern System of Ventilating Gearing.

HIGHEST AWARDS AT PARIS, 1900.

"ADAMS' SPECIAL CONTINUOUS GEARING"

used in most of the best known Public Buildings in the United Kingdom.

ILLUSTRATED PRICE LISTS ON APPLICATION.

FIFTEEN GOLD MEDALS AWARDED

Coming Events.

Wednesday, March 11.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Paper on "Electric Lighting of a Small House," 7.30 p.m.

INSTITUTE OF SANITARY ENGINEERS.—Meetings of Examination and Literary Committee at 3.30 p.m., General Purposes and Finance Committee at 4.15 p.m., Election Committee at 5.15 p.m., and Members' Sessional Meeting at 7 p.m. Mr. L. Aglio Dibdin on "General Municipal Engineering."

SANITARY INSTITUTE.—Discussion on "Sewage Disposal and the Qualities essential in a Sewage Effluent," to be opened by Mr. George Reid, M.D., D.P.H., 8 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.- Mrs. Traquair on "Decoration," 8 p.m.

SOCIETY OF ARTS.—Mr. T. Brice Phillips on "Existing Laws, By-laws and Regulations relating to Protection from Fire, with Criticisms and Suggestions," 8 p.m.

Thursday, March 12.

MANCHESTER SOCIETY OF ARCHITECTS.—Discussion on Students' Drawings.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Conversazione at the Galleries of the Royal Institute of Painters, Piccadilly.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Technical Demonstration on Electric Power and Lighting at Messrs. Egan & Tatlow's, 19 and 20 Fleet Street, Dublin, at 4 p m.

Friday March 13.

INSTITUTION OF CIVIL ENGINEERS (Students' Meeting).—Mr. A. R. Langton on "The Reconstruction of the Midland Railway Bridge No. 27, over the River Trent," 8 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—Messrs. A. D. Constable and E. Faussett on "Distribution Losses in Electric Supply Systems," and Mr. M. B. Field on "A Study of the Phenomenon of Resonance in Electric Circuits by the aid of Oscillograms," 8 p.m.

Saturday, March 14.

JUNIOR INSTITUTION OF ENGINEERS.—Conversazione at the Westminster Palace Hotel at 7 p m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Colinton Mains Hospital, by permission of Mr. R. Morham, City Architect.

ARCHITECTURAL ASSOCIATION.—Third Spring Visit.

Monday, March. 16.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. Charles Hadfield on "Westminster Cathedral," 8 p.m.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. Laurence Hobson, A.R.I.B.A., on "Ancient Churches of Wirral."

Tuesday, March 17.

SOCIETY OF ARTS (Applied Arts Section).—Miss Hannah Falcke on "Artistic Fans," 8 p.m.

GLASGOW ARCHITECTURAL ASSOCIATION.—Sir John Stirling Maxwell on "Contemporary Architecture from a Layman's Point of View," 8 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Mr. J. Schlentheim on "Mosaic," 7.45 p.m.

Wednesday March 18.

EDINBURGH ARCHITECTURAL ASSOCIATION (Associates' Section).—Mr. W. Davidson on "Church Decoration," 8 p.m.

Bankruptcies.

G. H. SHAW, plumber, painter, &c., Fenton, Stoke-on-Trent. Receiving order made November 4th, 1896. Liabilities £368; assets £65. Dividend of 3s. 4½d. in the £ paid and estate closed April, 1897. Discharge granted March 4th last.

T. TAYLOR, builder, Bengeworth, Evesham. A receiving order has been made in the Worcester Bankruptcy Court on the debtor's own petition.

JENNINGS & ROFFEY, painters and pagerhangers, Aston, Birmingham. Receiving order made February 27th and debtors adjudicated bankrupts.

R. PEAKE, painter and glazier, Aberystwith. Gross liabilities £856; £801 to rank as dividend; deficiency £527. Public examination and meeting of creditors held on February 27th.

A. J. WILLIMONT, builder and contractor, Yarmouth. Liabilities £4 055; deficiency £2,516. Public examination held on March 3rd and adjourned.

COCKRELL BROTHERS, builders, Gorleston, Yarmouth. Liabilities, £317; assets estimated to realise a similar amount. In the separate estate of W. G. Cockrell liabilities were returned at £1,006 and deficiency £242; and in that of J. W. Cockrell, liabilities £778 and deficiency £503. Public examinations closed March 3rd.

The Academy Damper. It has been stated that the number of works submitted to the Academy by outsiders is to be reduced from eight to two and those by members from eight to six; but this is somewhat premature. Resolutions to that effect, it is true, were passed at the general assembly held after the recent assembly, but these need to be ratified by a second general meeting of Academicians: and as the proposal is not by any means new, having been rejected some years ago, this is not a mere formal procedure. It is probable, however, that the stronger reforming element will effect the change, more or less as stated. Nothing of course will influence this year's arrangements. For ourselves, we are only interested in the architectural side of the question. About 250 drawings are hung in the architectural room at the Academy, and remembering that the total number of pictures hung is about one-tenth of those submitted, we might hazard that about 1,000 architectural drawings are sent in every year. Under the new régime we do not think there would be much change in the architectural room. But the hanging committee would be saved a great deal of trouble. We do not suppose there are many architects who submit eight drawings to the Academy, but four are often sent by men whose work has no chance of being accepted. A reform which is far more urgent than this is the admission of photographs, which provide the most accurate representations of buildings. Architects are concerned with what actually is: photography shows that. There may be drawings in addition, but the Academy does a great injustice by not admitting photographs in the architectural room.

The Decorations of St. Paul's. Sir William Richmond seems to think that he alone has made up his mind in regard to the decorations of St. Paul's Cathedral. He is proudly dogmatic about them; insists, very properly, on being allowed an absolutely free hand; has a fine scorn for the critics of the press and those whom he calls "sham classical gentlemen"; and made the stipulation before he commenced the work that his designs were not to be submitted to the approval of the British public. All this may be very well, and doubtless the task set is a vast and difficult one. But it is the general opinion of those in a position to speak that the decorations now being carried out in St. Paul's are not in the spirit of the building. Sir William may talk about the use of colour on European buildings, and he may jeer at the architecture which did not use colour. St. Paul's is of that architecture, the work of an Englishman and essentially English in feeling. Sir William's decorations are essentially Byzantine in feeling. Disconnected from the building, we admire them in part, but consider them quite inappropriate to St. Paul's. Sir William says he will be judged by posterity, and that if one hundred years hence his work is proved to be a mistake, then let it be hacked out. But the building is not going to be unharmed by that process; and we recall the fact that certain gross stencilling and cutting into the stonework which the artist thought proper has already been stopped by protest. The colour-scheme in the choir is harmonious, though we do not admire some of the details of its decoration—the angels especially—but the mosaics in the quarter-domes of the crossing are very discordant, and we equally dislike Sir William Richmond's windows. We grant him the difficulty of decorating so vast a building, but cannot approve them like he does himself.

Nesfield's Lodge, Regent's Park. At the head of the Broad Walk, Regent's Park, is a lodge which was erected in 1861 from the designs of the late William Eden Nesfield. When this lodge was built Nesfield's father was laying-out the Broad Walk as a garden, Mr. Cowper-Temple (afterwards Earl Cowper) being First Commissioner of Works and Buildings, and it was to this circumstance that the young architect—who had only recently returned from abroad—owed the commission. The lodge, which is of simple design, was a great favorite with its author, who made all the details with his own hand and cut off the ends of the pins of the window-frames with his pocket-knife in order to ensure that they should be uneven and look like mediæval work. The lodge cost £800, and Nesfield predicted at the time that it was the last job he was likely to get from the Government. The lodge is so unique that it is a matter of great regret to see the condition in which it has been allowed to fall for want of proper supervision. The bench in the open loggia which formed a striking feature in the original design has been removed, the loggia is enclosed with iron gates of a commonplace pattern, and the lights at the ends of the loggia are glazed with the abomination known as cathedral glass much patronised by church restorers. The roof has been mended in places with machine-made plain tiles, which do not weather like hand-made tiles and give the roof a spotted appearance; the cement fillets have been clumsily repaired; and to crown all, the whole of the external woodwork, which is of oak, has been painted a dirty brown colour. (Seasoned oak when exposed to the weather acquires a silvery tone and will last for centuries, but if painted soon decays.) Is it too much to ask the Government to pay a little more attention to this unique work of art, which, from neglect, is rapidly becoming dilapidated and in the near future will probably have to to be restored at great cost?

Concrete Houses. We notice that the Liverpool Corporation has decided to build a concrete tenement for the working-classes as a trial of their engineer's proposal; and we also notice that "one of the largest owners of cottage and other houses in the Kingdom" writes to a Liverpool newspaper disparaging the scheme, having tried it twenty years ago and discarded it. There is certainly nothing new about houses built of concrete. One may point to many lamentable failures in them, but there is no legitimate reason why they should not be satisfactory. A brick wall is considered under the by-laws as one-third stronger than a concrete one, which means that the latter has to be 12in. thick if the former is 9in. But that is a regulation based on bad workmanship. As a matter of fact, a properly-made concrete wall is stronger than a brick one—it has no beds, for one thing—but the by-law doubtless considers that garden mould and other rubbish may be regarded as fit material to mix for concrete. Houses built of that kind of concrete are not likely to be satisfactory; nor are houses which, instead of being built up regularly all around, are erected piecemeal, so that the walls become disjointed blocks. At Liverpool we may be sure no such methods will obtain. The idea is to build a three-storey tenement on a site in Eldon Street, each tenement comprising a living-room 15ft. by 10ft. 3in. and two bedrooms averaging 7ft. 4in. by 14ft. 9in. with a height of 10ft. Concrete made of crushed clinker from the refuse-destructors and Portland cement, with a small amount of embedded steel, will be used for the entire building, the cost of which is set down by the engineer (Mr. John A. Brodie, M.I.C.E.) at £1,230 and the site at £247 16s. Against this total of £1,477 16s. is to be set the rent of twelve tenements at 4s. a week each—£124 16s.—which, after deducting £50 for outgoings, will give 5 per cent. on the capital expenditure.

SOME CAMBRIDGE COLLEGES.[*]

By J. A. T. HOUSTON.

So few architects visit Cambridge as compared with Oxford that, whereas Oxford seems to be regarded as the architectural Mecca of England, Cambridge is treated as if it were of far less interest: yet, in my opinion, it is in no way architecturally inferior to its learned sister, and I confess to a distinct partiality for Cambridge.

Cambridge appears to retain much more of its mediæval collegiate character, has not felt the withering touch of the restorer so much, and is less changed by the hand of modern progress, which is so direful a thing for architecture—for, whatever we have progressed in since the days of Wren, Gibbs and their Gothic predecessors, a visit to such a town as Cambridge clearly shows it is not in the art of erecting beautiful buildings. The contrast will be the more pronounced if you visit some of the leading thoroughfares of London immediately afterwards.

Here in Cambridge we find, for instance, a dining-hall built just as the Gothic tradition was dying out, with high mullioned and transomed windows, open-timber roofs with one side of the exterior hidden from view by an erection of most developed Renaissance style (as at Trinity College), or, again, the well-known example of St. Mary's Church, Oxford, where Inigo Jones's beautiful porch is built on to the Gothic edifice. But in these days they did not trouble themselves in the least with styles which they did not understand, and rightly considered dead and decently buried, but built in the tradition that had been handed down to them and which they thoroughly understood.

Ancient Cambridge was situated wholly on the left bank of the River Cam, from which it took its name. Roman remains have been found in sufficient abundance to identify it with the Roman station Camboritum. The Normans built a castle on the same ground which the Romans had occupied, but this never appears to have acquired any great strength or importance; in fact, it is recorded as being in a ruinous condition as early as 1441, and subsequently it acted as a quarry for obtaining material for constructing and repairing some of the colleges. The gate-house, the last remnant, was demolished in 1842 in clearing the site for the county jail.

The religious orders early established themselves here. First the Augustinian priory of Barnswell was founded in 1112. The Franciscan House claims the year 1224 as its origin. The Benedictine nunnery of St. Rhadegund was founded in 1133. Two years later the Augustinians founded St. John's Hospital. The Carmelites founded a house in 1249. In 1257 the Friars of the Order of Bethlehem established themselves at Cambridge, and the following year saw the foundation of the Friars of Penitence or Sack. Then twenty-seven years elapsed before the Dominicans were founded. Fifteen years later (in 1290) the White Canons opened a house, and the Austin Friars in the same year.

The mediæval university in its original form was an association of learned men combined for the purpose of teaching, or in some cases a combination of teachers and scholars for their mutual protection, as, many of its members being foreigners, these became a prey to the extortions of the townsmen.

As time showed the benefits derived from the institution, and the educational and ecclesiastical advantages that accrued to the clergy, the university received royal and ecclesiastical authority and protection. The university or corporation so formed then received the sole privilege of tuition within a certain area or district, and no person could teach within that district without receiving the sanction of the university.

This university also obtained the power of conferring degrees on its scholars when they had passed through its curriculum and had displayed their abilities. This degree took the form of a public ceremonial, and is the foundation of the M.A. degree, and entitled the holder to teach.

At the formation of such a corporation its structural wants were few and easily satisfied. Its members required a place to hold ceremonies, teaching-halls and library. Existing buildings would be obtained, as the slender funds of the university would not allow of the erection of special buildings.

As the university gained age and strength it outgrew its primitive home, and special buildings became a necessity. The buildings themselves would naturally keep pace with the growth in numbers of the members of the institution and the increased range of the subjects taught within its walls.

A college, however, was primarily founded by wealthy benefactors for the housing and maintenance of poor students, and sprang from a humble beginning. The first college, founded in Paris, was endowed for eight scholars. At their inception these colleges, like the university, found their homes in the ordinary town dwellings of a humble and utterly unattractive exterior, and of incommodious and inconvenient interior.

KING'S COLLEGE CHAPEL, CAMBRIDGE: RIVER FRONT.

As the system was more widely used it seemed to commend itself to the mediæval philanthropist much the same as his modern representative bestows his favour on a public library. It had possibilities of popularity for the eminent churchman and courtier not thought of before These benefactors then considered their colleges lasting monuments to themselves, as ensuring their names being gratefully remembered by posterity; and the necessity for erecting buildings of a highly architectural and monumental character, such as they saw in the ecclesiastical work of the period, came to them as an inspiration.

As the development of the college by successive foundations revealed the type of building best suited to its needs, each new benefactor vied with his forerunner in the completeness and magnitude of his college. These colleges were each a complete community in themselves, governed by a code of rules, possibly provided for them by their founders and modelled in the monastic system.

The word "college" means a number of persons incorporated together for the prosecution of certain common purposes. In the thirteenth century dwelling-houses were known by the names of house, hall, inn or hospice. As I have already remarked, the first colleges consisted merely of dwelling-houses. The colleges in some cases retain the appellation of house or hall to this day.

The collegiate system owes its origin to the brain of Walter de Merton, the founder of Merton College, Oxford, Lord High Chancellor of England, and afterwards Bishop of Rochester. Merton devoted more than twelve years to the elaboration of the plans of his college in Oxford, during which period they were constantly changed as directed by acquired experience, which is always the case with all good and valuable work. Merton died in 1277, three years after the completion of his college, so that he did not long survive to witness the result of his toil and philanthropy. He must then have been seventy years of age, so that his plans represent the matured views gained by the experience of a long and active life. The first charter for the House of Scholars of Merton is dated 1264. This, then, is the formation of a university and its dependent colleges.

The majority of the Cambridge colleges have two or more quadrangles, the last facing the River Cam, along the banks of which and on the opposite side they have gardens, tennis-courts, &c. These are known by the name of "The Backs," the most delightful part of Cambridge.

There are sixteen colleges in Cambridge. I shall endeavour to give a brief history of the two principal ones, King's College and Trinity College; the rest I shall deal with in a very superficial manner.

King's College.

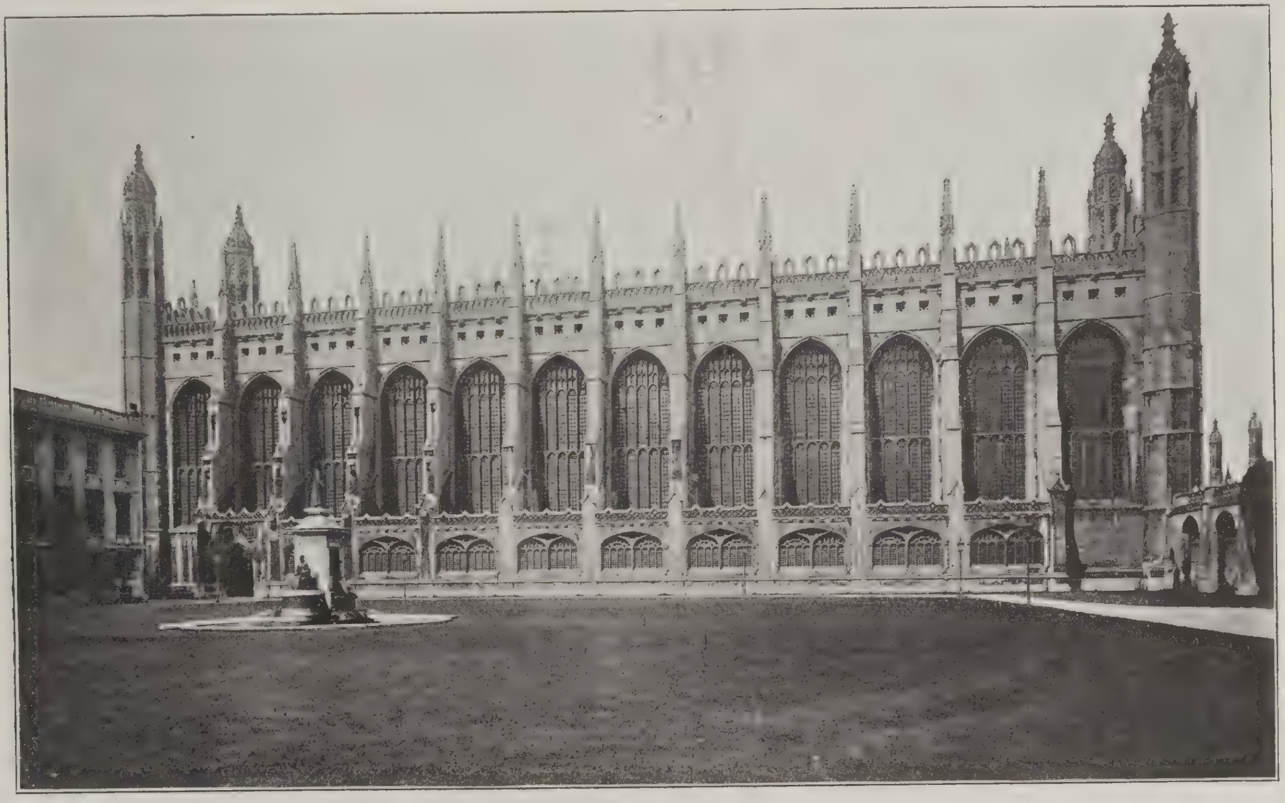
This college is rightly called King's, as it was founded by a king, and during the first three centuries of its life owed its maintenance and its growth to the kings of England, though in many periods of its history they were slender reeds to lean upon. The first beginning of this college that I can trace is by King Edward II. in the tenth year of his reign, July 7th, 1317, supporting scholars at Cambridge, the earliest notice of which occurs in a writ of that date commanding the sheriff of Cambridge to pay various moneys to "our dear Clerks John de Baggeshote and 12 other children of our Chapel at the University of

---

[*] A paper read before the Edinburgh Architectural Association on January 28th, 1903.

Cambridge." This benefaction developed into King's Hall. Edward must have endowed this college by the advice of some of his favourites, as he himself spent his days in hunting and his nights in revelry—probably it was done as a salve to his conscience, or perhaps as a thanks-offering, as the years immediately preceding 1317 were years of famine and plague.

The first building, called Old King's Hall, was erected on the site where University Library and School now stand. The old court, which had been sold to the University by the college, was (with the exception of the gateway) destroyed in 1835, as the University contemplated the erection of a new library on the site. They actually pulled down the old court of King's before they had a scheme developed even for its rebuilding. This act of vandalism brought down the righteous wrath of the community on their heads, which had the good effect of preserving for us the gateway. This building was commenced in the year 1441, during the reign of King Henry VI., who laid the foundation-stone in person. This monarch took the most lively interest in the college, and to him we owe that magnificent structure, the chapel.



KING'S COLLEGE CHAPEL, CAMBRIDGE: FRONT TO QUADRANGLE.

King Henry founded two royal colleges—Eton College and King's College, Cambridge. He gave the most detailed and carefully considered written instructions in regard to the building of both. These written documents are known by the title of "The will of King Henry VI." This is not of testament in the shape of a bequest, but merely what the king calls in his opening sentence "My will and mine intent," meaning his instructions and his desire. Three copies were made of this document. One is in the possession of Eton College, another is in that of the college of which I speak, and the royal founder himself probably retained the third and last copy. They contained a clear and well-considered plan for the foundation of both colleges, though, of course, with some differences required by the necessities of each case. The king closed his will with an appeal to his executors and assigns to carry out his wishes: but it is almost pathetic to think of his beautiful scheme abandoned and forgotten within a few years by all except the college authorities, who could do nothing for lack of funds.

Both colleges were commenced in accordance with the will, but neither was completed. At Cambridge the chapel alone, the gem of Cambridge, was begun by the founder, and in subsequent reigns entirely completed. To the south of the old court of King's lay a busy and thriving part of the town up to and including the year 1449. The king, however, had set his mind on acquiring this as a site for the new college which he proposed to build. He had agents in treaty for several properties the ground of which was much divided and covered with a labyrinth of streets. This naturally created many difficulties with the numerous proprietors and the Corporation, but these were overruled, and finally the ground was acquired in 1449.

The preliminaries having occupied a period of about eight years, the agents then commenced to clear the ground which forms the present noble site of King's.

King's College Chapel.

As I have said, the chapel was the only part of King Henry's design which was carried out, and it was not finished till fifty years after his death. From the accompanying illustrations some idea can be formed of what the appearance of the entire college would have been had it been carried out to the same high scale. The chapel was intended to be one side of a square, the other three sides being composed of chambers, library, &c. In the space to the west of the square, between the present Fellows' building and the river, there was to have been erected another quadrangle the dominating feature of which was to be a huge square tower rising high above the chapel.

The foundation-stone was laid by the king in person, with much pomp and ceremony, on St. James's Day, July 25th, 1446.

The country at this time was in a most disturbed and revolutionary state, as the Wars of the Roses had commenced—Henry himself lost his throne in 1461, and died a year later.

Among the several overseers of the works, the most prominent was perhaps a certain Robert Wordelake, whom they accused of embezzling the funds. History does not record whether this gentleman cleared his character at the time or not; but he left a document in the possession of St. Catherine's College proving his innocence and, in fact, making himself out as a benefactor to the college.

King Henry appears to have been very anxious to see his college completed, as when he was made prisoner by the Earls of Salisbury and Warwick, in the year 1455, he got them to pledge their word that they would provide funds for the building of the college, especially the chapel. This they did for a time (partly to gain his confidence), until the country was torn by civil war and payment stopped altogether.

The Earls were to pay £1,000 a year from the Duchy of Lancaster; this, however, was never paid regularly, as in four years only £1,000 had been paid. After the death of King Henry the work ceased for almost twenty years. The college, however, kept it in repair, and even struggled to carry on the work. King Edward IV. caused work to be resumed in 1477, but it did not progress much. Three years later (a year before the King's death) the work proceeded with greater activity, the monarch having promised 1,000 marks a year for three years.

Richard III. put a little more energy into the work, as in 1488 he granted letters patent to the overseer desiring "the building should go on with all possible dispatch, and directing him to obtain material and workmen, and authorising him to commit to prison all who should oppose or delay him."

There were no trades-unions in those delightful days.

The king appeared dissatisfied with the progress of the works, so he sent down his own plumber and glazier to hasten it, and there is a record of the college providing fish, capons, pigeons, rabbits and veal for them. The death of Richard III. caused a stoppage of the work for twenty-four years, and it was not resumed by Henry VII. till the year before his death, 1508. During this time about 140 workmen were employed.

UNIVERSITY LIBRARY CAMBRIDGE.

It is interesting to know the rates of their wages. The master-mason received £13 6s. 8d. a year; masons and inlayers 3s. 4d. a week; rough layers, sawyers, carpenters, 6d. per day, and labourers 4d. per day; and no mention of fish or veal for their entertainment, as the king's men had.

On March 24th, 1509, the king gave a sum of £5,000, which was all used by the beginning of 1512, when the late king's executors gave a further sum of £5,000, with a strict injunction to bring the chapel to a speedy completion. These moneys provided for the erection of the great stone vault, for the porches and sixteen of the chapels, and the four corner towers. There appears to have been quite a number of contractors on the job. One built one of the corner towers as a sample, for which he got £100; this was so satisfactory that he got the other three to construct.

The estimated cost of the great vault was £1,200. This (from the accounts) seems to have been greatly exceeded. So far as I can discover, the chapel up to this time appears to have cost £160,000. The stonework was entirely completed by 1515, having been sixty-nine years in building. The famous stalls and organ-case were executed between 1532 and 1536.

Other Buildings of King's College.

The idea of completing the college according to the will of King Henry VI. was never lost sight of, but the want of funds hindered the work, and nothing serious was done till the eighteenth century. However, in the year 1713, the provost, John Adam, set himself to gather funds and rigorously prosecuted the building scheme. He had an interview with Wren at Hawksmoor's house. Hawksmoor appears to have prepared a plan, perhaps under Wren's directions. The following is from a letter of the provost:—

> He (Hawksmoor) showed me ye upright model I did not like ye jetting out of ye pillars of ye portals, nor ye number of them, desired those might be but 4 clapt close on ye building, I think pilasters would still do better. I told him ye height would be majestic of itself, and in its plainness more answerable to ye chapel, and desired all ornaments to be avoided. The most expensive part will be ye Cloister. but it is ye hardest part for Mr. Hawksmoor to part withal.

Adam died in 1719, and this scheme fell through. Work was not started till 1724, when Gibbs superseded Hawksmoor as architect. Gibbs intended to complete the square, of which the chapel already formed one side, by three separate buildings, but the Fellows' building was the only one ever built. It was built of Portland stone at a cost of close on £12,000. The building was ready for the woodwork in 1729, by which time the funds were exhausted. It was two years later before the woodwork was ordered by Gibbs, who undertook to do it "as cheap as the nature of the work will allow." His fees were £300

There is little more to tell of King's College now. In 1822 the college again proceeded with its building scheme. For some reason they did not complete the quadrangle according to Gibbs's design, but held a competition, which was won by Wilkins. This consisted of a Gothic screen to the front of the court and a mass of Gothic buildings to the south. They also proposed to Gothicize Gibbs's building, a most extraordinary and objectionable idea. However, by the time the new buildings were completed the funds had gone down, and Heaven in its mercy thus prevented Gibbs's beautiful building from ruin. This completes the building operations at King's College. Wilkins's addition cost £100,000, so that altogether this College must have cost at least £300,000 during the several centuries of its erection.

Trinity College.

Trinity College was founded by King Henry VIII. in 1546. The site was then covered by two colleges, seven hostels and a number of other properties. It took sixty years to obtain. In acquiring one piece of ground from the Corporation of Cambridge the college had some squabbling with the superiors of St. John's College, as we read in an ancient document "that the Masters and Society of St. John's College do express themselves much grieved and dampnified therewith," and in order to allay their grievance they wanted from the Corporation "One little plot of ground." They do not seem to have got the little plot of ground, however, but at this juncture they very successfully bought from the Corporation their bowling green, so they had no longer reason to feel grieved and dampnified. Another piece of ground was gifted to Trinity by Dame Edith Chambre on the condition that the college would pray for Dame Edith's soul and the soul of her husband and all her relations' souls.

(To be concluded next week.)

Correspondence.

The Competition System.

To the Editor of The Builders' Journal.

Broughton-in-Furness.

Sir,—I have read with great interest your report of the last Architectural Association meeting, and particularly Mr. Bulkeley Creswell's remarks when viewing the competition question from the young architect's point of view. How, if Mr. Creswell's contentions are correct, is a young man just starting practice without influential friends and, very rightly, prohibited by professional etiquette from canvassing for work, ever to obtain a hearing? I am sure that there must be many young architects who will have felt, as I did, on reading Mr. Creswell's paper that if the opinions which he holds became a settled policy, only those persons just entering the profession who were backed up by influential friends could ever hope to be allowed to obtain a hearing; surely a much greater evil than any which the present competition system, faulty as it is, can produce.—Yours truly,

JAMES CROSSLAND.

THE DECORATION OF ST. PAUL'S CATHEDRAL.

Sir William Richmond on his Defence.

SIR WILLIAM RICHMOND, R.A., delivered a lecture last week on "The Decoration of St. Paul's Cathedral" before the members of the Institute of British Decorators. He said that his discourse would partake rather of the nature of a *causerie* than of a lecture. He stood there as a fellow-student who had tackled, no doubt, a very difficult task, and done it to the best of his ability. They all knew how many differences of opinion there must be with regard to matters of taste. Time alone settled the position which any work of art was to achieve and hold. If what he had done in St. Paul's was proved to have been a mistake 100 years hence, all he could say was he hoped they would hack it all out.

Up to the period when what he was inclined to call sham classical became the fashion all over Europe the churches in Great Britain and France and Italy were decorated with colours. It was the introduction of a noble style—the Palladian—which drove colour away. Therefore he was in a sense taken on the hip when he proposed to colour, frankly colour, a Palladian building, and to use colour, he hoped with discretion, but also lavishly. He was told by a great many people that it was an impossible nut to crack, and he said that if it was impossible he would crack it.

They knew that at the time of the Prince of Wales's recovery from his severe illness a sum of money had been collected for the decoration of St. Paul's Cathedral. That sum of money amounted to something like £100,000, out of which about £30,000 was wasted by the authorities in experiments. When he told them that to put up a scaffold underneath the great dome cost between £800 and £1,000 they could imagine that one did not particularly want to make any more expensive experiments with the residue of the money collected.

His views respecting a scheme of decoration for St. Paul's were absolutely decided before he was asked even to consider the decoration of the cathedral, and they were decided in a very curious way. When he was a little boy of about thirteen his mother took him to hear the service at St. Paul's, and they sat in the choir. He looked up at that naked roof—that was before he had ever been in Italy or seen a piece of mosaic—and on going out he said, "Mother, some day I will cover that with mosaic." When he was nineteen he made his first visit to Italy, and said to himself then, hard on forty years ago, "I will now begin to prepare myself for the great task that may some day come to me." He visited, and he had visited since, all the churches covered with mosaic in Italy, many in Asia Minor, and all in Greece; so that in that sense he was prepared, at any rate, to think about the decoration of St. Paul's.

There was a meeting of the Committee, and he made up his mind to two things, which he would stick to absolutely—one was that the work should be carried out by Englishmen, and not Italians; and the other was that he would have nothing to do with that odious modern invention, paper mosaic. All work which was *appliqué* could be done anywhere by one who had perhaps never seen the building in which it was to go. The axiom of all axioms which he would go to the stake for was that all decorative work should be done, if possible, *in situ*; and after the enormous experience that he had had in covering more or less 15,000 sq. ft. of wall he knew that the axiom was worth going to the stake for, because it was absolutely impossible to tell, excepting on the spot, how colours or even forms were going to appear in given circumstances.

He accepted the commission, and said that they must first of all see how he was going to design the choir. He therefore made drawings for the spandrels in water-colour, and took them to the cathedral. His scheme was unanimously passed so far.

Then he said that they must understand one another absolutely in one particular—he was not going to submit his designs to the approval of the British public. He knew the British public, and he knew the British critic. He knew that the British public had not made up its mind in the least degree as to what it liked, and it was for the artists and decorators to make up the minds of the public as to what they were going to have. Also, that the band of gentlemen, admirable writers sometimes, who constituted the critics in the Press had not made up their minds either as to what they liked or did not like. They would find one set praising up one class of work, and another set demonstrating its follies, another set advancing current fashion, current opinions, and another set saying that these were all wrong. He determined that he would not submit his work to penmanship.

THE FELLOWS' BUILDING KING'S COLLEGE, CAMBRIDGE: CENTRE PORTION OF RIVER FRONT.

It was therefore decided that a small committee should sit, and that he should, in a sense, be the chairman of that committee, because he did not intend to alter any design of his own excepting from the point of view of either ecclesiology or archæology. He said, "You must trust me as the artist. I am supposed to know my business. If I make a failure of it, there is always Waterloo Bridge and the Thames." (Sir William Richmond then proceeded to give a detailed account from a technical point of view of his work on the decoration of the cathedral.)

The mosaics were made by Mr. Powell, of Whitefriars, and they are, Sir William thinks, equal in every way to the Greek specimens he brought from Italy. The method of training the executants is interesting. Sir William Richmond built a large studio in his back garden, and between eight in the morning and eight in the evening he trained his nineteen young men and boys—some of them almost novices—to execute some of the mosaic work from his drawings. After four months of toil he produced two large angels. They met with the approval of the committee, who told him to go on. "I executed," he said, "no fewer than 3,500 drawings, and after a couple of years my young fellows worked so dexterously that I can say that I have never seen such fine mosaic work in any country in the world as my Englishmen executed in those four quarter-domes in St. Paul's. We have no business any more to say that Englishmen are not artistic. What we call the lower class of Englishmen are full of taste. They only want good guiding, kindness and gentleness, for they are very sensitive creatures and very shy."

Sir William described his work as building pictures in brick, and then ventured to criticise the huge prophets in the south-east dome of the cathedral. He admitted that they were very fine designs, but he said they ought never to have been executed in mosaic. They ought to have been painted in oil colours. The style, he said, was caught in Italy, where a good many things are caught. The prophets were copied from St. Peter's, Rome. "Severity," he said, "is the mother of mosaic; simplicity its father; and without those two conditions—unless you accept those two conditions—you had better never touch it. I made a great many mistakes, but I never made the mistake of being too severe. I have made the mistake of being too complicated. It is no use to copy Nature. You must have learned Nature, and have Nature at your fingers' end, but you must know that lesson which comes to us late in life—what to leave out."

The necessity of keeping the colours separate and how tints are affected by light were points adverted to. "I started with thirty colours," said Sir William. "I reduced them to fifteen, and finally to five. I got my variety by using the five colours dexterously. In order to produce white I had to use yellow. Had I used white it would have looked sky-blue." Sir William gave several instances of how tints differed owing to the peculiarity of the environment, one being that in order to produce white he had to use blue, red and yellow.

"I am finishing one phase of one aisle," he said, "and it will be opened before very long, and that will give an example of the manner in which I should like some day to treat the two aisles." Finally Sir William ridiculed the contention that "our noble art should stand alone." "It never did," he said with emphasis. "It is a most absurd and ridiculous position to take up. From the first colour was introduced into buildings. The Parthenon was entirely coloured. Every Norman church in England was painted from top to bottom, and at this moment there are over 2,000 churches in this country, notwithstanding the abominable Puritans and Iconoclasts, treated with colour. The time was when England had a greater number of painted churches than France. Until you get architect, sculptor and painter to work again in common, you will never get art in its broad, big, noble sense back into this country. That has been the foundation of all I have done at South Kensington, that the young fellows there shall not limit themselves to one art. Let them learn to execute in concert, and each will learn of the other. That is the way we shall get art back into this country."

EDINBURGH ARCHITECTURAL ASSOCIATION.

At last week's meeting of this Association Mrs. Ramsay Traquair read a paper on the subject of "Decoration." First, with regard to the attitude of the decorator, she said the architect came first, paving the way and creating the decorative artist. It was the architect who must give the favourable soil and atmosphere in which the decorative worker sprung to life. Decoration should become a sort of natural growth, and was only good in its proper place; taken out of that place, it would be a beautiful fragment, but it was only a fragment. She spoke of line as a means towards expression, and pointed out that the Greeks always gave prominence to the angle when they wanted activity, and gave prominence to horizontal and vertical lines when they wanted quietness. The relations between line and colour and the uses of line and colour in decoration were touched upon, and it was pointed out that a flat tint corresponded with a straight line, a graduated tint with a curved line, and broken colour with an angle. She emphasized the importance of the inferior parts of decoration being designed as carefully as the principal parts, and of not being given to inferior hands, otherwise the principal parts were apt to look like pictures in more or less unconnected surroundings.

MANCHESTER SOCIETY OF ARCHITECTS.

The last meeting of the winter session of this Society was held on Thursday evening last. The prizes were distributed by the president, Mr. Alfred Darbyshire, to the students who had been successful in the various competitions of the past year. The names of the winners of the last competitions were announced as follows:—For the design for the cover of the new Sketch-Book, Mr. J. Harold Gibbons. Mr. Holden's prize for a design for a free library, Mr. Harry Moss; the monthly class of design for a market hall, Mr. Harold Hill and Mr. C. H. Potter bracketed equal A paper was then read by Mr. Isaac Taylor on the students' work of the past year. The drawings, about sixty in number, were hung on the walls. Mr. Taylor said the Society gave about £40 a year in prizes to be spent in books, so that, besides the useful training, here was an excellent opportunity of establishing a first-class library. A further prize of £5 5s was this year offered by Mr. J. W. Beaumont for sketches and measured drawings suitable for publication in the Sketch-Book. Turning to the sketches exhibited, Mr. Taylor, whilst realizing the value of artistic sketching, thought that an architect's sketch-book should have far more outline diagrams, with sketches to large scale, of details and mouldings. There should be less of the photograph-like general views that students were so fond of making. The importance of measured work was also insisted on. The lecturer then gave a short criticism on each of the drawings. Mr. J. W. Beaumont, in proposing a vote of thanks, spoke of his great interest in the forthcoming issue of the Sketch-Book, and pointed out that it rested with the students to make it successful. Mr. H. B. Laycock thought that some of the conditions for the competitions should be more explicit, instancing the cottage hospital, where it was not stated whether day-rooms, operating rooms or accident ward were to be provided. Mr. Salomons also spoke and the lecturer briefly responded.

A Clock Tower at Torquay has been erected as a memorial of the late Squire Mallock, one of Torquay's benefactors. It takes the form of an Eleanor Cross, and was designed by Mr. John Donkin, F.R.I.B.A., of Albert Buildings, Queen Victoria Street, E.C., and Old Christchurch Road, Bournemouth. The carving was executed by Messrs. Harry Hems & Sons, of Exeter. The general contractors were Messrs. Bovey & Son, of Torquay.

GATEWAY ST. CATHERINE'S COLLEGE CAMBRIDGE.

Construction Notes.

Fixing Tiles. The general custom nowadays seems to be to use copper nails for fixing tiles or stone slates, that is, in work where some little pretension is made to doing the thing well. Of course a speculative builder uses the cheapest thing he can get hold of so long as it lasts long enough for him to sell the house, and he may use iron nails unprotected or perhaps coated with tar. If he adopts galvanized iron nails he no doubt considers he is doing the thing handsomely. But let the conscientious architect avoid being misled into using them by the persuasive builder. Zinc or composition nails are better—but not good enough. Wooden pegs seem to have gone out, but they were fully as good as iron nails. In some ancient buildings the tiles were fixed with splinters of bone, and excellent they were for the purpose. And now another instance has recently been offered by a writer in the daily press of an old building at Mansfield which was a good many years ago roofed with stone slates fastened with hundreds of the prongs or tynes of the antlers of deer. They were pegged into holes pierced in the slabs—two to each slate—in the ordinary way. Their use was evidently traceable to the ancient builder's desire for quaintness. It is these little tricks and fancies of the old workmen which more often than not give the quaintness and charm to old country houses so much admired by all our architectural students. All the striving after effect so characteristic of to-day does not make up for the interest we derive from the evidences of the loving hand and thoughtfulness and resource of the craftsmen of old.

Exhibit of Irish Minerals and Building Stones. The Department of Agriculture and Technical Instruction for Ireland have placed on view for a period of three months at the Imperial Institute, London, the extensive collection of Irish minerals and building stones which formed one of the most interesting and valuable of their exhibits at the recent exhibition in Cork. The exhibit embraces samples of the varied and excellent building materials and marbles in which Ireland is particularly rich, and the opportunity of examining these samples will be of the utmost advantage to all engaged in the building trade. The beauty and excellence of the Irish granites, sandstones and limestones, as well as of the red, green and black marble and the other ornamental stones of the country, are well known, and when shown at the Department's exhibit at Cork excited the admiration of all who saw them. The exhibit also includes specimens of clays, cement-making materials and fine sands. In the mineral section of the exhibit are a series of prospectors' samples of the metalliferous deposits of the country and samples of Irish coal and other minerals now being worked. The mineral expert to the Department will remain with the exhibit during the period mentioned, and all enquiries should be addressed to Mr. E. St. John Lyburn, F.G.S., Irish Mineral Section, Imperial Institute, London, S.W. The collection is a very large one, and shows that Ireland is exceedingly rich in building materials which have an individual character unlike any others. There are several reasons which, combined, have prevented them being worked to any advantage and used largely in England, or even in Ireland itself. First and foremost of these reasons may be placed that of insufficient capital to work them cheaply and on a big scale and push them; secondly, insufficient or no means of transport; and, thirdly, may be placed ignorance on the part of the building trade of the variety and excellence of the materials and

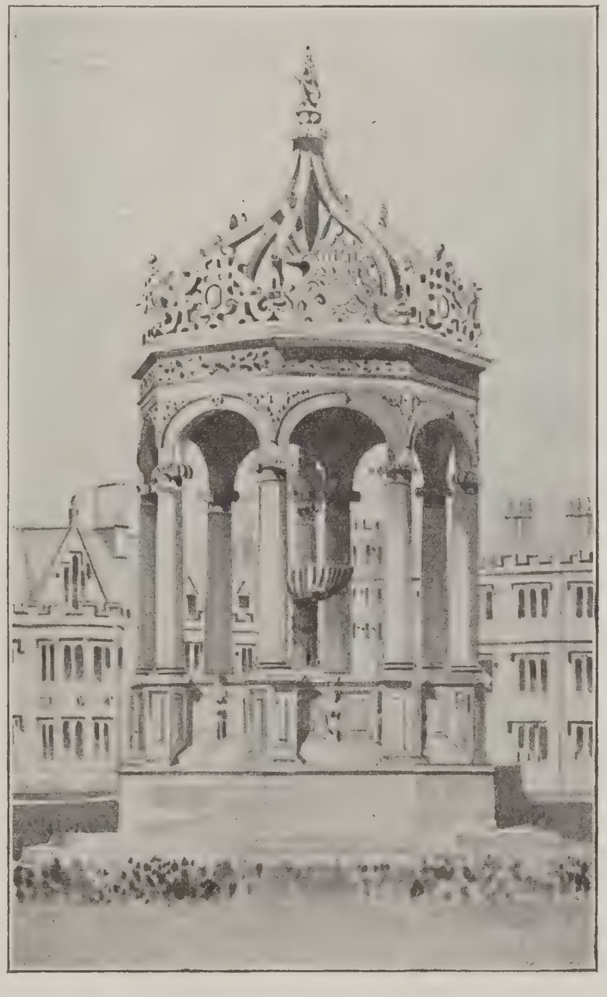
of the firms who supply them. This exhibition affords an opportunity for remedying n some part the latter, and may serve to attract some of the much-needed capital into these Irish industries. The apathy of the Irish themselves is really remarkable—there are mines having very large seams of excelent coal that are worked in a small local way, but simply for the reason that the railway is about six miles off they cannot be obtained at any distance profitably. If they could, as they should, the large deposits of ron and copper ore could be worked on a arge scale, and a tide of commercial prosperity set in for that unfortunate country. What is needed is a number of light railways o the main lines. This want of transport applies still more strongly to quarries. There are immense quantities of granite of all kinds —some that cannot be beaten by any in Scotland—unworked, notwithstanding the cheapness of labour, simply because there are no means of transport, whereas sufficient granite cannot be supplied from Scotand and Guernsey, and we actually are supplied with large quantities from Norway for such ordinary purposes as road-making. The same thing is noiceable in quarrying—the old hand methods are still followed, very little machinery (and that only in the largest quarries) being used. This, of course, s partially due to want of capital, but part is due to conservatism. The Irish marbles have been used in this country o some extent—the famous Connemara green being the best known—but ignorance of their wonderful variety has prevented their being used o anything like the extent they ought o be. Many foreign varieties are imported into this country from France, Norway and Italy that are far nferior to similar Irish varieties—ndeed, several of the famous ancient marbles of Italy are excelled in figure and colour by the same Irish varieties. There is an immense block of green Connemara marble from the Dublin museum shown at the exhibition which s most glorious in colour and marking. From the same quarries of the Irish Marble Company (Richard Colles) at Kilkenny as the green comes from are upplied beautiful black, red and white marbles. Another exhibit that takes almost equal rank is that of Lord Midleton, of the Midleton Red Marble. There are numerous samples at the exhibition of limestone of a peculiar latey, grey-black colour that seems to be prevalent in the country. The Ballinasloe limestone exhibited by Mr. P. Sheridan, of 23, Westland Row, Dublin, is grey-black and takes a polish well. Mr. Quinn, of Mount Charles, co. Donegal, shows a sample of a very fine cream sandstone, even in exture, which carves admirably and weathers very well, that has been partly used in extensions to the Dublin Museum. Numerous examples of slates are hown, but they by no means exhibit the wealth of the country in this respect. Probably the best slate in Ireland is the dark-grey from the Ormonde Slate Quarries, Carrick-on-Suir, co. Waterford, which is every bit as good as any of the Welsh. The Victoria Slate Co., at the same place, supply a blue and a pale-green slate that are very pleasing, and the Madranna Slate Quarry Co., Leap, co. Cork, supply a peculiar shiny dark black slate that cleaves in thin plates, and gives pleasing results if judiciously used. The exhibition is open free to the public between the hours of eleven and five. Admission is by the east public entrance of he Imperial Institute. The collection is, unfortunately, placed in a gallery where it is badly lighted. H. K. D.

Bricks and Mortar.

Aphorism for the Week.

Taste is only to be educated by contemplation, not of the tolerably good, but of the truly excellent.—GOETHE.

Our Plates. TRINITY COLLEGE LIBRARY, Cambridge, is dealt with in the concluding part of the article on "Some Cambridge Colleges," which will be published in our next issue.—St. Mary's Church, Beverley, was originally a chapel attached to one of the altars in the Minster and exhibits peculiar alterations and enlargements which have changed it from a twelfth-century church into what appears at first sight to be a great fifteenth-century parish church. The Minster, on the other hand, as Mr. John Bilson, F.S.A., observes in his article in THE ARCHITECTURAL REVIEW for April, 1898, may be said to be the result of two great building efforts—the first including the whole eastern arm and transepts (a new design on a grand scale practically uninfluenced by any previous buildings), and the second the completion of this design after a considerable interval. The great east window of the Minster was inserted in 1416, and contains the only mediæval glass which has survived in the fabric: parts of the lower lights are thirteenth-century work and parts of the following century, but almost all the upper part of the window is glazed with the original fifteenth-century glass.

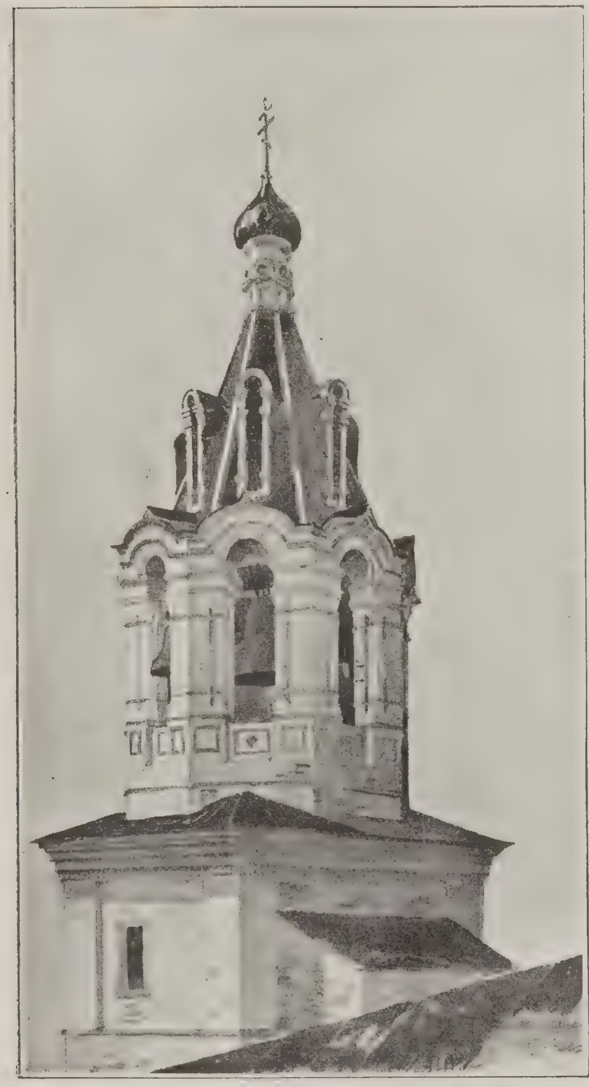


THE FOUNTAIN, TRINITY COLLEGE, CAMBRIDGE. (ERECTED 1602, REBUILT 1716.) DRAWN BY J. MYRTLE SMITH.

London's Supply of Water. THERE evidently is a copious supply of water for London in sources which are not as yet used or explored. Messrs. C. Isler & Co., artesian engineers, Bear Lane, Southwark Street, have tapped a copious supply of water at Messrs. C. Hammerton & Co.'s Brewery, Stockwell, where an artesian bored tube well, 11½in. in diameter, 400ft. deep, has just been completed by them through varying strata. The result which has been obtained is all the more remarkable considering that expert opinion seems to incline to the belief that the water-level in the London basin is lowering to such an extent that in a few years the water from the chalk stratum will be exhausted. Such, however, is not likely to be the case. The supply from this artesian bored tube well is raised by means of an improved system of compressed air, which dispenses with all pumping machinery, and the minimum yield is 320,000 gals. per day. The water-level remains the same when pumping as before pumping, showing clearly that strong underground springs exist in this part of London.

Proposed Restoration of Culross Abbey. ALL that remains of the ancient Abbey of Culross, which it is now proposed to restore, is the choir and the central tower and some fragments of aisles and chapels. The choir is occupied as the parish church, and entrance is obtained through the tower. The old cloister court in which the monks were put to flight by the Reformers is occupied as a garden, but visitors find much that is interesting in the ruined walls. The groined roof and arches of the great hall always command attention, and in the vaulted passage which leads through a Norman doorway are fine examples of the architecture of the flourishing days of Scottish monasteries. The old choir of the abbey, as Mr. David Beveridge, the author of "Culross and Tilliallan," rightly puts it, has been so "much metamorphosed in the course of the alterations which at different times it has undergone" since it became the parish church, that it is difficult to understand the original construction of the building. A magnificent specimen of an Early English window is obscured by a gallery and a staircase. It is proposed to remove the south and the east galleries, and to provide sittings for the accommodation which would be lost by the opening up of the arches, and the re-erection of the aisles on the south and the north aisles. "The Glasgow Herald" says that repairs involving a cost of £2,000 are absolutely necessary if the building is to be kept in a half-decent state of repair, and the heritors have pluckily come forward and guaranteed this amount. Sir Rowand Anderson estimates that the carrying out of his entire scheme would involve an expenditure of £5,000, so that £3,000 will need to be made up by subscription. The sum of £3,000 is too big an expenditure for the people of Culross, who are not heritors, and this accounts for an appeal being made to the people of Scotland, and especially to the city of Glasgow. Sir Rowand Anderson proposes to purge the building of its internal architectural vagaries. The work can only be done if help comes from without.

Mr. Bodley and Peckitt's Glass at Exeter. IN reference to the proposal to remove Peckitt's glass at Exeter Cathedral and to replace it with other glass as a memorial to the late Archbishop, Mr. G. F. Bodley writes to the "Times" as follows:—As architectural adviser at the cathedral of Exeter I have been asked to answer the objections raised against the removal of the glass now in the west window. . . . I feel sure that it cannot be generally known what a disfigurement the glass is to the beautiful interior of the cathedral. Painted at a time when glass-painting was a dead art, this window is entirely worthless. In colour it is most inartistic, and in drawing it is beneath criticism. Indeed it is utterly without merit. The glass, so cruelly crude and harmful to the beauty of the building, seems to pervade the whole interior, to its great detriment. It has not age to make it venerable, and certainly not any art to make it desirable that it should be retained. It is the work of Peckitt, a glazier who patched the old glass at York Minster. His work there, too, is most objectionable. The glass in the rose window and the lancets of the south transept in Westminster Abbey has recently been removed and new has taken its place. But the glass here was not so bad as this window at Exeter. It is true that the glass may mark a period of bad art, but that is hardly a sufficient reason for letting it remain when an opportunity offers for filling the window with better work, more worthy of the cathedral.



A MOSCOW BELFRY. DRAWN BY PERCY E. NOBBS. M.A., A.R.I.B.A.

A Moscow Belfry. The small belfry illustrated on this page from a coloured drawing by Mr. Percy E. Nobbs, M.A., A.R.I.B.A., is opposite the general post-office at Moscow, and dates from the end of the seventeenth century. The roof is of sheet copper surmounted by a gilded one. The brickwork is plastered and white-washed, the projecting string-courses being tinted grey.

GREAT THEBES.

Discovery of a New Royal Tomb.

In the "Times" last week the discovery was announced of the tomb of one of the Pharaohs of the eighteenth Dynasty, Thothmes IV. For the last two years Mr. Theodore M. Davies, an American, has been excavating steadily and systematically in the Valley of the Tombs of the Kings at Thebes, clearing the rubbish away inch by inch, and so laying bare the bed-rock. He has been rewarded this spring by the discovery of a previously unknown royal tomb. The actual discovery was made by Mr. Howard Carter, the Inspector of the Monuments of Upper Egypt, who has been conducting the excavations for Mr. Davies, and it is to his care and practised skill that we owe not only the preservation of all the objects found in the tomb, but also a scientific record of the conditions under which they were discovered. The tomb itself, like the other royal tombs in the same valley, consists of a gallery cut into the heart of the mountain. After sloping downward for a considerable distance, it is interrupted by a deep square well, on one of the walls of which is a band of paintings. On the further side of the well the passage turns back upon itself, and finally opens into a large chamber, at the extreme end of which is a magnificent sarcophagus of granite covered with texts from the Book of the Dead. On either side are smaller chambers. Clay seals with the name of the king had been attached to the doors of the chambers, and it is interesting to observe that the Egyptians of the eighteenth Dynasty had already to some extent anticipated the invention of printing, the raised portions of the seals having been smeared with blue ink before being impressed upon the clay. The walls of a chamber which served as a vestibule to that in which the sarcophagus was laid are adorned with a few paintings, and on one of them is a hieratic inscription, dated in the eighth year of Hor-em-heb, and stating that the tomb had been plundered by robbers, but restored as far as possible by that Pharaoh. The great and unique find, however, has been that of the actual chariot which was made for the Pharaoh, and in which he rode at Thebes. The body of it alone is preserved, but in a perfect condition. The wooden frame was first covered with *papier-mâché* made from papyrus, and this again with stucco, which has been carved, both inside and out, into scenes from the battles fought by the Pharaoh in Syria. The art is of a very high order, every detail being exquisitely finished and the faces of the Syrians being clearly portraits taken from captives at Thebes. The chariot is, in fact, one of the finest specimens of art that have come down to us from antiquity, and that it should have been made for the grandfather of "the heretic king" lends to it additional interest. Along with the chariot was found the leather gauntlet with which the king protected his hand and wrist when using the bow or reins.

Builders' Notes.

Mr. A. K. T. Buckley, of the firm of Buckley & Bowden, Durban and Johannesburg, builders' merchants and agents for building specialities, is at present in London looking for fresh agencies in the building trade, and is residing at 25, Maddox Street, W.

Concrete Floors.—The tender of the Columbian Fireproofing Co., Ltd., 37, King William Street, E.C., for concrete fireproof floors, roofs, coal bunkers, &c., at the electricity generating station at Ipswich has been accepted by the Ipswich Corporation, and the work has been commenced. The architect is Mr. C. Stanley Peach, F.R.I.B.A. We understand the steel works of this company at St. John's Wood are now rapidly approaching completion.

The L.C.C. Works Department and its Estimates.—In the course of his recent speech at a London Chamber of Commerce dinner Lord Avebury, referring to the Works Department of the London County Council, said: "We sometimes see it stated that works have been carried out below the estimate, and it is implied that there has been a saving. But who makes the estimates? If you put your own estimates high enough it is easy to do the work for less. Let me give you a case in point. The following letter is from Mr. R. Clutton, the great land agent: 'Dear Lord Avebury,—Referring to our conversation the other day, the facts as to the estimate given by the Works Department of the L.C.C. for constructing vaults at Knightsbridge in connection with the widening there are as follows:—The estimate of the Works Department for the brickwork for these vaults was £28 per rod (on cement). The Office of Works jobbing contract for the same description of work, whether in the basement or on the top of a high building, is £19 2s. per rod. This, in my opinion, would make £18 per rod, a very good price for vaults, but even taking the £19 2s. as a basis the difference is quite absurd.'"

Proposed Reductions of Wages in the North.—We learn that the Tyne bricklayers' labourers and other labourers employed in the building trade—with the exception of those engaged in plastering work—have received notice from the master-builders of a reduction in their wages of ½d. per hour, to take effect on September 1st. The present rate of pay is 6½d. per hour. The Tyne bricklayers, joiners and masons have received notice of a proposed reduction of 1d. per hour in their wages. In each case the present wage is 10d. per hour. In the cases of the bricklayers and the masons the reductions are to come into force on September 1st. In the case of the joiners, June 1st is the date fixed. The employers further require a number of alterations in the rules under which these trades work. They desire that all future notices of reductions, &c., should terminate either on May 1st or November 1st. The present rules are so worded that notices may terminate between April 1st and September 1st. As to the masons engaged in stonework—"banker work"—the masters desire that their working day should be extended from eight to nine hours. With regard to overtime, the employers desire for all classes affected by the proposed reductions and alterations that overtime should be paid time and a quarter for the first four hours, instead of time and a quarter for the first two hours and time and a half thereafter, as at present. Similar notices have been served on all the operatives in Middlesbrough, the Hartlepools, and the Tees. Some of the trades affected are giving notice of a counter-claim for an increase in wages to come into operation on September 1st.

R.I.B.A.

Mr. HADFIELD ON WESTMINSTER CATHEDRAL.

A MEETING of the Royal Institute of British Architects was held at 9, Conduit Street, W., on Monday evening last, the chair being occupied by the president, Mr. Aston Webb, A.R.A. The secretary read a letter from Sir Dighton Probyn intimating the King's approval of Mr. McKim as the recipient of the Royal Gold Medal. The president next referred with deep regret to the death of Prof. T. Roger Smith, and a letter of condolence with his widow and family was moved to be written.

Mr. Charles Hadfield then read his paper on Westminster Cathedral.

In some preliminary remarks Mr. Hadfield stated that the idea of erecting a cathedral for the Roman see of Westminster originated with Cardinal Wiseman a few months before his death in February, 1865. The project was taken earnestly in hand by his successor, Cardinal Manning, and in 1884 the present cathedral site, consisting of about four acres, upon a portion of which had previously stood the Tothill Fields Prison, was acquired for a sum of £55,000. Cardinal Manning died in January, 1892, leaving the task of raising the edifice to his successor, Cardinal Vaughan.

The idea of erecting a great Basilican church, an attempt to reproduce old St. Peter's, was abandoned as impracticable; and with it the competitive system of getting a design. In July, 1894, Mr. J. F. Bentley, who had expressly declined to take part in any competition for the building, was asked to undertake the designing of the cathedral, and consented. Prior to beginning the work he spent some time in Rome, and visited St. Mark's, Venice, and the group of churches on the Adriatic coast which had been influenced by the Sta. Sophia tradition. He admitted that the buildings at Ravenna first enabled him to decide on the forms and treatment of what had been in his mind. On returning to London in March, 1895, he rapidly prepared the plan, with an internal area of some 54,848 sq. ft., of a great Byzantine cathedral which, with the general lines of the design, had been long maturing in his mind. Later a model was prepared, one forty-eighth the actual size, executed in Kauri pine. The foundation-stone—a block of Cornish granite 5ft. by 3ft. and 2ft. 8in. thick—was laid on June 29th, 1895. The Byzantine, instead of the Gothic style, had been decided on after much deliberation. The question of cost weighed heavily against a Gothic design. With modern appliances a Byzantine cathedral of brick would be erected within three or four years with the means at command, leaving the marble and mosaic decorations to be added as time went on and the necessary funds were available. Bentley himself fully concurred in the decision. "I am not attempting a new style," he said, "that is impossible; but intend, as far as I am able, to develop the first phase of Christian architecture." His plan of the cathedral, Bentley explained, was not that of the Eastern church of the Justinian period, but an example of what might have been unfolded had not the decadence of the Roman Empire terminated the growth of congregational requirements in the East. The plans of St. Sergius and St. Bacchus, Constantinople, or of St. Vitale at Ravenna, both of about the same age, it was evident were arranged from a liturgical rather than a congregational standard, while the church of St. Mark, Venice, erected nearly four centuries later, indicates a marked advance in the latter direction, showing clearly the course the development was taking.

The church is not orientated, the axis of the choir being turned to the south-south east. This was demanded by the exigencies of site and surroundings, and by considerations of cost, lighting, &c. It was, moreover, in accordance with Roman precedent, where churches had to follow the lines of existing streets and ways. An important factor in deciding the levels and lie of the foundations, crypt, &c., was the existence of a platform of concrete 9ft. thick, the foundations of the old prison, which underlies a portion of the site in a diagonal line drawn from the north jamb of the great entrance portal to the south pier of the sanctuary arch.

Externally the cathedral has an extreme length of 360ft. and a width of 156ft., the height of the nave being 117ft.; height of the façade (not including the turrets), 99ft.; height of the campanile, 284ft. Internally the dimensions are:—From the main entrance to the sanctuary, 232ft.; depth of the sanctuary, 65ft.; and of the raised choir beyond, 45ft., making a total internal length of 342ft.; width of nave, 60ft.; width across the nave and aisles, 98ft.; and across the nave, aisles, and side chapels, 148ft.; height of the main arches of the nave, 90ft.; and to the crown of the dome, 112ft.

The architect's leading constructive idea has resulted in a great building of brickwork, set in cement-mortar, covered by homogeneous concrete domes, vaults, and flats, &c., without recourse to the use of steel or ironwork, and with a sparing use of oak timber in the roofs of the apsidal choir and the transepts, and of teak in the upper stage of the campanile, with a provision for the gradual completion of the interior by lining it with marble up to a height of 40ft., and above that with decoration of mosaic work.

Mr. Hadfield gave details of the materials used, and particulars of the exhaustive series of tests to which samples of bricks and concrete were subjected by the architect prior to their selection in bulk for the work. The cement selected was "the best Goliath brand," and ground so fine that the residue on a sieve of 5,800 meshes to the sq. in. would not exceed 10 per cent. The brickwork of the footings was double the width of the walls above, the concrete below extending from 1ft. to 2ft. outside. Faversham stocks were used for the lining of the interior behind the future marble and mosaic work; thin Bracknell red-facings (under 2in. thick) for the exterior, Fletton wire-cut bricks for the large piers and the walls, Poole wire-cut bricks for the smaller piers, and hard vitrified blue Staffordshire bricks for the outside facing of the underground vaults and sacristy, and for the damp-courses, set in nearly neat cement. No machine bricks have been used. English bond was adopted generally, the outer facing excepted. For internal facing, stock bricks were used, being best adapted for adherence when coated with the bedding for decorative work. Portland stone from the Brown bed was selected for the external dressings; and a high plinth of fine-axed Penrhyn granite, in courses, set with a bold open joint, was placed at the ground level to resist the injury from traffic. Granite has been used for doorways and elsewhere with the same intent.

As regards the domical construction, the architect's idea had been at first to save much centering by using cast segments of a sphere and building them up into domes; but he afterwards abandoned this method for that of a homogeneous mass of concrete thrown on to a centering. The sanctuary dome alone is pierced, and there are twelve windows encircling it, with an ingenious system of counterforts flanking each opening.

The marble monolithic columns are an important portion of the general scheme of colour-decoration in the cathedral. Great care, skilful research, and a large outlay have been incurred in procuring them. They have been presented by many benefactors. In St. Peter's crypt round the apex below the retro-choir they are of red Norwegian granite, with varied capitals of Hopton Wood marble and Derbyshire marble bases.

The columns on either hand of the nave, twenty-nine in number, are of *verde antico* from the classical quarries lately reopened at Larissa in Thessaly; Greek cippolino from the island of Eubœa; Swiss cippolino from Saillon in the Rhône valley, Languedoc; Italian breccia from Seravazza; grey granite from Norway; and the red granite which is not unlike ancient porphyry. These shafts, 13ft. long, each stand on a moulded base of Norwegian granite. The columns dividing the aisles of the Blessed Sacrament and Lady-Chapels from the sanctuary are of jasper and red Norwegian marble of lovely colour and figure. There are fourteen columns of pavonazzo in the sanctuary galleries.

The columns have delicately sculptured statuary capitals of Carrara marble, each varying in design, and were fixed in position after the main arches carrying the domes were completed and the superincumbent weight had taken its proper bearings. The baldachino above the High Altar, on the design of which Bentley bestowed much care, will be constructed of statuary inlaid with mosaic; and it will be supported by eight superb monoliths of onyx, 15ft. in length, procured from Africa after long search and enquiry.

Cast lead is used throughout, and the roofing and ridges are wrought with welted rolls, while the finials have the individuality inseparable from Bentley's work. The windows are glazed with roundels and white translucent glass, with strong pattern leading. The steps of the circular newel staircases which give access to the crypt, galleries, and roofs are made of hard artificial stone composed of Portland cement and crushed granite. The outer covering slabs of the domes are of the same material. The flats and gutters about the domes and roofs are laid with asphalt. In the large windows Doulton terra-cotta tracery, or lattices, of a varied and piquant design have been made use of.

The heating is by hot air on Haden's system, to be supplemented by low-pressure steam-pipes in the galleries. Two spacious heating chambers are provided in the basements of the Blessed Sacrament Chapel and of the baptistery.

In treating of the design of the interior and exterior the author called special attention to the arrangement of the nave arcading—a favourite feature with Bentley, consisting of the continuous treatment of the arcading along the full length of the nave to the sanctuary arch, without ignoring the crux arrangement of the transepts, which are thereby invested with increase of interest and mystery. This contributes to the perspective and proportion of the interior in a marked degree. The architect has also scored a success in the lighting. The tympanum of each of the main arches is pierced by a semicircular lunette of 25ft. diameter, filled with delicate tracery, and below, between well-defined pilasters, a pair of windows is devised. The lighting is further happily emphasized by the twelve windows round the sanctuary dome. The perspective of the interior has obviously been focussed on the High Altar and its covering, the baldachino, the supreme spot of sacrificial interest. Each bay of the nave holds in its lateral face the mystical number of seven arches, four on the ground level carrying the galleries, each 12ft. span, two secondary arches of 25ft. span, and the great archivolt "embracing and unifying the whole system."

The principal or western entrance from the exterior flanked by the campanile, a composition extending 65ft. and embracing in

Law Cases.

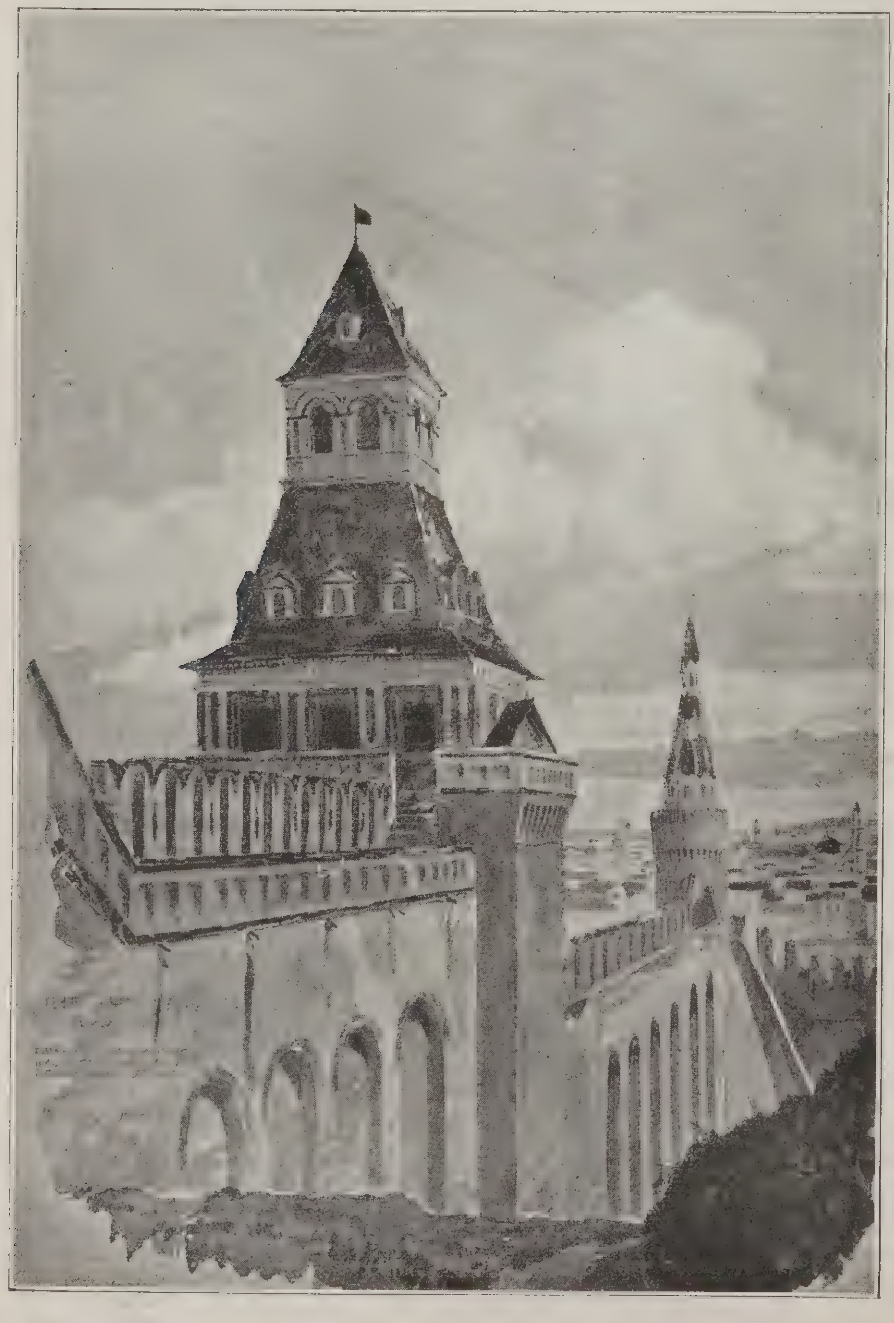
New Districts and Intercepting Sewers: Important Appeal Case.—The case of *The Corporation of Hove* v. *The Brighton Intercepting and Outfall Sewers Board* came before the Court of Appeal on March 9th. The Master of the Rolls said the question raised was whether the District of Hove was entitled to pass its sewage into the intercepting sewers which had been carried along the sea-front of Brighton and the adjacent districts. That right was contested by the Brighton Intercepting Sewers Board, which said that the intercepting sewers were intended for certain wholly different districts. His Lordship thought there was no difficulty in coming to the conclusion that the Sewers Act of 1870 contemplated that which had in fact been done—that is, the formation of an enlarged district. In his opinion the case came exactly within section 91 of the Act, and the plaintiffs were the proper parties to put in motion the machinery of that Act. The judgment of Mr. Justice Kekewich therefore could not be supported, and the appeal must be allowed.—Lord Justice Romer was of the same opinion. Having regard to the Act of 1870, it was clear that any local authority within the definition of that Act had full power to drain all the sewage in its district into the intercepting sewers. In section 91 it was clearly provided that, with regard to what he might call the new drainage authorities coming into existence after the passing of the Act with new districts of their own, if any part of the intercepting sewers was found in a new district then the new drainage authority became the local authority within the meaning of the Act, and when section 91 was looked at there was no limitation put upon the new drainage authority as to any particular parish or parishes. Certainly, the local authority in question must be in the neighbourhood, but otherwise there was no limitation put in that section upon the new drainage authority. A new drainage authority of Hove was created, and a new district of Hove, by an Act of 1873. So that, under that Act, Hove was to be regarded as a local authority within the Act of 1870, and thus entitled to turn the whole of the sewage in its area into the intercepting sewers. The plaintiffs were therefore entitled, in his Lordship's opinion, to a declaration of their right, and also to apply for an injunction, though, if necessary, time would be given to the defendants to carry out such works as might be required to give effect to the plaintiffs' right.—Their Lordships accordingly allowed the appeal.

West Ham Sewage: Huge Claim by the L.C.C.—An arbitration enquiry was opened last week at the Surveyors' Institution, Westminster, before Sir Hugh Owen, sole arbitrator, between the London County Council and the Corporation of West Ham to determine what sum should be paid by the latter for the admission of the whole of their sewage into the sewers of the northern portion of the main outfall sewers belonging to the County Council, which sewers run on a high embankment through West Ham. The County Council claim the sum of £112,700 as a contribution towards the amount of the loans paid off up to the present date of moneys borrowed for the construction of the main system of sewerage. In addition, the County Council claim about £10,000 for interest, sinking fund, maintenance, management and working during the transitory period, and, finally, they claim an annual contribution from West Ham for principal and interest and sinking fund, and for the cost of management, maintenance and working, putting West Ham upon the footing of being part of the Metropolis. The enquiry was adjourned.

Builders' Scaffolding.—The case of *Davidson* v. *Hooydonk & Co., Ltd.*, recently came before the Court of Appeal. It was an appeal of the plaintiff from a judgment of Mr. Justice Wright in the King's Bench Division giving judgment for the defendants. It appeared that in December, 1898, the plaintiff, a builder at Newcastle, entered into a contract with the London and Lancashire, Ltd., of Bradford, to build a theatre at Blackburn for £20,000, and amongst other things the plaintiff had to put up a special scaffolding, and after he had finished using it to leave it for the use of all the trades, and the decorators. The London and Lancashire Co. entered into a contract with the defendants, decorators of London, to do the decorating work at the theatre. By this contract the defendants had to provide £200 to be paid plaintiff for the scaffolding, which was to become the property of the decorating contractors, and to be removed by them on the completion of the work. After defendants had finished their work they took down the scaffolding and sold it for the break-up price of £43. Plaintiff said he was entitled to £200. It actually cost £209 8s. 9d. to put up. Defendants said plaintiff was entitled to the £43, and brought that sum into court. They also contended that their contract was with the company, and that there was no privity of contract between plaintiff and themselves. Plaintiff's case was that he was entitled to have from defendants £200, the value of the scaffolding, as the price of goods sold and delivered.—The Court affirmed the decision of Mr. Justice Wright, and dismissed the appeal with costs.

St. Andrews Street Baptist Church, Cambridge, is to be entirely rebuilt, partly on the foundations of the old building. The tender of Messrs Kerridge & Shaw, of Sturton Street, Cambridge, has been accepted by the committee at £7,458, and the work has just been commenced. The architects are Messrs. George Baines, F.R.I.B.A., & R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

The Portion of the Kremlin Wall at Moscow, which is shown on this page, is attributed to the time of Ivan the Terrible (contemporary with Elizabeth). The roof is of copper, but formed with tiles instead of sheets, the tiles being stamped like inverted Moresque battlements. The mass of the masonry is in yellowish brick with dressings, copes and mouldings in red brick.



THE KREMLIN WALL, MOSCOW. DRAWN BY PERCY E. NOBBS, M.A., A.R.I.B.A.

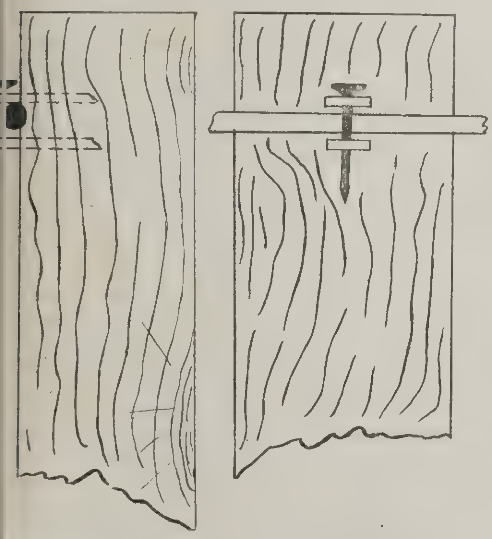
BARBED WIRE.

A New Method of Fixing it.

IT is hopeless to dream of barbed wire being used less frequently than at present: it is too useful to the farmer in the evil days which have fallen upon him, but during the winter months—say from November 1st to May 1st, when almost all the horned stock upon the farm are housed in buildings or in the yards—there is no agricultural reason whatever for the maintenance of barbed wire in position.

A farmer's objection to taking it down during the winter is the trouble and cost of the labour incurred, and especially is this the case with some cow-keepers, whose little holdings are often fearfully and wonderfully entangled with barbed wire.

The ordinary method of erecting such a fence is to drive in stumps so that they stand from 3ft. to 3ft. 6in. out of the ground and then to strain the wire on the posts at the extremities, securing it by staples at every stump. Of course when taking it down again each of these staples has to be drawn or cut.



It has occurred to the writer that a very simple plan, which he has adopted for some years, is not so well known as its excellence deserves, and possibly it may prove of some use in minimising the difficulty which seems yearly growing in all hunting districts. The plan is to strain the wire on posts at the ends in the usual way, but, instead of stapling it upon the intermediate stumps, to drive into each stump two staples (1½in. staples are long enough), the one about half-an-inch above the other, as shown by the above sketch, and at the correct height to receive the wire. They should project about ⅝in. from the stumps and slightly more than this if the stumps be rough. The wire is then placed between the staples and kept in position by means of a fairly large-headed nail passed point downwards through both staples. Rose-headed or wire-nails are the best for the purpose, and need not be longer than about 2in.

To take down the wire, it is only necessary to cut the staples by which it it kept strained at one end of the line, and two men can then roll the wire upon a reel almost as fast as another can remove the nails by means of a hammer or knife-blade, according to the kind of nail employed.

The reel need not be elaborate, but may be the simple one upon which the wire is wound when first purchased, and it may be carried on a stout stick, or by a very little ngenuity it may be mounted upon a wheelbarrow and so wheeled along the line of ence. The stumps of course may remain tanding, and the re-erection of the wire the next summer then becomes almost as simple proceeding as its removal. G. S. M.

Views and Reviews.

The Progress of Egyptology.

This archæological report comprises the work of the Egypt Exploration Fund and the progress of Egyptology under various investigators during 1901–1902. The former has already been dealt with in these columns, and as regards the latter we may say that it is a concise account of what the German, French and other archæologists are doing on Egyptian sites. The editor, Mr. Griffith, deals with archæology, hieroglyphic studies, &c., in general; Mr. Kenyon with Græco-Roman Egypt; Mr Crum with Christian Egypt; and Mr. Salmon on the "Progrès des Etudes Arabes." Several maps of Egypt are given at the back of the report.

"Egypt Exploration Fund: Archæological Report 1901-1902." London: Offices of the Fund, 37, Great Russell Street, W.C.

The Cathedral of Paris.

Students will find this an admirable handbook to Notre Dame de Paris. Like others of the same series, it deals first with the general history of the building and then describes each part in detail. The author devotes a brief chapter to the place of the cathedral in the evolution of French Gothic architecture, making considerable use of that indefatigable investigator, Viollet-le-Duc. It is remarked that Notre Dame was the first of the greater French cathedrals in which Gothic principles of construction were logically carried out—it is older than Amiens. The nave, with the exception of the extreme west end, was completed about 1195 and the west facade built in the early part of the thirteenth century. The two great towers were naturally intended to carry spires. Looking at the plan, it is at once seen to differ very materially from those of our own cathedrals; more especially in the transepts, which are very short, and the double aisles at each side of the nave—features quite French. It is noticeable, too, that there are no monuments choking the arcades, as at Westminster, and no screen between the nave and the choir; so that the whole length of the cathedral is uninterrupted. One need hardly say that Notre Dame has been through the hands of restorers, but the author, though opposed to restoration on principle, cannot help feeling that the work executed by M. Viollet-le-Duc and M. Lassus is far less objectionable than it might have been. Speaking of the west front, he says: "The sculptured decoration of the three great portals exceeds, if not in actual ornateness, at all events in real beauty, that of any cathedral in the west of Europe. Much of it has suffered at the hands of the iconoclast, but, looking to the vicissitudes through which Notre Dame has passed, it is wonderful that so much of the original sculpture has been preserved. The recent restoration has been carried out with a skill which is simply marvellous, and the uninformed observer may easily be betrayed into the belief that he is looking at an unaltered ancient work. Whether this is a gain or a loss each of us must decide for himself." The author describes in detail all the parts of the cathedral, and explains how they have been altered—especially the nave pillars, which were obviously first intended for quadripartite vaulting and consequently look awkward with the sexpartite system. Then of course the beautiful window glass is considered, and also Viollet-le-Duc's polychromatic decoration, which, in spite of all the elaborate precautions, the patience and the learning given to it, the author does not appreciate. "One wearies of the ingenious geometrical curves, the crosses, the squares, the lozenges, the coloured stars, the excessively and laboriously conventionalized foliage, and the rest. The whole strikes one as dead and mechanical, as mere covering of stone for the sake of doing so." The book is well illustrated from photographs and drawings.

"Notre Dame de Paris," by Charles Hiatt. Continental Churches Handbooks. London: G. Bell & Sons, Covent Garden, price 2s. 6d. nett.

Fletcher on Quantities.

Those who remember the earlier editions of this work will thoroughly appreciate the increase in size and the great improvement in quality of this last edition, which certainly make it one of the most complete works upon the subject. There seems to be no limit to the examples or detailed instructions that might be given without exhausting all that might be said about this important department of the work associated with building—sufficiently important, we maintain, in spite of Mr. Fletcher's assertion to the contrary, to make it necessary to treat the practice of it as a separate profession. Mr. Fletcher anticipates objection to his father's opinion that it can form a portion of an architect's practice by saying that he is aware that surveyors who do nothing but "quantity work" will join issue with this view. We would, however remind Mr. Fletcher that it is not only "surveyors who do nothing but 'quantity work'" who will object. Chief amongst these objectors will be those to whom the quantities are all-important, viz., the contractors. However, this is not the occasion to enlarge upon the matter.

The author has given a very complete set of examples of taking off, by taking a complete building—small, it is true—but one comprising a large variety of items. There are also good examples of individual items with detailed drawings, such as it is not often the good fortune of surveyors to have to work from. There will of necessity be some divergence of opinion as to the methods adopted, as even in such a prosaic business as the one this work deals with, there is room for individuality. A small thing—but one likely to lead to confusion—is open to objection. On pp. 271 and 277 dimensions of semicircles written in precisely the same way in the first instance are intended to indicate the area and in the latter the girth. The latter should be ascertained by the "taker-off," or some note added making the intention clear. The circular portions of stone coping on p. 295 should, we think, be taken as "extra *stone* and labour." These are questions of fact and not of opinion.

The chapter on legal decisions is interesting but, through no fault of the author, not so useful as it ought to be, as the legal opinions with regard to surveyors' work seem to show an alarming amount of judicial ignorance, *e.g.*, the well-known marvellous decision of Mr. Justice Quain (p. 245). However, some of the cases cited will be of use in relieving the surveyor's mind on the legal difficulties of his position. One would have thought that by this time his position as to appointment, liabilities, &c., would have been definitely settled.

The schedule of rate of wages will be found most useful, and altogether the work can be considered one of the most complete, and, used with discretion—as all text-books must be—of great assistance to the student of this important profession.

"Quantities for the use of Architects, Surveyors and Builders," by the late Prof. Banister Fletcher, J.P., F.R.I.B.A. Seventh edition, revised and enlarged by H. Phillips Fletcher, F.R.I.B.A., F.S.I., &c. London: B. T. Batsford, 94, High Holborn, price 7s. 6d.

Royal Academy Exhibition.

The receiving day for architectural works at this year's Royal Academy Exhibition is Friday, March 27th. We shall be pleased, as in previous years, to receive drawings from intending exhibitors, and undertake to deliver them at Burlington House free of charge; but they must reach us at latest by noon on the day mentioned. The earlier they are sent the better.

(*Continued from* p. 71.)

the great arch three doorways—the outer for the laity, and the middle for the cardinal, archbishop and clergy—leads into porches attached to a spacious narthex the entire width of the church, terminating at one end with an entrance from the side street, and with the baptistery at the other.

The narthex gives access to the nave, 60ft. wide, divided into three bays of 67ft. each, covered with domes rising out of pendentives. The aisles, 15ft. wide, are separated from the nave by marble columns supporting a continuous groined arcade. From the easternmost bays of the nave transepts of unique and interesting design project with additional entrances. Two larger chapels open right and left out of the transepts, with side aisles giving access to the sanctuary and to the sacristies.

Over the sanctuary will be suspended a gilded and decorated wooden crucifix, 30ft. high, with paintings of Christ, the four Evangelists, and the "Mater Dolorosa"—this will be the dominant note of the whole interior. The baldachino, flanked by eight monolithic columns resting on pedestals taking a semicircular form, bears a marble canopy. The High Altar is a solid block of Cornish granite, fine-axed over, 12ft. by 4ft. On the left side is the marble archiepiscopal throne on its own daïs, modelled after the ancient one in the Lateran basilica. The pulpit has been executed in Rome, and is of marble decorated with mosaics.

As regards decoration, two only of the side chapels are in a forward state of progress. In the Chapel of SS. Gregory and Augustine the altar and marble work are completed and the mosaic work is proceeding, while in the opposite chapel, that of All Souls, on the north side of the nave, the altar, with its reredos and pictures in *opus sectile*, is completed, and the finishing touches are being put to the mosaics of the vault and arches, which are from the cartoons of Mr. W. C. Symons.

Having described various works in hand or contemplated, the author drew attention to the working part of the cathedral—the sacristies, strong-room, stores, registry, &c. Working drawings of a marble flooring of great beauty and originality had been completed by the architect, a portion of which only is to be carried out.

The most striking feature of the building is the west front, with its deeply-recessed entrance arch of 40ft. span enclosing the tympanum, which is to be filled with a mosaic picture. The entrance arch is 4ft. wider in its span than that of St. Mark's at Venice, and is planned in receding orders, supported on columns whose entablature is carried across the entrance and beneath the three doorways, the doors for which are executed in teak, to be covered eventually with bronze plates. The upper portions of the front terminate again with domed turrets and are flanked to the north by the campanile set back from the upper portion of the front. The latter has a delicate entasis. The upper portion is gathered from the square to an octagon crowned by a teak-framed cupola covered with lead, and terminates in the bronze archiepiscopal cross, some 10ft. in height.

Mr. Hadfield concluded with a reference to Bentley's death. He had seen him the previous day at his office in the Adelphi and was then shown drawings of the great crucifix and marble pavements. They were to spend the next day together at his home at Clapham Common; but in the evening Bentley had a paralytic seizure, and passed away in the early hours of the following morning.

A discussion followed in which Prof. Beresford Pite, Mr. Alfred East, A.R.A., and Mr. Walter Millard took part. For want of space we are obliged to hold over our report of it till next week.

Keystones.

A Board School at Edinburgh is to be erected from designs by Mr. J. A. Carfrae, of 3, Queen Street, Edinburgh.

A new Asylum on the Horton Estate, London, is proposed to be erected at a cost of £569,500.

The Windows in St. Saviour's Collegiate Church, Southwark, in the north transept, are to be filled in with stained glass.

The Maternity Hospital, Govan, Glasgow, in Langlands Road, has been erected from designs by Mr. James Burnett.

A new Church of St. James, Walthamstow, is being erected at a cost of about £10,000. It will seat nearly 1,000 persons. The architects are Messrs. J. E. K. & J. P. Cutts.

"One and All Gardening" for 1903 has just been issued (92, Long Acre, W.C.). It is an astonishing twopennyworth, so that one is not surprised to learn the first issue will be of 80,000 copies.

The Annual Dinner of the Sanitary Institute, to be held on Friday, May 15th, at the Hotel Cecil, will be presided over by His Royal Highness The Duke of Cambridge, K.G., the President of the Institute.

Islington Church.—The demolition of the parish church of St. Mary in Upper Street, Islington, has been commenced. The church was only built about 100 years ago, but was recently condemned as structurally unsafe.

Sir Charles Wyndham's new Theatre in St. Martin's Lane is only separated at the rear from Wyndham's Theatre in Charing Cross Road by a small court. The architect was Mr. W. G. R. Sprague. The whole of the building has been decorated in the Louis XVI. style by Messrs. Waring & Co. The stage is 35ft. deep and 60ft. wide.

A new Bank at Aberdeen is being erected at the corner of Marischal Street and Regent Quay from designs by Mr. R. G. Wilson, of Aberdeen. The contractors are:—Mason, Mr. J. Morgan; carpenter, Mr. J. Henderson; slater, Mr. George Farquhar; plumbers, Messrs. Thom and Strachan; plaster, Messrs. James Bannochie and Sons; and painters, Messrs. Gordon & Watt.

British Standard Sections.—Referring to the note on p. 49 of our last issue, Mr. Leslie S. Robertson, M.I.C.E., the secretary of the Engineering Standards Committee, states that the Committee is really only commencing a large portion of its work, and the publications just issued, important as they are to the steel trade, only cover a very small portion of the total work in hand.

Value of Land in the City.—The building site at the corner of Cheapside and Paternoster Row, occupying a ground area of 945 ft. sup., and with a frontage of 71ft., was last week let by auction, on an 80 years' building lease, at £1,150 per annum, being at the rate of £1 4s. 4d. per ft. rental, which, capitalised at thirty years' purchase, would give a freehold value of £36 10s. per ft. Mr. Delissa Joseph, F.R.I.B.A., is designing the new buildings which are to occupy the site.

Motherwell Poorhouse Competition.—The Dalziel Parish Council have selected plans for a new poorhouse, which is to cost £12,000. Fourteen sets of competitive plans had been submitted to Mr. Bryden, architect, Glasgow, as assessor, and on his recommendation the awards were made as follows:—(1) Mr. Alexander Cullen, Motherwell; (2) Messrs. Ninian M'Whannell and John Rogerson, West Regent Street, Glasgow; (3) Mr. Frank Southorn, St. Vincent Street, Glasgow. A committee was appointed to confer with Mr. Cullen to have the plans approved by the Local Government Board.

The Income Tax Recovery Agency has been established at 3, Copthall Buildings, London, E.C., to give advice free of charge on receipt of a stamped addressed envelope.

Dover Breakwater.—The first block was laid last week in connection with the great breakwater across Dover Bay. The breakwater will be 4,300ft. long.

A new Electric Light.—The Library of the Royal Institution will be illuminated by about 40ft. of "Linolite" on the occasion of next Friday's evening lecture.

The Val de Travers Asphalte Paving Co., Ltd., have declared a dividend of 10 per cent. for the year 1902, together with a bonus of 20s. per share, free of income-tax, carrying forward £13,046 to next account.

The Edinburgh Master-Builders' Association has elected Mr. Neil M'Leod president, Mr. James Cameron secretary and treasurer, and Messrs. James Forrest, Thomas Hume, and David Wilson, vice-chairmen.

Edinburgh Architectural Association.—No. 3, Vol. 3, of the "Transactions" has just been issued. It consists of the following papers: "Restoration of the Mausoleum at Halicarnassus," by Thomas Arnold, A.R.I.B.A; "Inverkeithing," "Rosyth Castle" and "Elgin Cathedral," by Henry F. Kerr, A.R.I.B.A.; somes notes on Bavelaw Castle; and a paper on "The Architectural Antiquities of Leith," by James Campbell Irons, S.S.C.

The Wellington Memorial.—In our last issue we published a photograph of Alfred Stevens's full-size model of the equestrian statue of the Duke as it stood in the vaults of St. Paul's Cathedral. The accompanying paragraph stated that this actual model was in Mr. Tweed's studio at Chelsea: but this is not so. It is a plaster cast taken from Stevens's model that Mr. Tweed is working upon, it being the intention to preserve the original model in a museum.

New Reference Library and Art Gallery for Manchester.—On Friday last the Manchester Corporation Infirmary Committee decided to offer £400,000 for the present site of the Manchester Royal Infirmary in Piccadilly, the Board of Management of that Institution having resolved to build new headquarters away from the centre of the city. The land so acquired will be utilised for the erection of a new reference library, the top floors of which will be so arranged as to be suitable for art gallery purposes, subject to the approval of the Art Gallery Committee.

Pontypridd Public Offices Competition.—Out of the fifty-five designs received by the Pontypridd District Council for new offices, for which three prizes were offered, the assessor has pronounced the following to be the best:—1st, Those submitted by Mr. Henry T. Hare, 13, Hart Street, Bloomsbury, London; 2nd, Mr. Hanley D. Adshead, 46, Great Russell Street, London; 3rd, Mr. A. Colbourne Little, 9, Gray's Inn Square, London. Mr. Hare will superintend the work of erection, and the authors of the other designs will receive premiums of £60 and £40 respectively.

Competition Reform Society.—The committee disapproves of the existing conditions of the two competitions respectively for a town hall, &c., at Yeovil and a new boys' school at Bolton-upon-Dearne, but is endeavouring to get them revised. In the opinion of the committee the conditions of both are "entirely unsatisfactory." They therefore request their members to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised. The Committee notes that the conditions of the competition for a proposed town hall at Chepping Wycombe have been revised, and now recommends the same as satisfactory.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Qualification of Building Surveyor.

LONDON, N.W.—G. T. M. writes: "What are the qualifications for a building and sanitary inspector?"

See reply to an enquiry upon this subject on p. 335 of our issue for July 9th, 1902.

Age Limits for R.I.B.A. Examinations.

SUSSEX.—ENQUIRER writes: "What are the age limits for the R.I.B.A. examinations—is eighteen too old to start?"

There is no limit in the ordinary examinations. In the Special the applicant must not be less than twenty-five years of age. Eighteen years is none too young to take the Preliminary.

Masons' Marks.

WHITBY.—CAEDMON writes; "In what number of THE ARCHITECTURAL REVIEW did an illustrated article on masons' marks appear? Is there a cheap book dealing with this subject?"

THE ARCHITECTURAL REVIEW for October, 1900. We do not know of any other publication on the subject.

Fees for Plans, Tracings, &c.

TIPTON.—QUERIST writes: "What would be a reasonable fee for the following?:—(1) Preparation of a full set of plans and sections for a house costing £200; (2) coloured cloth tracing from same for district surveyor; (3) personal superintendence during course of erection. My client did not give the work to a contractor, but bought all materials and let the various trades."

(1) £10; (2) £1; (3) £9, making £20 in all.

Country Church to Measure within Fifteen Miles of Westminster.

LONDON, S.E.—ARCHITECTURAL CYCLIST writes: "Kindly name some country churches worth measuring within ten or fifteen miles' radius of Westminster (south preferred)."

There is no complete country church worth measuring within the radius named, though there are some good fragments at Merton, including a simple but beautiful Decorated window at the east end of the north aisle; a Norman doorway on the north side apparently of two dates, or else made up of two fragments which do not agree; a door to this doorway with extremely old, probably thirteenth-century, strap ironwork on it; a rich timber porch, date about 1400, which has been cased in modern times, grained and varnished, but is still worth measuring; and a Perpendicular chancel roof. G. A. T. M.

Architectural History.

SHEERNESS.—A. M. S. writes: "I should be glad to have some information about books to purchase for the Society of Architects' examination. I wish to keep the expense down as much as possible."

Banister Fletcher's "History of Architecture" (B. T. Batsford, 21s.) should give all the information you require.

Jacks.

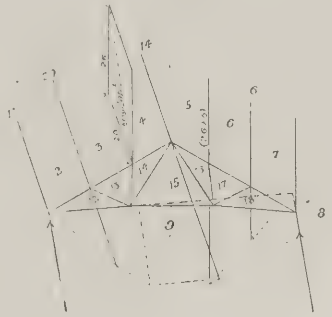
WALLSEND-ON-TYNE.—BEDE writes: "What is the name of the appliance shown by the accompanying drawing (not reproduced)?"

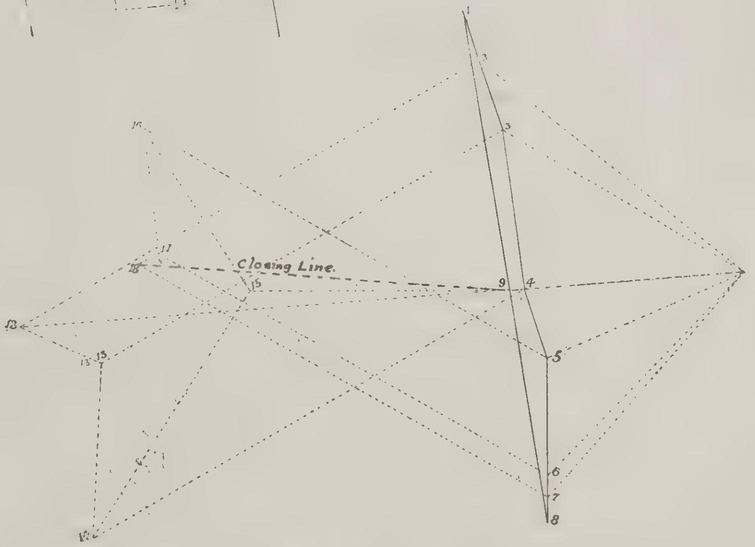
The appliance is a coach-jack and is used for raising wheels of carriages just off the ground so that they can be turned round for cleaning, painting or repair. The short arm is placed just under the axle next to the hub and requires no greater projection.

Stresses in Roof Truss.

HALIFAX.—G. H. B. writes: "At last year's Building Construction Examination, Honours, Part I., I gave to question 44, on the iron roof truss, the solution shown by the accompanying diagrams. As it does not correspond with your answered questions, I should like to know if I should get the marks for it."

Your solution is seriously wrong. (*a*) It is quite allowable to place the ceiling loads on the top of the truss for the purpose of finding the reactions on the supports of the truss, but they must be attached to their proper joints when the stresses in the members are being found; this has not been done. (*b*) In replacing the truss, considered as a rigid body, by the rope or string as drawn, the forces 4, 5, and 5, 6, cross one another before reaching the string. In such a case 5, 6, should come on the diagram of stresses *before* 4, 5, and is not so drawn. There are other minor defects. As to whether marks should be given for such an answer, very much depends upon the standard set up by the examiner. The answer shows some knowledge of the routine of drawing stress diagrams, but not sufficient grasp of the principles on which the work depends. The reports of the examiners are published; it appears that the general quality of the answering was such that a *low standard* had to be applied in judging, and it is quite possible that some marks were given for this answer.





STRESSES IN ROOF TRUSS.

Stability of Roof.

PORTSMOUTH.—QUERIST writes: "With a corrugated iron roof, 100ft. by 30ft., supported on 13ft. columns, with entirely open sides, what precaution should be taken to prevent the building blowing over?"

Assuming a curved roof of ordinary rise, the total pressure tending to overturn it might amount to about 5 tons, and if all the columns are well bolted down to concrete blocks, containing not less than 4 cub. ft. each, there would be little danger of overturning. There is, however, a possibility of the roof being lifted unless well fastened to trusses, and trusses bolted to heads of columns. HENRY ADAMS.

Circular Concrete Reservoir.

FILEY.—R. W. S. writes: "Does the accompanying sketch (not reproduced) show a practicable and economical method of constructing a reservoir to hold about 8,000 gals.?"

The sketch shows a monolithic structure of 5 to 1 concrete, 15ft. diameter and 8ft. deep, upon a cylindrical base 18ft. high, and strengthened by three $2\frac{1}{2}$ by $\frac{5}{8}$ iron rings embedded in the walls. The tension to be resisted will be $\frac{15 \times 8 \times 62{\cdot}5}{2} = 3{,}750$lbs. on each side at the bottom of reservoir, reducing to nothing at the top. The centre of pressure from the water is at two-thirds of the depth, and if the walls were free to move outwards the whole tank could be tied in by an iron hoop at this level, but the connection with the bottom alters the conditions, and the knowledge of the centre of pressure has in this case no practical value. Owing, however, to the greater pressure towards the bottom the strengthening should be somewhat in accordance therewith. With three rings in a depth of 8ft. the distances should be about 1ft. from bottom to centre of first, 1ft. 6in. centre to centre between first and second, and 2ft. 6in. between second and third. The cornice may then have a light ring, say $\frac{3}{4}$in. sq., embedded in it. They should all be in the centre of the thickness and be welded to complete the circle. The concrete for the reservoir should be strong and impervious, so that 4 to 1 floated with neat cement inside or asphalted would be more desirable than plain 5 to 1. It should also be allowed to set for three months, if possible, before the water is let in, to allow the strength to develop. Spacing the rings as above, the strength of the walls may now be taken as a whole. The total tension to resist on each side will be $\frac{3750 \times 8}{2} =$ 15,000lbs., of which the concrete will take, say, one-third, leaving 10,000lbs. for the iron rings, $\frac{10000}{3} = 3{,}333$lbs. each, which at $2\frac{1}{2}$ by $\frac{5}{8}$ will be less than 1 ton per sq. in. This seems a very large margin of safety to allow, but in view of the want of experience in the mode of construction a high factor of safety is necessary. As regards the support for bottom of reservoir, it is presumed that old rails are intended to be used below the concrete, but no mention is made of the shape, whether flange or double-headed rails, but either would no doubt be sufficient. The 100lbs. per ft. steel girder would also be ample if the ends are supported on a good stone template. The base of wall supporting tank will have a load of about 3 tons per sq. ft. to carry, which is not excessive. The footing, being spread to 2ft. 6in. wide, will cause about $1\frac{1}{2}$ tons pressure on the soil, which is not too great if it is good gravel; but if clay, the footing should be carried down to at least 5ft. below ground level, and spread to 4ft. wide, with batter to meet the walls and, say, three rows of stout hoop-iron embedded in it with the ends hooked over to make a continuous tie. All the ironwork should be protected by some good composition, such as the "carbonising coating" manufactured by the Goheen Manufacturing Co., Canton, Ohio, U.S.A., 1 gal. of which will cover 1,000 sq. ft.

HENRY ADAMS.

Alterations in Contract.—Architect's Power to Order Extras.

PORTSMOUTH.—R. J. J. writes: "(1) In what position does an architect find himself when a contractor refuses to execute additions, deductions or alterations, there being no condition expressly giving the owner or architect power to vary the contract? (2) Would a clause providing for the manner of payment for extras imply the architect's power to order such variations? (3) If the architect has the power to order variations, and did so to such an extent as to very materially reduce the contract, must the contractor submit? It might happen that only the class of work he least wanted would remain to be done. The above refer to simple contracts—no quantities."

(1) The contractor must carry out the alterations, deductions or additions, or you can get someone else to do it and deduct it from the builder's account. (2) Yes. (3) The architect certainly has the power to order any deductions he pleases, and the work executed is to be paid for according to the priced bill of quantities.

Drains to New Houses: Liabilities of Corporation.

TENBY.—SEWER writes: "The owner of land, A, on one side of a public road proposes to build some semi-detached houses fronting the road. There is no sewer actually in the road within 120ft. of the proposed houses; but on the opposite side there are houses on land belonging to the Corporation, which are drained into the main sewer in a street which joins the public road at right angles, near the centre of proposed buildings. (1) A asks the sanitary authority to lay a sewer in the public road to enable him to drain the houses. They demur and propose to extend the sewer in the side street (their own property as a Corporation) up into the public road only, so as to bring the end within 100ft. of most of the houses, and then for A either to construct a sewer himself in the public road, or join each block separately with the end of the sewer. Can they not be compelled to put a sewer in the road, or can they compel A to do it? The natural and proper line of drainage would be down the road. (2) As the houses are semi-detached, each two are shown drained into the road by one line of pipes. An objection is made that this will constitute the joint portion a public sewer repairable by the sanitary authority. Have they any right to veto any such arrangement? I may say they have no right under their by-laws, which are antiquated and not based on the Model By-laws. (3) Can it be right for an owner to be compelled to lay a sewer in a public road when, the day after, the authority may take possession of it as a public sewer and use it for the surface drainage of the road?"

(1) The local authority apparently offer to do all that can be reasonably expected under the circumstances, leaving A to connect his drains with the public sewer in some approved and convenient manner. (2) Yes, the Public Health Act of 1875 states that all drains emptying into a sewer must comply with the *regulations* (not by-laws) of the local authority. (3) Yes, under certain conditions the local authority are quite justified in calling upon an owner to lay such a drain or sewer for the purpose of connecting his property with the public sewer. T. E. C.

Book on Marble.

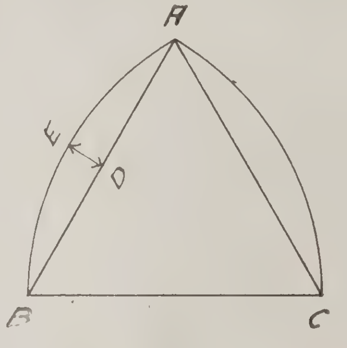
LONDON.—ASSISTANT writes: "Is there a good economical work on marble, with coloured plates?"

"Limestones and Marbles: Their History and Uses," by S. M. Burnham (S. E. Cassino & Co., Boston, U.S.A.).

Quantity Surveying.

PAKEFIELD.—T. M. writes: "(1) Is there a paper devoted to building published in Ireland? (2) Would the London system in quantity surveying be recognized in Ireland? (3) Is there a method of exactly getting the deductions for Gothic openings from springing without dividing them geometrically into sections? I refer to deductions for brickwork."

(1) Yes; the "Irish Builder," published weekly, price 1d., at 11, Lower Sackville Street, Dublin. (2) From enquiry I find that the London system would generally be recognized in Ireland. Irish surveyors generally do not go so much into detail as the London surveyors do, but otherwise follow the same lines. (3) There is a method of getting deductions for Gothic openings, but it is such a lengthy and roundabout one that in practice it is much better to divide into sections, besides being quite as accurate. However, I give Peter Nicholson's method for what it is worth:—(*a*) Take the triangle ABC in the usual way. (*b*) Multiply the length of the chord AB by the height DC, and to two-thirds of the product add the quotient arising from dividing the cube of the height DE by twice the length of the chord AB. The formula would be—



$$\tfrac{2}{3}\,AB \times DE + \frac{DE^3}{2AB}.$$

As there are two of these in a Gothic opening the result must obviously be twiced and added to the area of the triangle.

W. E. D.

"Making-up" a Road.

URBAN writes: "Has an urban authority in 'making-up' a road under the Private Street Works Act, 1892, power to include in the cost of the works, and to charge the frontagers therewith, the amount expended by them in relaying or repairing defective sewers (soil and surface water) in the road? Did not the authority accept the responsibility of these sewers, and did not they become vested in the authority from the date (several years previously) when they permitted them to be connected to the general drainage system of the district? Further, are not these sewers really 'sewers' and not private 'drains,' and as such repairable by the authority?"

If the street is not sewered to the satisfaction of the urban authority, then the Act provides for the local authority apportioning the cost of the necessary works in connection therewith amongst the frontagers. No hard-and-fast rule can be laid down as to what constitutes the legal definition of a drain or sewer, and which is capable of application to every individual case. The exact interpretation depends to a large extent upon the local conditions, and it by no means follows that because a private drain which receives the drainage from more than one house has been connected to the general drainage system of a district that such drain or sewer thereby becomes vested in the local authority for maintenance or repair. Under the Public Health (Amendment) Act of 1890, when two or more houses belonging to different owners are connected to a public sewer by a single private drain, this drain may, under certain circumstances, be considered as a drain and not a sewer. The advice of a local solicitor should be taken upon the point at issue, as he would be able to make himself acquainted with the special circumstances bearing upon it. T. E. C.

Gothic Vaulting.

LANCS writes: "Kindly name a work dealing with the construction—not the design and geometrical setting-out—of Gothic vaults. I want one that shows the centering, &c."

We do not know of any book that will give you the information you require.

Stains for Wood.

CHESTERFIELD.—H. B. writes: "(1) Who are makers of green and blue stains for use on pitch-pine, canary, white wood or oak; also what length of time may they be expected to retain their colours under ordinary circumstances? (2) Would whitewash or colour-wash applied to old weather-beaten brickwork prevent further decay and act as a preventative?"

(1) Fumene Company, 47, Martin Road, Woodside, South Norwood, and Henry C. Stephens, 57 and 59, Aldersgate Street, E.C., are makers of good stains. A green or blue stain should last about fifteen years. (2) Yes.

Terra-Cotta Modelling.

BLANTYRE.—P. G. writes: "Where can I obtain little modelling miniatures in brick-red and buff terra-cotta?"

We do not know exactly what you mean by "modelling miniatures." But you should be able to get what you want from Messrs. Doulton & Co., of South Lambeth, S.W.

Books for R.I.B.A. Intermediate Examination.

HULL.—H. T. F. writes: "What books should I study for the R.I.B.A. intermediate examination in (1) classic ornament; (2) English mouldings and ornament, 1000–1550 A.D.; (3) history of Mediæval and Renaissance architecture in Europe; (4) stresses and strains? Also which two plates in Phenè Spiers's 'Orders' do you recommend to be drawn for testimonies of study?"

(1) R. Phenè Spiers's "Orders." (2) Pugin's "Specimens of Gothic Architecture" and J. K. Colling's "Details." (3) Banister Fletcher's "History of Architecture." (4) Rivington's "Building Construction," Vol. IV. The student must choose the plates of the Orders for himself.

Oak Gate Posts.

BURNHAM.—W. J. P. writes: "I recently supplied and fixed oak gate posts 12ft. high and 9in. square, wrought, moulded, and oiled with boiled linseed. Four or five months afterwards the posts commenced to open, and eventually looked, I must confess, rather bad. The architects then condemned them and ordered me to procure others and fix them. I contended that as the architects allowed me to fix them (the posts were on the job a considerable time before being fixed, and were inspected by the architects) I was not responsible; in addition to which oak always does open. However, I obtained other posts (the very best I could get) and kept them for some months; these also opened, although covered up, and at last the architects decided to allow the posts to remain if I would paint and grain them. Were the architects' demands reasonable?"

It is impossible to prevent oak warping and splitting when exposed outside and difficult enough in dry situations. The architects' demands were therefore unreasonable, and you are entitled to an extra.

Sanitary Institute Examination.

COLNE.—ENQUIRER writes: "Please recommend the most suitable books to obtain for preparing for the Sanitary Institute examination in practical sanitary science, together with price and name of publisher."

Apply to Mr. E. White Wallis, the Secretary of the Sanitary Institute, Parkes Museum, Margaret Street, W.

Working Stress.

LONDON, S.W.—J. S. writes: "I want some steel joists to carry a certain load at a given distance between supports. The manufacturers state that joists of the size and span mentioned will sustain a distributed load of 13 tons with a working stress of 5 tons per sq. in.; but with a working stress of 10 tons per sq. in. they will carry more than double. What is the working stress, and what has it to do with the load to be carried?"

When a beam of any material or shape is supported at the ends and loaded on top it bends. The bending causes compression, or tendency to crush, in the upper portion, and tension, or tendency to tear, in the lower portion. The intensity of this predisposition to compression or tension is called stress. The ultimate stress is the amount per sq. in. at which failure would take place, while working stress is the safe limit which may be adopted in practice. The working stress for wrought-iron with dead loads is 5 tons per sq. in. and for mild steel 7 tons, but in architectural work mild steel is often used at a higher stress and considered safe up to a maximum of 10 tons per sq. in. It depends upon the circumstances of the case whether it should be kept to the lower limit or allowed to reach the higher one. With a moving or vibratory load the working stress must be kept lower, as a suddenly applied load may double the stress. There are other points to consider besides the maximum compressive or tensile stress in a steel joist; for instance, a stress of 10 tons per sq. in. may not be too much for the strength of the joist, but the load that produces it may cause an inconvenient amount of deflection. Also, in short joists the load may not be sufficient to distress the flanges and may yet produce an excessive shearing stress on the web, which may require stiffening over the abutments. HENRY ADAMS.

Measured Drawings of Eton College.

Rev. H. C. WINDLEY (St. Chad's, Bensham, Gateshead-on-Tyne) writes: "Your correspondent will find plans of Eton in the appendix to Willis and Clark's 'Architectural History of the University of Cambridge,' and a few small scale drawings of parts of the buildings in the letterpress of the first volume of that history. Eton is included in this history because it was the sister-foundation of King's College, Cambridge."

The Position of Builders who are Town Councillors.

MACCLESFIELD.—BUILDER writes: "Under the new Education Act what would be the position of builders who are also town councillors as regards doing any work at school buildings the Committee of which receive aid from the Council? This may be a serious matter to some builders who are town councillors."

I can find no case decided on the point you mention under the Education Act. However, outside the special regulations as to contracts which every corporate body is empowered to make, the principle upon which the decisions are made in regard to dealings between parties situated like yourself is that a trustee cannot benefit by his trust. If a builder happens to be a member of a corporate body, with which body as an outsider he contracts, strictly speaking he cannot make any profit by his contract, because as a member of the Council he is, so to speak, a trustee for the ratepayers, out of whose moneys as a builder he is to be paid. As a builder he is entitled to a fair and legitimate profit in his contract; as a trustee he is bound to hand over that profit to the ratepayers or their representative the Town Council on the principle just stated. But in practice the principle is seldom if ever so strictly administered, so long as the contract is *bonâ fide* and reasonable. However, in the special case you mention, as the persons or body in whom the schools are vested only receive a grant "in aid" from the Town Council, it is very improbable that any Court would hold that you stood in such a fiduciary position towards them as to cause the relationship of trustee and *cestui-qui-trust* to arise between the parties. W. JOHNSON-ROBERTS.

Size of Girders and Piers for Travelling Crane.

LONGTON.—STUDENT writes: "The accompanying plan (not reproduced) shows an 8-ton travelling crane on girders. Will the piers be strong enough, and what size girders should be used?"

The only difficulty in this case is that putting the girder near the face of the piers brings an excessive stress upon the face-work, so that it would be an advantage to face the piers with blue bricks or other hard bricks set in cement. The sectional area of the piers is sufficient. The girders may be 8 by 5 by 28lb. or 8 by 6 by 35lb. rolled steel joists, these being two of the new standard sections fixed by the engineers' conference and made by Dorman, Long & Co. HENRY ADAMS.

Chances in India and South Africa.

NOTTINGHAM.—F. G. writes: "I wish to go abroad, either to Africa or India. What is the best course for me to adopt and the best time to go? I am about twenty years of age and have a good practical knowledge of plans, details, measuring-up and management of works in course of erection, having been upon factories, sewerage works, &c.; also of office routine and book-keeping, holding at present a position in a large contractor's office."

It is useless to go to India without passing through the Engineering College at Cooper's Hill, which can only be entered after a stiff competitive examination for which twenty is the age limit, the course of training there costing £1,000 and occupying three years. India is ruled, and not colonised, so that only highly-trained men belonging to the governing classes can find openings there, all contracting work being done by natives. If, however, you have a little capital you might very well succeed in time in South Africa; but you would have to go out on your own responsibility and take your chance. It would be better for you to wait for two or three years first, however, few having sound enough knowledge at your age to compete successfully with others in a country to which many good men have gone recently. G. A. T. M.

Obituary.

Mr. John Grey, builder, of Warkworth, died recently.

Mr. William Wimble, F.R.I.B.A., of 9, Queen Victoria Street, E.C., who died on January 12th, aged 54, left property which has been valued at £10,519 gross.

Mr. George Lightfoot, a builder, who was engaged in erecting some houses in Cannon Street, St. Albans, recently died whilst in the execution of his work. His son and other workmen had been with him during the afternoon. As he was cutting laths for use in the construction of the ceiling of one of the rooms he suddenly fell to the floor, dead.

Mr. E. H. Shorland.—We regret to announce the death of Mr. Ernest Hooper Shorland, of the firm of Messrs E. H. Shorland & Brother, of Manchester, which took place at his residence Brook's Bar, Manchester, on March 9th. Mr. Shorland was among the foremost of warming and ventilating engineers, and his firm have carried out, and have in progress at present, some of the most important contracts in the Kingdom. The business of the firm will now be under the active management of Mr. F. H. Shorland, who has been connected with his brother in the business all his life.

Mr. J. B. Pearce, F.R.I.B.A., architect and surveyor, of Upper King Street and Theatre Street, Norwich, died last Monday week, after a prolonged illness. Deceased was the son of the late William Pearce, of Intwood, and was born at South Walsham in 1843. He was educated at Beccles, and afterwards served his articles with the late Mr. Morant, then of Yarmouth, and subsequently borough engineer at Norwich and Leeds. He started in business at Norwich as an architect and surveyor, and he speedily secured a considerable amount of business. He had done a great deal of work for public bodies in all parts of Norfolk and Suffolk, and held the position of architect to the Norwich Board of Guardians and the Forehoe Incorporation. The Yarmouth Town Hall and the Norwich Agricultural Hall are his chief works. He built numerous Board schools, restored a number of churches, and did work in connection with most of the workhouses in Norfolk and Suffolk.

Prof. T. Roger Smith.—We much regret to announce the death on March 11th of Prof. Thomas Roger Smith, of Temple Chambers, Temple Avenue, London, E.C. Deceased had only just resigned the chair of architecture at University College, London, which he had held since 1879. He was elected an Associate of the Royal Institute of British Architects in 1856 and a Fellow in 1863. He was president of the Architectural Association during the sessions 1860-1 and 1863-4. He was district surveyor for West Wandsworth, and for the year 1900-1 Master of the Carpenters' Company, to which company he acted as examiner in carpentry and joinery and in sanitary building construction. He was also president of the British Institute of Certified Carpenters and a member of the Statutory Board of Examiners under the London Building Act, and was an examiner in architecture for the Education Department. His firm, Messrs. T. Roger Smith & Son, were architects of the North London Hospital for Consumption, the Ben Jonson Board School at Stepney, a sanatorium at Reedham, the new laboratories at University College, London, and Elphinstone College and Post-Office, Bombay. He was the author of "Acoustics in relation to Architecture and Building" (Crosby Lockwood & Son); with Mr. John Slater, of "Classic and Early Christian Architecture"; and with Sir Edward J. Poynter, P.R.A., of "Gothic and Renaissance Architecture" (both the latter published by Simpson Low, Marston & Co.).

Bankruptcies.

DURING THE WEEK ending March 14th fifteen failures in the building and timber trades in England and Wales were gazetted.

KING & WILKINS, builders, Sherbrook Road, Fulham. Receiving order made March 11th.

THOMAS WARDEN, builder, 3 Beckenham Road, Leicester. A receiving order has been made on a creditor's petition, the act of bankruptcy being the execution of a deed of assignment for the benefit of creditors.

W. PURKIS, builder, London Road, Braintree. The Official Receiver has issued a summary of the statement of accounts, showing gross liabilities £5,540 5s. 3d. (of which £513 18s. 5d. are unsecured) and the assets £743 7s. 8d.

J. J. AUSTIN, builder and contractor, West Bridgford, Notts. First meeting of creditors held last week at the offices of the Nottingham Official Receiver. Debts £1,392; assets about £220; deficiency £1,170. Mr. T. Leman was appointed trustee, and a committee of inspection was elected.

W. DRABBLE STOKES, builder, Eckington, came up for his public examination at the Chesterfield Bankruptcy Court on March 13th. Liabilities £495; deficiency £214. Failure was attributed to inability to dispose of property, heavy interest on borrowed money, and shortness of work. The examination was adjourned for a month.

JOHN GARNER, builder and contractor. Ruthin. Public examination held last week at Wrexham Bankruptcy Court. Liabilities £428 14s. 3d.; assets £258 15s. The debtor alleged his failure to be due to "losses upon building contracts which he had been taking too low pressure by creditors, and want of capital." The examination was closed.

LUMMIS & SON, builders, Chelmsford. Public examination recently held. Liabilities £1,443 9s.; deficiency, £971 5s. 11d. Failure attributed to loss upon contracts, general decline in value of property, and not keeping proper books of account. The examination was adjourned. At a subsequent meeting of creditors Mr Fred Taylor was appointed trustee.

REUBEN YOUNG, builder, 55 Walbrook Street. Derby. Public examination held last week. Causes of failure stated to be over-speculation, depreciation, bad trade and high price of building materials. Debtor lost £2,410 within four years. The examination was adjourned until April 21st, the debtor being ordered to file a profit and loss account.

BISHOP, PRATT & CO., LTD., builders' merchants. 7, Wormwood Street, London. E.C Meetings of the creditors and shareholders were held last week at the Board of Trade Offices. Lincoln's Inn. Liabilities estimated at £2,688; assets £1.494, exclusive of uncalled capital to the amount of £1,000. The failure of the company was apparently attributable to reckless trading, mismanagement and the large drawings by the managing director for salary and expenses. It was resolved that the matter should remain in the hands of the Official Receiver, with a committee of inspection.

BRICKS. RED BRICK.

A large Stock of best Red Facings, Light, Medium, and Dark. Red Sand Faced. Also Stock of 100 Patterns Moulded Goods of all descriptions, including CHIMNEY POTS, RIDGE TILES, FLOOR TILES. Architects' own Designs to Order on shortest notice.

THE COUNCILS JOURNAL.
MONTHLY, SIXPENCE.

The Councils Journal, the organ of the Parish and District Councils Association, circulates amongst members and officials of Town, District and Parish Councils, Boards of Guardians, School Boards, &c., &c., and publishes a monthly column, "The Work of the Councils," giving information as to Building Works, Sewerage, Gas and Water Schemes proposed by local bodies.

Eyre & Spottiswoode, East Harding St., London, E.C.

A PROFITABLE BUSINESS OF YOUR OWN!

A GENUINE OPPORTUNITY.

Our organization of **AUTOMATIC ADDRESSING BUREAUX**, extending throughout the United Kingdom, offers a splendid opportunity of establishing, in your Town or District, a remarkably profitable business of your own, connected with a co-operative enterprise quite unique in the world. Briefly stated, our proposition is the following:—

If you will establish, in your Town or District, an **ADDRESSING BUREAU**, and agree to organise and conduct same on the lines upon which our own is based, we will grant you a License giving you the right to the use of our name, in addition to other valuable privileges.

Only one License will be granted in each Town or District. There will be no overlapping.

The enterprise is of **FAR-REACHING UTILITY**, and is based on an entirely **NEW BUSINESS** principle.

For full particulars write at once, mentioning this publication and enclosing stamp for reply.

Quantity Surveyors. FROM the particulars given in another column it will be noticed that an association of quantity surveyors is proposed to be formed. We wish the project every success. Quantity surveying has for many years past been more and more assuming the position of a separate and distinct profession. The quantity surveyor is the product of the present contract system, and whilst that system remains the quantity surveyor remains. Too much specialization in any direction is not to be encouraged, but the quantity surveyor obviously performs work which it is hardly possible for the majority of architects to do efficiently in addition to their ordinary duties. The quantity surveyor's duty is to prepare an accurate bill of quantities for the use of builders in submitting tenders, and t is therefore highly desirable that there should be a uniformity of practice so as to ensure equality of tendering. This demands special knowledge. As the quan-ity surveyor's estimates are to be used by he builder, it follows that he must be a practical man, with a thorough knowledge of the way in which work is actually executed. Bills of quantities are got out at he instigation of the client and for his advantage to secure lower tendering and closer competition, for if builders were obliged to take out their own quantities on a big job very few would undertake to ender. Therefore, the quantity surveyor's ees should be paid by the client. And as builders cannot afford time or money to check every bill of quantities (often, indeed, hey do not see the drawings or specification) t is only right these should be included as part of the contract. There are one or two difficulties that arise, however, from the specialization of work. One is that a quantity surveyor is called in at a stage when the drawings and specifications are not quite complete and very few of the details elaborated; in fact, nowadays more often than not, he is called upon to write he specification—a reprehensible practice. He has thus to conjecture the probable orm of much of the work, especially of he details, as it is impossible for him to keep asking the architect a multitude of questions. This difficulty is obviated to a great extent by an architect always employ-ng the same quantity surveyor, who then gets to know his special methods of work. The second objection is that bills of quan-ities militate against the alterations which should be made as the work proceeds, for t is impossible to realize everything until he work is going up. In illustration of this point we need only refer to the custom of builders when pricing out the items to put those which they know cannot be omitted at a very high figure, while others which are likely to be reduced are put at a low price, so that in the end all the profitable work may be left. For this reason, on an important building a schedule of prices would often be better, and then a quantity surveyor would not be needed. But while the quantity surveyor remains he deserves every consideration; and we are therefore glad to see an association formed to look after his interests.

St. Mark's Campanile. THE Royal Academy Fund in aid of the rebuilding of St. Mark's Campanile is proposed to be closed during the second week in April and the contributions forwarded to the Sindaco of Venice before the 25th of next month, on which date it is hoped the foundation-stone of the new tower will be laid. Up to the present about £260 has been collected, and on looking at the list of subscribers one does not find that the proposal has been supported much by architects - only three names are there, Professor Aitchison and Mr. Bodley (£5 each) and Mr. Saxon Snell (£2 2s.). "Artists" and "art patrons" seem to make up the bulk of the subscribers, and thus we find Mr. Abbey, Mr. Seymour Lucas, Professor Herkomer and Sir William Richmond sending £5 each, Mr. Luke Fildes and Sir Lawrence Alma-Tadema £10 each, and Mr. Orchardson £10 10s.: while, as regards the sculptors, Mr. Colton has subscribed £2 2s., Mr. Brock and Mr. Frampton £5 each, and Mr. Thornycroft £5 5s. The list is indeed very characteristic of those who want the Campanile back again as it was. It is "artists" who want this—"artists" who have known Venice and desire their impressions of it to remain unaltered. We appreciate their view of the matter, but have contended from the first that if the Campanile was to be rebuilt at all it ought to be a new design and not a mere duplicate. Everyone will admit that the old tower dominated the basilica to such a degree that the proportions of the latter were greatly depreciated. Now that it has fallen, the basilica "shines forth in augmented astonishing splendour." The rebuilding about to be commenced is largely a matter of sentiment. The old Campanile claimed interest for its age, if not for its intrinsic merit. The new one can have no such interest. It will be a mere duplicate, a sad acknowledgment to future generations that we could not trust ourselves to build a tower embodying the spirit of the century in which we live.

The Sanitary Question at Nottingham. MUCH attention is at present being directed to the sanitary system at Nottingham, and it is a matter which concerns many other towns as well. The waste-water closet system was adopted at Nottingham five or six years ago, and it has proved so unsatisfactory that the Health Committee of the Corporation propose to abandon it, stipulating that all newly-built houses and buildings shall be supplied with a *water-closet* approved by them. The supply of water to the town and its suburbs averages about 26 gals. per head of the population, which, compared with the London average of 40 gals., is scanty: and so, with the object of saving water, there are several systems of sanitation to be found in the town. The earth-closet or "ash-pit" system is in use, the "tub," several varieties of waste-water closets, and, in the better-class property in the Park, the ordinary wash-down closet. Several of these systems are frankly insanitary and have lately been severely condemned—the earth-closet and "tub" systems in all except the most rural districts are very bad ones – but more especially the waste-water closets have been under consideration. There are 40,000 of the "tubs" at Nottingham. As to the waste-water closets which were adopted to gradually supersede these "tubs," it has been objected, first, that the water used is little better than sewage; that a large amount of fatty material and vegetable matter collects in the sinks of the houses, corroding and caking the tippers to a very objectionable degree; and that they are most liable to get out of order. There can be no doubt, however, from the experience of other towns, that the waste-water closet system can be a thoroughly sanitary one: and it seems probable that at Nottingham the closets are either improperly used or they are not of a good pattern. Opinion on the matter is much divided among members of the Corporation, and the long debate which recently took place resulted in a motion for adjournment being carried. Meanwhile the Health Committee find themselves in a difficult position. They do not propose to touch the 40,000 "tubs" already existing, stipulating only that there shall be no more of them. Doubtless the replacing of these closets by others flushed from a cistern would entail much hardship on some property owners; but this seems to be the only practicable way of abating the nuisance, for though the new closets might give no trouble the old ones would be as bad as they are now: and it is their present insanitary condition which is causing anxiety.

SOME CAMBRIDGE COLLEGES.

By **J. A. T. HOUSTON.**

(Concluded from p. 66 of No. 423.)

It is necessary to trace some of the buildings prior to the foundation of the actual Trinity College. King Edward's tower was built during 1426-37, and was taken down and rebuilt in 1600, forming the present entrance to the chapel.

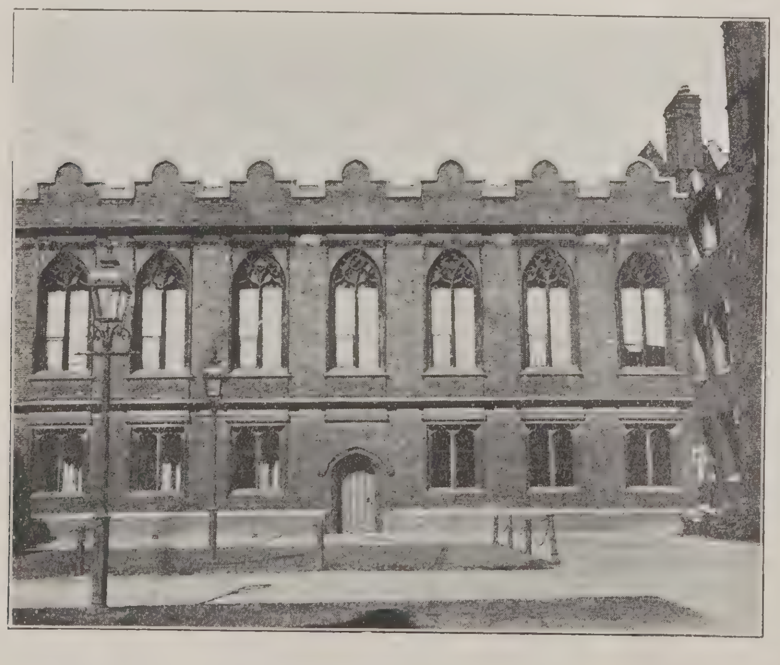
A small chapel was built during 1464–84, occupying twenty years in construction and being finished at the beginning of the reign of Richard III. The great gateway tower which now forms the principal entrance to the college was commenced in 1518, and 1535 saw its completion.

When the site was handed over to the community by Henry VIII. they found themselves in the possession of one chapel, three halls (King's Hall, Michael House, Pyswick Hostel), the chambers of these three bodies, and a few other subordinate hostels. At this time King's Hall had a community of fifty persons; Michael House, twenty-one; and Pyswick Hostel, forty persons. In order to bind this into one establishment, enlargement was rendered necessary. In 1551 we find the destruction of Michael House and Pyswick Hostel is being proceeded with.

The college had obtained from King Henry a gift of the site and buildings of the Grey Friars, and this they used as a quarry. In 1554 the college appears to have drawn up a scheme for its complete reconstruction. They started with a range of chambers which were subsequently pulled down by Dr. Neville. These chambers occupied the north-west corner of the great court. The years 1555–64 saw the building of the chapel. The first range of buildings was authorized by Philip and Mary. They had at this time two sites for the building of the library. The college seemed very fond of the idea of raising the library on a cloister, as was actually carried out by Wren in his fine building in Neville's Court.

In 1593 Dr. Thomas Neville was appointed master, and remained so for twenty years, and to him the college owes its present noble scale. The following account of his labours is reduced from a record of the time:—When he first came to the college he was struck by the remarkable absence of beauty in the buildings, and he set himself diligently to the rebuilding of the college. When he had completed the great quadrangle and brought it to a decorous aspect (for fear the deformity of the old hall, which through extreme old age had become infirm and ruinous, should cast as it were a shade over its splendour), he himself provided funds for the building of a great new hall, worthy of the quadrangle. In these additions he acted under the advice of Ralph Symons, who had already acted as architect to Emmanuel College, and who designed the second court of St. John's College later. Neville built the south side of the great quadrangle and Queen Tower, 1594–97, and in 1600 he pulled down the range of buildings erected just before and adjoining the chapel which destroyed the symmetry of the quadrangle. He took down and erected King Edward's Tower as an entrance to the chapel, and erected the master's lodge. This course, no doubt, was suggested by Ralph Symons, and it has left us with the most spacious quadrangle in Cambridge.

CUPOLA TO DINING-HALL, CAIUS COLLEGE, CAMBRIDGE. DRAWN BY J. MYRTLE SMITH.



THE LIBRARY, ST. JOHN'S COLLEGE, CAMBRIDGE: FRONT TO QUADRANGLE.

The hall referred to above was commenced in 1604 from designs by Symons, and finished in 1605. The hall was, for the time, built with extreme rapidity, occupying only eighteen months in construction. The kitchen was even more rapidly erected, as the foundation-stone was laid on July 7th, 1605, and the last slater's account paid by November 24th of the same year. Before designing the hall they took the very sensible course of examining some existing halls. They selected the hall of the Middle Temple as the most suitable, and there is a record of their visit to London concerning it. Both halls are of the same dimensions—100ft. by 40ft. by 50ft. high. This completed the building of the great court.

Neville, at enormous cost to himself, next set himself to the building of the second court in 1614, known as Neville's. This was built in a Jacobean manner, and was repaired and Italianized by Essex in 1755. In 1614 the great tower at the entrance gateway was raised and beautified, and the figures, which were carved in London, were placed in position. Neville died in 1615.

In 1705 they erected an observatory in the roof of the gateway, but this was removed in 1797. The great court measures:—West side, 340ft.; south side, 288ft.; east side, 325ft.; north side, 257ft.

In 1750 the whole of the great court, or nearly all, was stuccoed and generally repaired. In 1775 the architect Essex Italianized the south-west corner, and it was intended to treat the whole court in this way, but it was never carried out.

We will next turn our attention to the new library, which forms the west side of Neville's Court. This building was designed by Sir Christopher Wren, who rendered his services gratuitously. Wren probably did this because he was a close friend of Dr. Barrow, who was the master of Trinity from 1673 to 1677. Wren made two designs for this library. The first was a circular building 90ft. high by 65ft. in circumference, covered with a dome and cupola, and this idea was actually carried into execution at the Radcliff Library, Oxford, by James Gibbs. After this design was made, the college decided to lengthen Neville's Court, and this rendered the circular design unworkable. The present design is said to owe its inspiration to the library of St. Mark's, Venice. Wren made six drawings of his design and sent careful written instructions explaining it.

To use Wren's own words, he says: "I chose a double Order rather than a single. A single Order must either have been mutilated in its parts or have been very expensive." He further says: "I suppose you have good masons, however. I would willingly take further pains to give all the mouldings in great. We are scrupulous in small matters, and you must pardon us. The architects are as great pedants as the critics or heralds."

There are records of the mason going eight times to London to consult Sir Christopher during the course of the work, which was commenced in 1675 and occupied twelve years in construction. Ketton stone was used.

The woodwork, which is of very fine design, and is, if I remember rightly, of Normandy oak, was made by Corneilius Austen, who twice visited Wren regarding it. The woodcarving is by the famous Grinling Gibbons. The statues represent Divinity, Law, Physic and Mathematics; they were cut in 1681 by Gabriel Cibber. The classical composition opposite is probably also by Wren, but it is not nearly so finely detailed. The entire Library was completed in 1695, at a cost of £17,000. The ceiling was left plain, but was executed in 1850 from a design left by Wren. The college remains now practically as when it was left in the twelfth century, and no buildings of any extent have been erected during the modern period. This finishes Trinity College.

Other Colleges.

Caius College: Gate of Honour.—This very interesting relic was designed by Theodore Haveus or Heave during 1574–75. It was one of the first attempts at the new Italian style in England.

Clare.—The bridge was designed and built by Robert Grumbould at a cost of £284. He received 3s. for the design. The river-front was built in 1671, and the side next King's during 1646 and 1642; the quadrangle and gateway in 1388.

Emmanuel.—Founded by Sir Walter Mildmay, 1584. The original college was built by Ralph Symons, but little now remains. Symons is referred to as "a well-minded man toward Emmanuel College so lately founded and newly builded, the workmanship whereof touching the stonework hath been wrought and performed by the said Ralph Symons wherein he hath shewn himself very diligent and careful." The chapel was designed by Wren in 1667. The founders' range with the beautiful Ionic doorway was rebuilt in 1719

Pembroke.—The chapel was built by Bishop Wren from plans by his nephew on his release from the tower in 1665.

Peterhouse.—Wren's uncle was master here. The chapel was built by him (1635). It is often attributed to Sir C. Wren, but wrongly.

Queen's.—Bridge built 1749; principal court, 1448; cloister court, 1484–94.

Senate House.—James Gibbs, architect, 1750.

St. John's.—The first court of St. John's was built during 1510–20. The second court was designed and carried through by Ralph Symons and Gilbert Wigg from 1599 to 1602. In an old document they are referred to as undertakers. They did not make a satisfactory job, as we read that the undertakers were undone; for Wigg was landed in prison, and it was also disastrous for Symons, as he lost a hand by accident, and thereafter left Cambridge and appeared no more. Third court, 1669–1712; library, 1623–28; bridge with gateway, 1696–1712; new chapel, 1669; new court, 1825.

Christ's.—Gateway front, 1714–38.

St. Catherine's.—This college was founded by Robert Wodelarke (the same who got into trouble at King's). It was entirely rebuilt through the energy of Dr. Eachard, master, 1675–1697. Chapel with Ionic doorway, 1704; other building of similar design to the chapel, 1757.

The development of collegiate architecture is perhaps one of the most interesting phases of building, preserving as it does the method in which past generations have thought and worked and handed down to us their traditions as an architectural birthright. The gradual building of these colleges, too, shows us the change from style to style. In reading the records of the time one is struck by the spirit in which everything was conceived. They were quite as commercial and hard-headed then as now.

People speak nowadays as if all the old and good work was done by architects working regardless of requirements and cost, a kind of ideal existence possible only in Heaven. If this was so, they worked without a problem to solve, and without a problem you can have no solution. To each problem there is but one solution—the logical one—and that solution is only obtainable after trying every other conceivable and inconceivable one, trying every short cut and subterfuge and trick of the trade or tradesmen. These old architects used a logical method of getting their solution. If a building was too small or ruinous and wore itself into a hole on one side, they did not patch it up with material of the same pattern that had been out of stock for some years, but used the latest pattern. They were in fact rather proud of their new patterns, which were arrived at as improvements or by reason of increase of knowledge.

I have thought it necessary to give you this short history of King's and Trinity, as the spirit in which the work was conceived and carried out is as important as the work itself.

The buildings have been reared by the toil and philanthropy of some and the love of others, and consecrated by the prayers of generations; and though the ideal has fallen far short in execution (as at King's), yet as the shadowy substance of what might have been, and is not, passes before the mind's eye one may bestow, for the thought, a passing blessing on a long-forgotten and profligate King of England.

[For the historical matter of this paper the author is indebted to the following works:—Reginald Blomfield's "Renaissance in England"; Belcher and Macartney's "Later Renaissance in England"; J. Alfred Gotch's "Early Renaissance in England"; W. J. Loftie's "Christopher Wren"; and Wells and Clarke's "History of the Colleges of Cambridge."]

A new Organ for Christ's Hospital is being erected in the chapel at Horsham. It was constructed by Mr. A. Kirkland, of Upper Holloway. The handsome oak case was designed by Messrs. Aston Webb & E. Ingress Bell, architects of the Institution.

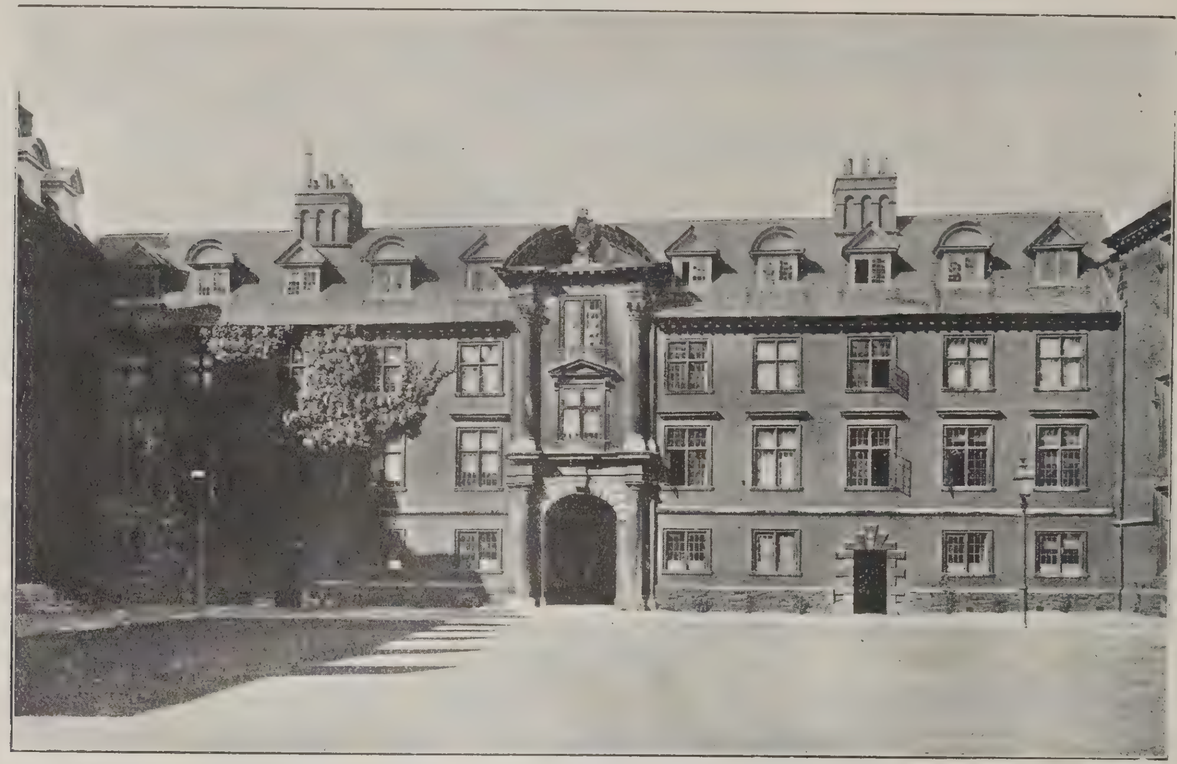
EMMANUEL COLLEGE, CAMBRIDGE: THE CHAPEL.

THE ARCHITECTURAL ASSOCIATION.

TOWN HOUSES.

A MEETING of the Architectural Association was held last Friday, Mr. Henry T. Hare presiding. It was announced that Mr. S. D. Adshead had been reinstated a member of the Association, and that the following donations to the New Premises Fund had been received:—Mr. Thomas Blashill £10 10s., Mr. Sidney R. J. Smith £5, Mr. T. C. Agutter £3 3s., and Mr. W. G. R. Bousfield £2 2s. A vote of condolence with the family of the late Prof. T. Roger Smith was then passed. The list of nominations for the officers of the Association to be elected for the next session was read, and included the following:—Mr. Henry T. Hare, president; Messrs R. S. Balfour and Arnold Mitchell, vice-presidents; and Messrs. H. P. G. Maule and H. Tanner, jun., as hon. secretaries. Mr. Henry White, A.R.I.B.A., then read a paper on "Ancient and Modern Town Houses; or the Evolution of Domestic Architecture in London." He referred to ancient town houses at length, and then went on to treat of modern houses in detail. The following is a summary:—

It appears to have been the rule until quite recent times to have spent whatever time and thought was given to the planning of houses on the ground and first floors, the basement and upper floors being fearful and wonderful. It was all for "my lord and lady," and let the serving men and women shift for themselves; "live, and be thankful,"



ST. CATHERINE'S COLLEGE, CAMBRIDGE: FRONT TO QUADRANGLE.

was thought good enough for their motto and they accepted the situation. The reception rooms having been planned, the bedrooms, children's and servant's apartments had but little attention bestowed upon them, and were more often than not badly lighted, badly arranged, and, to use a paradox, low in height. It is extraordinary why the early builders should have ever willingly burrowed down into the earth and increased their difficulties as to lighting and draining to such an extent.

The brothers Adam, while adopting the characteristics of the vernacular style, impressed an individuality and refinement of detail on their work which does not appear to have been attained by any architect since. Examine the illustrations of their work and the skill in the "design" of their plans, the symmetry, proportions, and refinement of detail in their decorations, and remember that they could and did treat their decorations architecturally; each reception-room, hall and staircase being separately studied and treated—walls, ceilings, floors, chimney-pieces, windows, doors, and even the window and door fittings and the furniture were designed in the same style and scale as the house and with the same delicacy of detail.

The fenestration in the work of the brothers Adam was designed to show the relative importance of the rooms, but (with the exception of the drawing-room floor) the windows in many cases were too small to properly light and ventilate the rooms; and it is curious they failed to realize the great defect which a centre pier between two windows produced as regards the effective lighting of a long room end on to the front.

The question of fenestration, formerly the keynote to the design and proportion of house fronts, seems in much of the work now being done to be relegated to the background—if not, indeed, forgotten in the craze for novelty of arrangement regardless of the position or needs of the rooms.

The lower rooms, although requiring the largest windows in proportion to their size (particularly in narrow streets), are frequently under-lighted, whilst the upper floors are over windowed, and the desire for variety is allowed to dominate the whole character of the front. This criticism applies to town house architecture, not blocks of flats, where each floor is almost of the same importance.

The work of John Nash had none of the refinement of detail of the brothers Adam, although one quality of his work—namely, breadth of effect, grouping, and balance—is well worth studying.

Until some of our prominent estate owners make the opportunity by dealing with blocks of houses at a time instead of solitary slips, there appears little chance of any change from the kaleidoscopic effects in our streets which our present lack of system and scheme produces.

In dealing with recent work it is difficult to differentiate between the characteristics of the plans of various architects, and it would be necessary to devote a special paragraph to the work of each man to bring out these points, but a study of the plans which have been published shows that in later years much has been done to give greater individuality to the plans of even ordinary terrace houses than was formerly the case; but a writer has truly said that, "except in the minority of instances, town houses are not built by the men who inhabit them, and, in rarer cases still it is where ground values and questions of light and air do not entirely overrule the æsthetic influences of architecture itself." Indeed, most of the best modern work is that which has been done by architects for special clients to meet the latter's particular requirements; further, the site and its surrounding in many cases dictate the general laying-out of the plan.

Aspect must also be considered as far as possible, even in smoky, murky London.

Planning is, perhaps, not quite so interesting to students as designing the elevations, and yet the importance of the plan *cannot* be overrated; and the art or science of planning, as shown in the works of the best masters, is a very different thing indeed from that which comes from less able hands, and most certainly does "count."

Having received instructions to build a house in London—say, upon the site of an old one—the architect should study as far as possible the client's mode of living, his "hobby," and the accommodation he requires, and must not forget that "cost" will enter largely into the question and enhance his difficulties.

Further difficulties may then present themselves in the shape of Acts of Parliament and L.C.C. by-laws; and neighbours' rights (vested interests), if neglected by the architect, will probably land him and his client into sad trouble and worry.

In building upon a large estate other difficulties may be presented. The owner's and his surveyor's views require special attention, and the popular cry against the ground landlords naturally make them desire to meet their tenants in some instances, and otherwise sometimes compromises have to be made, and the architect's hands are by no means unfettered.

In the modern town house of the terrace type, whether the frontage be 20ft. or 30ft., the problem is much the same; that is, the same number of rooms—in a given locality—will be asked for, the keynote being the relation of the hall and staircase to the rooms.

Modern ideas as to the position of the sanitary block have completely changed his type of plan since the Adam's time. Most people want to enter their rooms direct from the hall or corridors, and require that the rooms be not "passage" rooms from one part of the building to another.

There is a tendency (upon restricted sites) to omit the morning-room and to enlarge the hall and make it more like a room; there is no doubt a considerable charm in this type of plan, and where the staircase is well treated and is not allowed to take up too much room the hall becomes a useful lounge. A good fireplace is essential if it is to be so used, and well-arranged radiators materially add to the warmth and comfort of the house.

If a staircase from the basement to the outer hall can be obtained, the inner hall is less liable to disturbance by the entrance of servants.

Such a plan often permits of side-lighting from an area which is most desirable, but usually the space given up to the area is not sufficient—the air is stagnant, and very little light is obtained, the result being again unsatisfactory. If "pairs" of houses can be built the areas become double in size so far as light and air go, and this is a great gain to both houses.

The usual "Adam" staircase is top-lighted, and although in many cases this has been effectively treated the great defect is a gloomy hall. This can in some cases be avoided, and in a Harley Street house a window has been introduced upon each half-landing in addition to a good lantern-light—thus flooding the hall and staircase with light and giving ample ventilation, which is not to be obtained by the merely top-lighted staircase. This is a simple solution of the problem, and might be more often adopted with advantage. It breaks up the long shadows cast by the upper flights of stairs and landings, and gives a sense of brightness and airiness which has proved attractive.

There is another determinant as to the position of the staircase, and that is the planning of the drawing-room. If double or connected drawing-rooms are required the staircase cannot be taken up between the rooms in the ordinary 20ft. to 30ft. frontage; if, however, connected rooms be not required, and the site is sufficiently deep, a central staircase lighted either from the top or from an area, or from both, can be obtained, and examples of this type are worth studying.

A second staircase should, wherever possible, be provided; in the smaller houses, of course, it is not possible, and its substitute, although sometimes practicable, is expensive—it is a small passenger-lift. But unless this can be worked by electricity, and arranged to be used without a special attendant, it is not of much use.

Whilst dealing with the position of the staircases the relations of same to the kitchen is of great importance. In some of the old plans the service appears to have been almost lost sight of, and the labour to the servants must have been immense, and would not be tolerated by the present-day domestic servant.

In the smaller-sized town house it is not always possible to have a central or even an important staircase, but a well-designed one adds to the character of the house, and the very ordinary straight flight may be varied by reversing the bottom steps and thus, by a little contriving, a position is secured for a fireplace and the ordinary "passage" effect is avoided.

The rooms upon the ground floor usually required are a good dining-room (and remember that 15ft. in width is the minimum for comfort), a library and morning or own room, and a billiard-room is now more often asked for than formerly. If space be limited upon the ground floor a billiard-room can often be devised in the basement; but in such cases a staircase separate from the servants' stairs should be arranged so that access can be obtained without passing through the servants' rooms. The gentlemen's water closet and lavatory should be upon the ground floor, and well screened.

Passing to the drawing-room floor, we have to decide whether there are to be two drawing-rooms or a single drawing-room and boudoir, with perhaps a guest's bedroom.

For the ordinary house a large drawing-room, with smaller back drawing-room with large doors between and a small boudoir, is a very useful arrangement. If possible a water-closet and lavatory should be provided upon this floor, if a well-screened position can be discovered. If a guest's bedroom be planned upon this floor, a dressing-room and bathroom and water-closet is very desirable, and unless space prevents should be arranged.

The second floor is usually given up to the heads of the family, and ordinary requirements demand a good bedroom with dressing-room (large enough to use as an extra bedroom), bathroom and watercloset, and one or two smaller bedrooms. The principal staircase can sometimes with advantage terminate on this floor, and the back staircase become the staircase to the upper floors; but it should in such a case be well arranged and of more importance than the ordinary back stair. The drawback to this plan is that it becomes common to the family and servants. A skilful planner can often solve this difficulty, however.

The third floor usually follows the arrangement of the second floor. If there are children to arrange for, then special planning is required, and the accommodation should consist of a large dayroom, two or three bedrooms, bathroom, water-closet, nursery pantry with sink, small larder, linen store, and plenty of cupboard accommodation—and a lift in the case saves much labour.

ST. CATHERINE'S COLLEGE, CAMBRIDGE. FROM A WATER-COLOUR DRAWING BY PERCY E. NOBBS, M.A., A.R.I.B.A.

On the fourth floor the servants' bedrooms, boxroom, cistern room, and, if possible, isolation-room, should be arranged, with easy access to the roof and from there to adjoining roofs in case of fire.

It will not be necessary to describe in detail the rooms required in the basement, but only to insist that their proper relation to each other is of the utmost importance for the economical working of the house.

It was time that the old order gave place to the new, and that the comfort and welfare of the servants be taken into consideration, for without such consideration the comfort of the owners and occupiers must certainly be lessened, and an abnormal staff of servants will be required to do the housework.

There are numerous small points that go towards the proper equipment of even an ordinary-sized town house. Amongst them may be mentioned:—Plenty of cupboard accommodation and good linen stores—but see that these are in good positions. A carefully arranged dinner and service lift from the basement to the top floor, if possible, and large enough for coals and ordinary luggage, should be arranged. The well of the back staircase is a good position, but this sometimes is farther from the dining-room than is desirable. Telephones or speaking-tubes from each floor to the basement saves much labour. Hot- and cold-water service upon each bedroom floor, and at least two bathrooms, are required in a well-arranged house of the class we are considering. The careful arrangement of the electric lighting to control and to avoid waste must be studied, and the architect is the proper person to arrange these matters, which should be thought of when the plans are being made to avoid trouble and annoyance afterwards. The Public Health by-laws must not be forgotten, and the proper arrangement and disposition of the bathrooms, water-closets, housemaid's sinks, &c., if not well considered in planning, lead to trouble and waste of money to an alarming extent.

Most people require houses to live in. We should therefore strive to concentrate the work of the house to make it, as far as possible, bright, cheerful, and well arranged and well constructed. Give every opportunity to let such sunshine as we are blessed with enter the house wherever possible, and by so doing you will add greatly to the health and comfort of its occupants.

Prof. Beresford Pite, in proposing a vote of thanks to the author of the paper, thought the plans of old town houses could hardly be criticised from present standards, for each one of these houses represented a manner of life just as our houses represented one.

Mr. Max Clarke seconded the vote, which was supported by Messrs. T. H. Watson, H. S. Collings, H. Lovegrove, Francis Hooper, James Boyton, John Murray, Dr. A. W. Voelcker and Henry T. Hare.

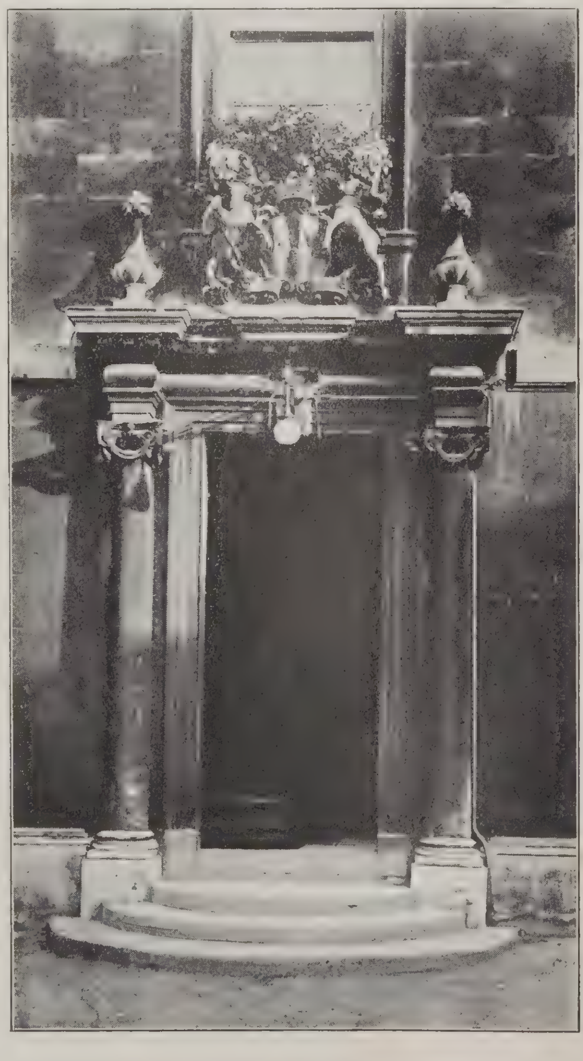
WESTMINSTER CATHEDRAL.

PROFESSOR BERESFORD PITE, after the reading of Mr. Charles Hadfield's paper on Westminster Cathedral before the Royal Institute of British Architects (reported in our last issue), said the cathedral was the work of a very singular man, a man of powerful artistic character—the work, in fact, of a great man, for there was no suggestion in it of the Philistinism of the age in which it was built. How far that philosophy was justifiable was another matter. Of Bentley as an early Gothic architect they knew from Mr. Eastlake's book on the Gothic Revival—a man of refined mind with something of Burges's strength of design. Then came that extraordinary church at Watford and the church in Cadogan Square showing an equal grasp of later Gothic. But from Watford to Westminster was a very long cry. The placing of a large commission in his hands seemed to have quite upset Bentley's preconceptions: and of all places from which to draw inspiration for a London cathedral, Ravenna, in the fever-laden marshes of the Adriatic, struck one as extraordinary—strange indeed that he should have gone back to the earliest of Christian architecture in the East, at the same time setting aside the central grouping invariably connected with it and devoting his whole attention on a great nave—a Gothic nave like that of the Cordeliers at Toulouse translated into a simple domed nave, based on the same principles of lighting and buttressing but cut loose from Gothic in its detail, and from all Classic or Renaissance tradition. Of Bentley's dreams for the beauty of that vault they could not conceive, but he (Professor Pite) suspected St. Mark's, Venice, on a large scale. That, however, was a thing of the past, and they had to be content with it as they saw it, magnificent in bare brickwork. The plan had unfortunately cramped the exterior; Bentley seemed to have felt this, so that he devoted his whole attention to the mass of the nave and the lofty campanile Whatever one's opinion might be as to details, here was the work of a great man, the embodiment of a great scheme for which we might be thankful.

To Mr. Walter Millard the contrast between the interior and the exterior was hardly reconcilable, and he could not help wishing that the great power expressed in the interior, of producing noble effects by apparently simple means, had been exercised on the exterior. The design seemed to him to be that of a man who looked at architecture as a whole, and the lesson it taught was self-reliance and unwearying effort

Mr. Aston Webb believed the cathedral would have a greater influence on the younger men than any other building erected in recent times. The plan had been the basis of its design; design was influenced by construction, and construction by design—the essential of true architecture. One saw the man himself in every corner, in every arch, in every moulding and detail—the man's very life built into his work.

Mr. Hadfield said he could not presume to know the mind of Bentley, who was singularly secretive and did a thing without saying much about it. Byzantine was, of course, not new to him, and when, after receiving the commission, he went to Italy, it was but to concentrate the study of years. The whole history of the cathedral seemed to him that Bentley was given a thing to do, that he chose what seemed to be best for his purpose, and spent his life-energy in carrying it out.



EMMANUEL COLLEGE, CAMBRIDGE: DOORWAY IN FOUNDERS' RANGE.

SOCIETY OF ARCHITECTS.

VENTILATION AND WARMING.

A MEETING of the Society of Architects was held on Thursday last, when a paper on ventilation and warming was read by Mr. B. R. Tucker, M.S.A., M.S.I., late Chief Surveyor, War Office.

After referring in some detail to the composition of air and its impurities Mr. Tucker went on to deal with systems of ventilation. He observed that in our climate we nearly always had a lower temperature outside a building than inside, which ensured the chief element required for natural ventilation. Artificial ventilation was divided into two systems, the "vacuum" and "plenum," or extraction and propulsion, each of which had its advocates, but of both it might be said that they were costly in working, besides requiring great care in management.

In the vacuum or extraction system strong currents were produced in the outlet or up-cast shafts by means of hot-water or steam coils, or by exhaust fans. There was an objection to this system when the current in the up-cast shafts was sufficiently strong, as it then caused every aperture to become an inlet, drawing impure air from sources not intended. There was also another serious difficulty in buildings having only one up-cast shaft, the rooms most remote from it scarcely getting any current at all. For these reasons this system was in little favour.

By the plenum or propulsion system, unlike any other, the air could be taken from any desired source, away from contamination; it could not be filtered, washed, warmed or cooled, as desired. It was then driven by fans through tubes or ducts (generally placed in the basement); from these it was conveyed by up-cast shafts to the several rooms, &c., the air in each case discharging by a hopper-mouthed louvred opening (the louvres fixed at an angle of 40 degs.), so that the air might impinge against the ceiling. The opening was placed not less than 7ft. 6in. above the floor, so that the air might discharge over the heads of the occupants; it then struck the opposite wall, where it descended (split up), returned across the room to the foot of the wall at which it entered, and was here forced into outlet shafts, the openings of which were at the floor-level. In the case of very large rooms the inlets might be on both sides of the rooms, and the foul air drawn through apertures formed at intervals in the floor. In any case the position of the outlet should be such as would ensure an absence of inconvenience and draught.

Mr. Tucker continued:—In no case should cold fresh air be drawn through the floor, or draughts will be produced about the feet of the occupants. The outlet shafts should be carried up through the roof, and terminate each with a louvred top at some height above the ridge of the roof.

The advantages of this system are—

(*a*) The purest air available can be used.
(*b*) It can be cleansed, warmed or cooled, as desired.
(*c*) It can be changed, even eight or ten times in an hour, without causing draughts.
(*d*) Can be equally distributed to every part of the room.
(*e*) All vitiated air can be driven out.
(*f*) Efficiency is secured independent of the force of the wind.

The disadvantages are—

(*a*) The long lengths of tubes or ducts so necessary to this system which are liable to become coated with dust, and, consequently, be a means of polluting the air as it passes through them.
(*b*) The great cost of the installation and the constant cost of working it.
(*c*) Great care and intelligence required in working it

Domestic Rooms.

Each room should be supplied with fresh air by means of a suitable ventilator having an adjustable valve controlled by a cord. It should be fixed in a drop-channel opening in the outer wall near the ceiling and farthest from the fireplace. The opening should be protected on the outside by a galvanized hinged grating. The foul air should escape by means of a flue, of suitable size, formed in the chimney stack between the smoke flues, with an opening into it near the ceiling protected by a grating. The heat of the smoke flues would ensure a more rapid escape of the foul air. The products of combustion from gas should be conducted into the foul-air flue by means of a ventilator in the ceiling In certain cases, as in living rooms, a portion of the incoming fresh air might be warmed by means of a ventilating grate of approved construction. All inhabited rooms should have fireplaces for ventilation.

Large Rooms, Halls, Churches, &c.

In this class of building the fresh air is usually supplied by means of Tobin's tubes. These should be of a suitable size and sufficiently numerous to ensure that the air is sufficiently split up so as not to produce a draught. When practicable, the fresh air passing through them should be warmed by means of hot-water or steam coils, placed in suitable chambers in communication with them. The air should enter the Tobin's tubes as much above the ground as practicable, to avoid ground impurities. It is advisable to place "direct" or "direct-indirect" radiators under the windows. If desired, they may be placed in cases or chambers; this is a good arrangement, as it effectually prevents cold draughts being produced by the cooling effect of the glass of the windows. The foul air should be removed by exhaust shafts terminating above the ridge of the roof, each surmounted by a cowl having considerable extracting power when acted on by the wind—when there is no wind the current should be maintained by gas jets, or a hot-water or steam coil placed in the lower end of the cowl, or by a cast-iron stove-pipe fixed in the centre of the shaft terminating above the cowl.

Hospital Wards.

It is possible that, as a rule, natural ventilation is best suited for hospital wards, especially when they are of ample cubic capacity, particularly as the open-air treatment by widely-opened windows is now being practised, even in certain London hospitals, with beneficial results. No doubt, air maintained at 60 degs. Fahr., as in the plenum system, is somewhat enervating and depressing for hospitals; whereas the results of the open-air treatment would appear to show that a good supply of fresh cool air invigorates the system and increases the power of its resistance to germs, inasmuch as cool air is condensed air and consequently imparts a larger quantity of oxygen into the system.

Schoolrooms.

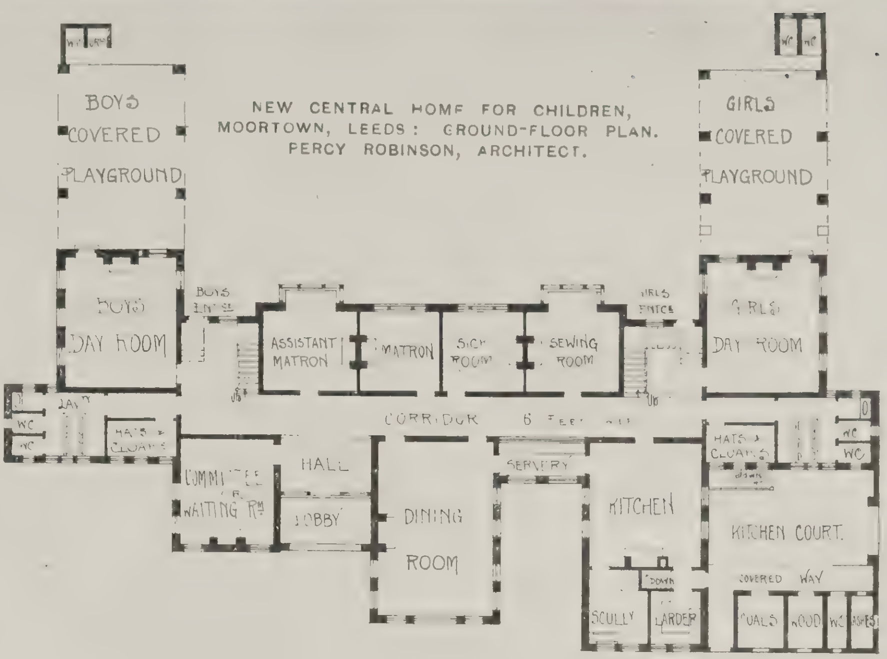
It is maintained on good authority that the plenum system is the best for large schoolrooms, as it ensures an equal distribution of warm pure air to each scholar. It has been ascertained that more mental vigour and increased working power are obtained with this system of ventilation than with natural ventilation. It is stated that Dr. Kerr's observations made on the air in natural- and mechanically-ventilated schools at Bradford, when over 250 tests were made for CO_2 during $2\frac{1}{2}$ hours of afternoon school-work, showed that in the naturally-ventilated schools the CO_2 gradually increased from about 0·8 up to about 2·8 volumes per 1,000 cub. ft., whereas in those mechanically ventilated the amount of CO_2 remained steadily at 0·8 per 1,000 cub. ft. all the time. The plenum system would be too expensive for small schools, consequently natural ventilation must be employed in these.

Barrack-rooms.

Perhaps there is no instance where ventilation is put to so severe a test as in barrack-rooms. The cubic space allowed is 600 cub. ft. per man, and the inlets and outlets for air are equal to 10 sq. in. per man. Half the quantity of the incoming air is warmed by the ventilating grate. The result of this system of ventilation is found to be satisfactory, although the area of 10 sq. in. would appear too small. No doubt a quantity of fresh air is admitted in this, as in other cases, by the doors and windows and carried off by the chimney flues; in this way it is possible each man may obtain 3,000 cub. ft. of air per hour—the air being changed probably about five times during that period.

Size of Ventilator and Flues.

This is important; it is, however, impossible to lay down a hard-and-fast rule. Generally, it is considered that 24 sq. in. of area per individual—independent of the chimney—will be found sufficient. Less than this will be sufficient if the outlet shafts exceed 25ft. in height. A velocity of 5ft. of air per second through an area of 24 sq. in. will produce 3,000 cub. ft. per hour—the quantity required. It should be stated that the foregoing quantity makes no allowance for a large supply of air which enters by the doors and windows, also through the walls, which are somewhat porous, and escapes up the chimney flue. Probably from 30 to 50 per cent. might be deducted as approximately representing this quantity, especially as an ordinary fire requires 3ft. to 4ft. of draught per second and a strong fire about 6ft. A velocity of 5ft. per second at the ventilators will not produce more than about 3ft. in the room, which is the maximum that can be endured when the temperature is about 50 degs. Fahr. The lower the temperature the less should be the velocity: 1 ft. per second is sufficient when the temperature is about 35 degs. Fahr.



NEW CENTRAL HOME FOR CHILDREN, MOORTOWN, LEEDS: GROUND-FLOOR PLAN. PERCY ROBINSON, ARCHITECT.

Position of Inlets and Outlets.

We may observe the following rules:—

(*a*) When the air is warmed before it enters the room it should enter at about 7ft. 6in. above floor-level on the opposite side to the fireplace (if any), and pass out at the floor-level on the same side of the room.

(*b*) When the fresh air is warmed by being heated in the room—by open fires, stoves, &c.—it enters cold about 8ft. from the floor, and it consequently falls to the floor underneath the foul or warmer air that has been longer in the room and which should pass out at ceiling level. In fact, it all depends upon the relative temperature of the air entering the room, as that is fresher than the air which has been longer in the room; if that is warmer than the air in the room, then there should be openings provided for the escape of the cooler and denser foul air at the bottom of the room. If, on the other hand, the air entering the room is cooler than the air longer in the room, then there should be openings for the escape of the warmer and lighter foul air at the top of the room.

Air-Space per Individual.

Natural ventilation requires more air-space per individual than is the case with artificial ventilation. The following are the requirements for some buildings:—

London School Board ..	130	cub. ft. per	scholar.
Common lodging-houses ..	300	,,	person.
Factories and Workhouses { day-time ..	250	,,	,,
Factories and Workhouses { over-time .	400	,,	,,
Barracks	600	,,	man.
Army Hospital Wards ..	1,200	,,	patient.
Standard for living rooms ..	1,000	,,	person.
Hospital Wards	2,000	,,	patient.

In buildings occupied for only a short period at a time—such as churches, schools, &c.—the air-space may be smaller than in buildings occupied for a longer period.

Mr. Tucker here concluded his remarks on ventilation and proceeded to deal with warming. Owing to the great pressure on our space we are obliged to hold over till next week our report of this section of the paper.

A. A. OF IRELAND.

THE ninth technical demonstration of the Architectural Association of Ireland was held, by permission of Dr. Traill, at the new Electrical Laboratory, Trinity College, Dublin, on March 12th, the demonstrator being Mr. Tatlow. There was a large attendance. After carefully describing the various electrical terms in common use, Mr. Tatlow dealt with the subject of wiring, stating that any wire exceeding No. 18 gauge should be stranded. Rubber insulation is the best form, but paper covered with lead is sometimes substituted, as it is less liable to attack from damp, in exposed positions. The casing and capping is usually of wood, but when the wires are bedded in walls they should be cased in steel tubing, either seamed or brazed, the latter method being more expensive, but giving better results in damp situations. In very wet places gun-barrel and white lead are necessary to fully protect the wires. Underground circuits are usually insulated with oil and paper laid in troughs filled with pitch. Having exhibited various samples of switches, the chief points of which should be a quick and long break, the demonstrator proceeded to deal with electric lamps and stated that low-efficiency lamps are preferable to the high efficiency. The principles of the new "Nernst" lamp were explained, and a sample compared with the ordinary incandescent light. With regard to plant, the gas engine gives as a rule a far better result than steam, unless the latter is used for other purposes. An oil engine should always have a good fly-wheel or intermittent brilliancy will result. The demonstration, which was fully illustrated by samples and experiments, concluded with a few remarks on accumulators, telephones and bells.

The last demonstration was held on March 19th at the premises of Messrs. J. F. Keatinge & Sons, Grafton Street, Dublin. Mr. Keatinge described the constituents of paint and the various finishings, samples of the latter being handed round for inspection. Having dealt with the composition of varnishes, pointing out no oil should be used in varnishing seats, the demonstrator described the differences between ordinary and patent distempers, and proceeded to exhibit various qualities of wallpaper. The manufacture of stained glass having been explained and samples inspected, the proceedings terminated.

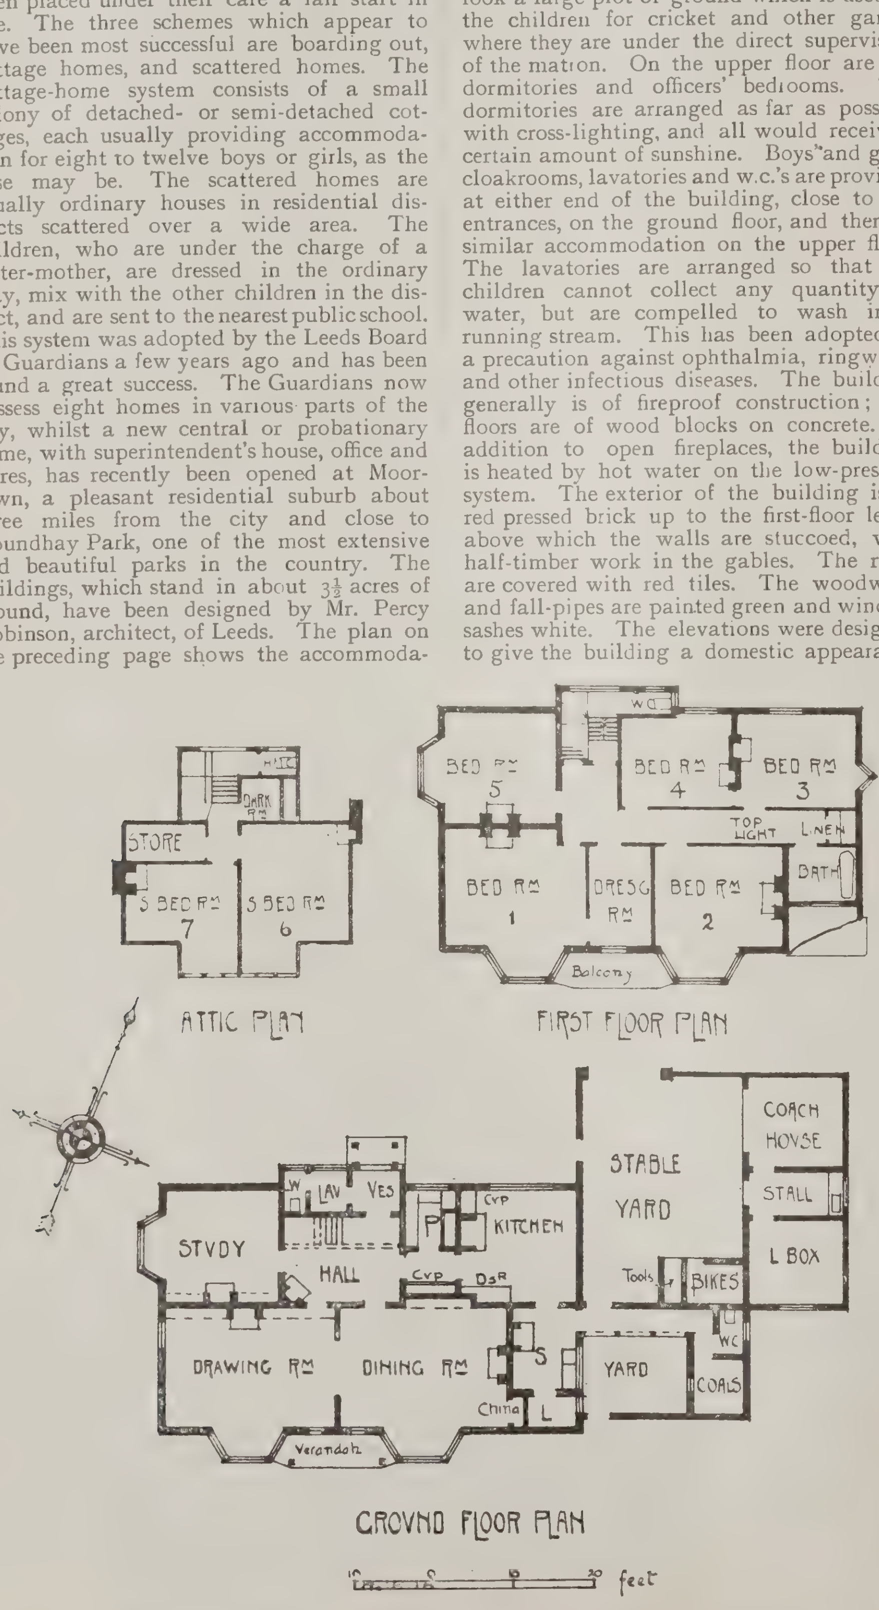
Bricks and Mortar.

Aphorism for the Week.

Through wisdom is an house builded, and by understanding it is established: and by knowledge shall the chambers be filled with all precious and pleasant riches.

PROVERBS XXIV. 3-4.

Our Plates. THE problem of dealing with pauper children has of late years been very prominent, and various schemes have been advocated and adopted by different "unions" with the object of removing the workhouse taint and giving children who by misfortune have been placed under their care a fair start in life. The three schemes which appear to have been most successful are boarding out, cottage homes, and scattered homes. The cottage-home system consists of a small colony of detached- or semi-detached cottages, each usually providing accommodation for eight to twelve boys or girls, as the case may be. The scattered homes are usually ordinary houses in residential districts scattered over a wide area. The children, who are under the charge of a foster-mother, are dressed in the ordinary way, mix with the other children in the district, and are sent to the nearest public school. This system was adopted by the Leeds Board of Guardians a few years ago and has been found a great success. The Guardians now possess eight homes in various parts of the city, whilst a new central or probationary home, with superintendent's house, office and stores, has recently been opened at Moortown, a pleasant residential suburb about three miles from the city and close to Roundhay Park, one of the most extensive and beautiful parks in the country. The buildings, which stand in about 3½ acres of ground, have been designed by Mr. Percy Robinson, architect, of Leeds. The plan on the preceding page shows the accommodation provided. This is really the headquarters of the whole system, whence stores, clothing, boots, &c., are issued by the superintendent to the various homes. A little further to the left is the main building, which provides accommodation for forty children. The sexes are kept separate, except at meal-times, when the common dining-room is used. Large day-rooms are provided at either end of the building for boys and girls, with covered playgrounds adjoining, to which children have direct access in wet weather. Between the boys' and girls' departments are the officers' rooms, a sewing-room for girls, and an emergency sick-room. A room is provided for the use of the committee, and also serves as a waiting-room. All the principal rooms face south and overlook a large plot of ground which is used by the children for cricket and other games, where they are under the direct supervision of the matron. On the upper floor are the dormitories and officers' bedrooms. The dormitories are arranged as far as possible with cross-lighting, and all would receive a certain amount of sunshine. Boys' and girls' cloakrooms, lavatories and w.c.'s are provided at either end of the building, close to the entrances, on the ground floor, and there is similar accommodation on the upper floor. The lavatories are arranged so that the children cannot collect any quantity of water, but are compelled to wash in a running stream. This has been adopted as a precaution against ophthalmia, ringworm and other infectious diseases. The building generally is of fireproof construction; the floors are of wood blocks on concrete. In addition to open fireplaces, the building is heated by hot water on the low-pressure system. The exterior of the building is of red pressed brick up to the first-floor level, above which the walls are stuccoed, with half-timber work in the gables. The roofs are covered with red tiles. The woodwork and fall-pipes are painted green and window sashes white. The elevations were designed to give the building a domestic appearance as far as possible harmonizing with the surroundings and avoiding any suggestion of the institution.—The house at Cabinteely, co. Dublin (Messrs. Clare and Ross, architects, Chelmsford) has just been completed for Mr. A. Marrable. The accommodation is shown by the plans on this page. The house commands magnificent views of the Wicklow Hills and the Irish Sea in the distance, and stands on about an acre and a quarter of land. Owing to the scarcity of bricks in the district and the expense of masonry the house is constructed of a framework of steel filled in with cement-concrete, the lower part being rendered in cement, the upper part in cement rough-cast, and the roof formed with plain Broseley tiles. The joinery throughout the interior is in pine of various colours left clean from the plane and varnished. The contract, including drainage, was £1,637. Mr. A. Fraser, of Bray, co. Wicklow, was the builder.—The north porch of Wells Cathedral agrees with the nave in everything except that there is an abundance of detached shafts (of Doulting stone). It dates from the early part of the thirteenth century, with later additions. Two plans are given on p. 92.



HOUSE AT CABINTEELY, CO. DUBLIN. CLARE AND ROSS, ARCHITECTS.

Contemporary Architecture. AT last week's meeting of the Glasgow Architectural Association Sir John Stirling Maxwell, M.P., delivered a lecture on "Contemporary Architecture from a Layman's Point of View." He said that if we were to rise to anything like a true estimate, we must begin by discounting the charms of age, and even look with just eyes on buildings which were old-fashioned, although not old. Apart from new needs and new materials, architecture moved but slowly. The nineteenth century was full of incentives, and they were more fully recognized in its buildings than one was apt to remember. It was never difficult to recognize a building of the past age nor the decade to which it belonged, and it would be just as easy for the student of the future to do so on account of the changes of planning as well as of materials. What merely spelt "old-fashioned" for us would to the critic in the next century mark an alteration of style. Perhaps the critis would say, "We will not dispute that your buildings are recognizable; we complain that you have drawn on the past for your style instead of inventing one of your own." That complaint, however, disregarded the fact that every age had drawn on those which had gone before. The limitations of human ingenuity made this inevitable. No style had ever been more than a development of something which had preceded it. The immense number of buildings which modern civilization required had made such an idea as the one expressed by critics undesirable as well as impossible. Our city would be dull indeed unless the new style advanced more quickly than styles had done in the past. Let no one suppose that there was anything new in searching for models from the past. Ancient Rome borrowed from Greece and the Renaissance from both. He had been at some pains to defend architects from the unjust charge of want of style, partly because it was made too commonly and partly because they were apparently taking it so much to heart. So long as a building was nothing more than an expression of the purpose for which it was intended, so long, in other words, as every detail was dictated by the needs of the case alone, the architect might disregard tradition and yet be sure of an admirable result. The moment, however, that he overstepped these limits and chose a moulding, the form of an arch, or, still more, when he added any ornament to his building, he found himself following tradition. New needs and new materials the architect would always welcome as affording new opportunities.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Infectious Diseases Hospitals.

R. H. B. writes: "Which is the most up-to-date handbook on what is necessary to observe in planning infectious diseases hospitals?"

"Cottage Hospitals," by Sir H. C. Burdett, 8s. 6d. (B. T. Batsford.)

Book on Bakehouses.

Doncaster.—E. H. M. writes: "Do you know of any publication on the construction of bakehouses?"

We do not know of any such book.

Stephenson's "Estimating."

London, E.—G. N. K. writes: "Referring to the reply to 'O. S.' (Stourbridge) on p. 55 of your issue for March 11th, I have seen a book by Stephenson entitled 'Repairs: How to Measure and Value Them.' This is probably what your correspondent requires."

Air-Space at Rear of Buildings.

Bakewell.—H. A. R. writes: "I propose to take down an old cottage, stable, cowhouse and privy which stand on a steep slope and erect two cottages in their place. From the accompanying plan (not reproduced) you will see that I propose to cut back the rock, leaving a 5ft. passage-way. The urban district council refuses to pass the plan, saying that it does not comply with their by-law 53 (with regard to open spaces). I contend that my boundary is the boundary of the site, averaging 27ft. from the cottages; but the Council contends that the rock cutting is the boundary and I must cut back 10ft. (in limestone rock), and that they can compel me to cut back 20ft. Who is right?"

The local sanitary authority appears to be acting strictly within their legal rights in declining to pass the plans under such conditions. Section 157 of the Public Health Act, 1875, provides for every urban authority making by-laws with respect to the sufficiency of space to secure a free circulation of air in and about domestic buildings. The local by-laws not only require that there shall be an open space of not less than 150 sq. ft. at the rear of the building, but that such open air-space shall extend *laterally* throughout the entire width of such building. The height of the proposed building being 25ft., the by-laws further require that such open space shall extend laterally to a distance of 20ft. It does not necessarily follow that because the boundary of your property is more than 20ft. from the proposed building such boundary is to be considered as providing the requisite *lateral* open space for that distance. For all practical purposes you propose erecting a building below the natural contour or level of the ground by constructing it in an excavation cut into the side of the hill, and thus creating a new ground level for the building, but neglecting to provide the essential open space at the rear of the building. T. E. C.

Birtley.—B. B. writes: "The local by-law 54 states that an open space of not less than 150ft. super. shall be left in the rear of a building and shall extend laterally 10ft., 15ft. or 20ft. from every part of such building to the boundary of any lands or premises opposite or adjoining. Is this taken to the outside or inside of my yard wall?"

The necessary width is to be measured from every part of the building to the boundary of any lands or premises immediately opposite. In this instance the boundary is the inner face of the yard wall, so that in measuring the width of open space required the dimensions should be taken only as far as the face of the wall. According to the wording of the clause, the thickness of the boundary wall cannot be included in the width of open space, for such open space must be free from any erection except a water-closet, earth-closet, privy or ash-pit. In the case of *Adams* v. *Bromley Local Board* it was decided that a small wooden fence 3ft. 6in. high was an erection within the meaning of the by-law, and so formed an encroachment on the air-space as required for the purposes of the by-laws made by the local sanitary authority under the powers conferred on them by the Public Health Act. T. E. C.

Sound-deadening Floors.

Crieff.—Constant Reader writes: "I have to deaden a large billiard-room floor the underside of which is covered with ¾in. lining, forming the ceiling of a lecture-room below. I cannot lift the floor as the room cannot be closed. If a layer of slag-wool 2in. or 3in. thick were laid on top of the lining, would this make the floor soundproof? We could manage to put in the wool by lifting a flooring board here and there. Or would you advise taking off the lining and putting on silicate slabs nailed to the underside of the joists and then re-lining on the underside?"

A layer of silicate cotton on the lining alone would not be sufficient. We advise you to replace the lining with silicate cotton slabs, with a 2in. layer of silicate cotton above.

Water in Cellars.

London, S.E.—G. N. K. writes: "A cellar became flooded with 6in. or 7in. of water. The floor, about 9ft. below ground-level, is of cement-concrete. I am told that the water mains are about 3ft. below ground, and that the cellar floor is at a lower level than the sewer. The water was pumped out, and inspection showed what appeared to be a spring rising through a joint in the footings. It has been intermittent in action. Can you suggest that it is anything but a spring; and what do you recommend to be done?"

Apparently the flooding of the cellar is of recent occurrence. Assuming that this is not caused by an adjacent defective water-main, service-pipe, or storm-water drain, it is probable that the water arises from a ground spring or percolation of water occasioned by the late excessive rainfall. The level of the ground water in the locality may have occasionally risen to an abnormal height from various causes, the increased pressure thus forcing the water through some weak joint in the foundations. During the past few weeks we have observed in some localities near the sea that the high spring tides, combined with the heavy rains, have temporarily raised the ground-water level much above the usual height in those districts. If the height and general arrangement of the cellar permit, probably the most economical and satisfactory remedy would consist of a bed of cement-concrete 6in. thick laid upon the existing floor, and finished with a floated face. The walls might also be rendered with cement to a height of 4ft. or 5ft. Should this not effect a cure, then line the floor and walls with asphalt. T. E. C.

Councillors as Clerks of Works.

Port Dinorwic.—E. J. writes: "The urban district council is constructing some waterworks for Port Dinorwic which will cost £2,400, and they have employed a member of the parish council to be clerk of works. (1) Have they the right to do so? (2) Who should employ the clerk of the works—the district council or the parish council?"

(1) Yes, as the works are apparently being executed for the urban district council, and the clerk of works appointed by them is not a member of that particular council, but of a neighbouring parish council in which locality it so happens that the necessary works in connection with the water-supply are situated. (2) According to the information given, the works are being carried out for the urban district council, and the clerk of works would be employed by them. T. E. C.

Concrete for Stable.

Chester.—W. S. writes: "It is intended to use the old bricks which formed a stable floor as hard core for a concrete floor which is afterwards to be rendered with cement and limestone chippings. Will the ammonia with which the bricks are more or less impregnated be detrimental either to the concrete or the cement above?"

The aggregate would not seriously affect the strength of the concrete, but will probably cause efflorescence. We advise you, if the bricks are used, to adopt a proportion of 5 of aggregate to 1 of good Portland cement.

QUANTITY SURVEYORS.

Proposed Association.

A MEETING of London and provincial quantity surveyors was held on March 6th at the offices of Mr. F. B. Hollis, 17, Bedford Row, London, W.C. (Mr. W. Hoffman Wood, of Leeds, in the chair), when it was resolved to seek the co-operation of gentlemen favouring the formation of an association solely for quantity surveyors, which it is proposed to call "The Quantity Surveyors' Association." It was resolved "that in the formation of the Association the value and importance of the Surveyors' Institution be fully respected and recognized, and that that body shall be courteously approached to assist in the registration of the Association, and that members of the Surveyors' Institution who are practising as quantity surveyors be invited to also join the distinctive Association"; it was further resolved that none but qualified quantity surveyors be admitted to membership.

The main objects of the proposed association are briefly as follows:—

1. To uphold the dignity and importance of the profession, and to provide the means for quantity surveyors to meet and discuss subjects of interest and to settle cases of difficulty.
2. As a guarantee of efficiency and fair dealing as between the building owner and the builder.
3. As an additional means of ensuring the confidence of architects.
4. To encourage uniformity of practice.

It was further resolved at the meeting that the founders' first annual subscription should be one guinea, which should cover entrance fees. After the registration of the Association it is suggested that the entrance fee shall be five guineas and the annual subscription two guineas.

A circular letter has been sent to all London and provincial quantity surveyors (so far as their names and addresses can be obtained from directories and from the secretaries of architectural associations), accompanied by a post-card on which it has been requested that opinions about the proposal should be expressed. The honorary secretary (Mr. Hollis) will be glad if any quantity surveyor who has been omitted will communicate with him at once.

A general meeting will be called at an early date to elect a president, officers, &c.

MODERN LONDON BUILDINGS.

Having received numerous enquiries on the subject, we thought it useful to have a list compiled of the principal buildings erected in London during the last twenty-five years. In compiling this list the Editors have met with much difficulty. The pages of this and other technical journals have been consulted and put largely under contribution, and our thanks are tendered to our contemporaries for the large amount of information which was thus obtained. Still, inaccuracies and omissions must be inevitable in such an undertaking, and we should be much obliged to any of our readers who would kindly write to us with corrections and additions. As far as it is possible to do so the buildings are dealt with in districts, and, as will be seen, are gathered together under the respective years when they were erected.

E.C. DISTRICT: PUBLIC AND SEMI-PUBLIC BUILDINGS.

Building.	Architect.	Approximate Cost.	Remarks.
1875.		£	
Bridewell Police Station, Fleet Street.	Horace Jones, City Architect.	—	
Liverpool Street Station, G.E.R. Railway.	Edward Wilson	—	The building covers 10 acres, and is 2,000ft. long and 90ft. high. The design is Gothic in character and is executed in white Suffolk brickwork with Bath-stone dressings.
1876.			
Old Bailey, Stables and Coach-Houses.	W. S. Witherington.	—	
1877.			
Grecian Theatre, City Road	J. T. Robinson	—	The theatre will accommodate 4,000 persons. It has a stage 60ft. deep. Now used as S A barracks.
1878.			
Carpenters' Hall, junction of London Wall and Throgmorton Avenue.	W. Wilmer Pocock	29,000	The building is in the Palladian style, and is erected of Portland stone. The Court-room measures 42ft. by 26ft. by 18ft. high. The luncheon-room is 28ft. by 24ft. by 18ft. high. There are the usual offices, &c., on the ground floor. The first floor contains a hall 76ft. by 38ft. by 36ft. high, and a drawing-room 42ft. by 30ft.
City Carlton Club, between St. Swithin's and Sherbourne Lanes.	R. Roberts	27,000	The building is of stone, and is capable of accommodating about 1,200 members.
City Liberal Club, Walbrook.	G. E. Grayson	32,000	The building, which has a frontage of 58ft. and a depth of 115ft., is erected in Portland stone, with mullions and columns of red Aberdeen granite. The carving was executed by Mr. T. Broomfield, and the foundations were carried down to a depth of 40ft.
The Temple Buildings, erected by the Inner and Middle Temple Benchers.	E. M. Barry and J. P. St. Aubyn (Joint Architects).	76,000	The building is erected of Portland stone, standing on a grey granite podium. The rooms are arranged in suites of barristers' chambers.
1879.			
Central Fruit and Vegetable Market, Smithfield.	Horace Jones, City Architect.	115,000	The market covers an area of 44,000ft. It comprises forty-one shops fronting on the four surrounding roads, and thirty-three shops inside the market.
Holborn Town Hall and District Board Offices.	H. L. Florence and L. H. Isaacs.	25,987	The site has a 100ft. frontage to Gray's Inn Road and 124ft. frontage to Clerkenwell Road. The public hall is 90ft long by 45ft. wide by 30ft. high, and will accommodate 1,200 persons. The board-room is 48ft. long by 30ft. wide, with committee-room, &c. The style adopted was Free Italian. There is a clock tower 100ft. high at the angle of the building, which is of red brick and Portland stone.
Infirm wards of Administrative Offices, St. Luke's Workhouse, Shepherdess Walk, City Road.	A. Saxon Snell	36,000	The wards generally are 80ft. long by 40ft. wide and 13ft. high; 800 cub. ft. of air-space are allowed to each patient, accommodation being provided for 930 inmates, besides administrative offices, &c. The cost is less than £38 per bed.
St. Bartholomew's Hospital (additions), Giltspur Street.	Edward I'Anson	—	The additions comprise a practical-classroom and museum. The elevation is in Portland stone and is Classic in style. The façade is 100ft. long and 75ft. high. The practical room is for 150 students.
Mercers' Company's Buildings, Poultry.	G. B. Williams	70,000	The buildings have a frontage to Poultry of 150ft., and are 70ft. to 80ft. in height and 80ft. deep. The ground-floor consists of large shops with Aberdeen granite piers, the upper parts of the elevation being of Portland stone. The Mercers' chapel is situated in the central portion of the building.
Merchant Taylors' Hall, Threadneedle Street and Cornhill (additions).	Edward I'Anson, Company's Architect.	23,000	The additions are Gothic in style and carried out in Portland and Spinkwell stones. The buildings are 50ft. high and the north block is 60ft. long. The court-room, measuring 37ft. by 24ft. by 20ft. high, is Elizabethan in character. A library, doctor's room, waiting-room, and domestic accommodation are also provided.
1880.			
Goldsmiths' Company's Buildings, Cheapside.	Ford & Hesketh	—	The frontage of the buildings is 80ft. in length and 70ft. high. The elevation is in Portland stone, the ornamentation being in polished granite, with a profusion of carving and sculpture.
1881.			
Inner Temple Library (additions.)	R. W. Edis	—	The building is faced externally with red bricks, the roof being surmounted by a flèche. The style is late Gothic, and the carving was executed by Mr. G. J. Frampton. There are two spacious apartments.
1882.			
Children's Hospital, Mark Street, Finsbury.	J. D. Sedding	—	
Bakers' Hall, Harp Lane, Great Tower Street.	Clarke & Shoppee	12,000	The new buildings have a frontage of 92ft. to Harp Lane and a height of 52ft. to ridge. The ground-floor elevation is of Portland stone, red brickwork being employed above. The interior is faced with white-glazed bricks.
1883.			
Curriers' Hall and adjoining Warehouses, Wood Street, London Wall.	John Belcher	—	The frontage is in red Mansfield stone.
Central Fish Market for London, Farringdon Road.	City Architect	430,000	The market has an area of 44,000ft., and consists of thirteen shops.
Council-Chamber of the Guildhall.	Horace Jones, City Architect.	33,249	The council-chamber is a duo-decagon in shape, having an internal diameter of 54ft. and a height of 61ft. 6in.
Leadenhall Market (rebuilding).	Edmeston	70,000	The angular frontage at the corner of Gracechurch Street is 70ft. in height and is of Portland stone. The Leadenhall Street frontage, 250ft. long, has shops on the ground floor, with offices over.
1884.			
Butchers' Hall, Bartholomew Close.	Alexander Peebles	—	
Hospital for Diseases of the Chest, City Road (new buildings).	J. O. Abbott	14,000	The buildings are 74ft. wide and 84ft. high, having a ground floor and three storeys above. The tower at the corner is of stock brickwork and is 114ft. high. The ground, first and second floors each contain three wards 31ft. by 18ft.
1887.			
Innholders' Hall, Little College Street.	J. Douglass Mathews	—	Parts of the old hall designed by Wren are preserved in the new buildings.
City of London Court of Law, Guildhall Buildings, 84, Basinghall Street.	Andrew Murray	13,637	The ground floor contains offices for clerks and bailiffs. The Judges' Court measures 45ft. by 26ft., and the Registrar's Court 36ft. by 26ft. The general entrance is in the centre of the façade to Guildhall Buildings. The style employed was Late Gothic, the walling being of Kentish rag, with moulded work in Portland stone. The hall and staircase are in Bath stone, the open-timbered roof being in oak.
1890.			
General Post-Office, St. Martin's-le-Grand.	Henry Tanner, H.M.O.W.	—	Area of floor space, 152,820 sq. ft. The buildings generally are faced with Portland stone, but in the courtyard glazed brick is freely used. All floors are of concrete with steel joists, and the roofs are asphalted flats.
1892.			
Home for Working Boys, Spital Square, E.C.	W. H. Seth-Smith	6,000	The premises accommodate eighty boys. The upper part of the building is arranged in dormitories. In the lower part of the house are a dining-room, a meeting- and reading-room and a gymnasium, as well as a kitchen, bathroom, lavatory, &c.

Buildings.	Architect.	Approximate Cost.	Remarks.
1892 *—cont.*		£	
Premises of the Marine Society, 54 to 57, Bishopsgate Street, Within, E.C.	J. H. Smith - -	21,000	The buildings cover an area of 7,000ft. super. and consist of seven floors, including the basement. The ground-floor front is in red and grey granite, and the whole of the upper part of the front is of Portland stone. The carving is by Mr. Gilbert Seale.
Fruit & Vegetable Market, Charterhouse Street and Farringdon Road.	Alexander Peebles.	70,000	The buildings occupy an area of 30,000 ft. super, having frontages of 370ft. and 184ft
1893.			
Drill Hall of the London Rifle Brigade, Bunhill Row, E.C.	H. C. Boyes, F.R.I.B.A.	—	The hall is 180ft. long by 60ft. wide.
Record Office, Chancery Lane, E.C.	John Taylor, H.M.O.W.	To cost £160,000. Present buildings, £80,000.	
The Institute of Chartered Accountants, Moorgate Street, E.C.	John Belcher -	—	The building is executed in Portland stone. It contains a council-chamber and committee-room and general offices on the first floor. On the second floor is the examination hall, capable of containing 100 students. The library and reading-room on the ground floor is a lofty apartment with galleries and bookcases, and a panelled ceiling supported by stone columns. The grand staircase, halls and corridors are vaulted. The frieze which runs along the whole of the building under the second-floor windows was carved by Mr. Hamo Thornycroft, R.A., and the caryatides above the ground floor and other figures by Mr. Harry Bates, A.R.A. The subsidiary carving is by Messrs. Farmer & Brindley.
1894.			
The Bishopsgate Institute, Bishopsgate Street Without.	C. Harrison Townsend.	—	The principal features of the Institute are the library and the meeting-hall. The reading-room on the first floor accommodates about 200 readers, one portion of this room being arranged for women readers. The walls of the corridors and staircases are lined with tiles and the floors with marble mosaic. The floors of the library and hall are laid with wood blocks, and are of fireproof construction. The hall, 80ft. long by 40ft. wide, seats 520 persons. The principal elevation is carried out in light yellow terra-cotta. The two less important fronts are of red brick, with terra-cotta dressings.
Cripplegate Institute, Golden Lane.	Sidney R. J. Smith	20,000	The building contains a library, technical classrooms and a concert hall for 500 persons.
Offices for the Conservators of the River Thames, Victoria Embankment.	Hunt & Steward -	15,000	The ground floor is occupied by the accountant's and solicitor's departments. The first floor is taken up by the board-, chairman's- and committee-rooms, the board-room being about 20ft. high. The secretary's department is on the mezzanine floor and the engineer's on the second floor, while additional rooms are provided on the third floor and strong rooms in the basement. The building is next to Sion College, with which it harmonizes.
1895.			
Commissioners of Sewers' Offices, Basinghall Street.	Colonel Hayward-	—	The building has a total floor accommodation of 20,750ft. and the construction is fireproof throughout.
Turkish Bath, Broad Street House, New Broad Street, E.C.	G. H. Elphick -	—	The style adopted was Moresque, the saloon being decorated in an Alhambra fashion. Faïence is largely used for decorative purposes, and the baths are luxuriously appointed throughout.
1896.			
Offices of the Jewish Board of Guardians, Widegate Street, E.C.	Davis & Emanuel	—	The building comprises a block of offices four storeys in height. The front is of red brick relieved with stone and red concrete strings. The construction is fireproof throughout. On the ground floor are, on the right hand, clerks' offices, waiting-rooms and secretary's room, and on the left hand the committee-rooms and the waiting-rooms of the relief department. On the first floor are several committee-rooms and a board-room measuring 32ft. by 26ft. On the second floor is a large double-room forming girls' workroom, a dining-room for the girls and a room for the superintendent. On the top floor are the adult sewing classroom, the rooms for the clothing department and the caretaker's apartment. The basement contains the industrial department, including a master's room, clerk's office and waiting-rooms, also the loan department.
Fire Station, John Carpenter Street, Blackfriars.	Thomas Blashill (late Superintending Architect, L.C.C.).	21,000	The building is eight storeys in height, while the top of the look-out tower is 120ft. above the pavement. Accommodation is provided for two steamers, four horses and sixty men with their families.
1898.			
Moorgate Street Station (new superstructure).	Delissa Joseph -	18,000	The elevation is executed in Portland stone and occupies a frontage of about 155ft. to Moorfields and 90ft. to Fore Street Avenue.
Head Offices of the Metropolitan Asylums Board, Victoria Embankment.	Edwin T. Hall -	49,543	The building has a frontage to the river of 93ft. and to Carmelite Street a frontage of 127ft. The principal entrance is at the front angle, while there is a secondary entrance to the north-east staircase, giving access to the public gallery of the board-room. The building is of fire-resisting material throughout, including the roofs Externally it is of Portland stone and red bricks. The domes are of copper and the roofs of Westmoreland green slates. The board-room, which is on the first floor, accommodates 100 members, and has a reporter's gallery at one end and a public gallery at the other.
1899.			
Royal London Ophthalmic Hospital, City Road.	Keith D. Young and Henry Hall.	80,000	The hospital stands on a site 35,000ft. in area, having frontages to City Road, Cayton Street and Peerless Street. It contains 140 beds and 105 rooms, excluding the basement. The building is designed in a somewhat French type of Renaissance, and is faced with Portland stone, with a porch occupying the centre of the front. The construction of the building is fireproof, the floors being formed of iron girders protected by terra-cotta tubes and covered with coke-breeze concrete, and all the partition walls are either of brick or hollow terra-cotta tiles, filled with concrete. The corridor floors are finished either with terrazzo or with artificial stone, and the staircases are made of cast concrete with iron joists embedded therein, while the ward floors are laid with teak boards.
Bank Station, for the City and South London Railway Company, Lombard Street, E.C.	Sidney R. J. Smith	—	The building is of Portland stone with a granite base. The booking-halls and waiting-rooms are under the adjoining church and the road. The large shaft measures 73ft. 6in. by 24ft., and in it are placed the electric lifts.
1900.			
Shelter, Golden Lane, E.C.	D. J. Ross, City Engineer.	—	This shelter was erected at the City Mortuary, Golden Lane, for the use of persons during the disinfection of their homes after illness. The building is of brick, with stone dressings to doors and windows, and the floors are of concrete.
1901.			
Fire-Brigade Station, Redcross Street.	W. E. Riley, Architect to L.C.C.	—	The site has an area of about 4,660ft. super. and a frontage of 90ft. The station is built to first-floor level of Portland stone, with granite plinth, and above first floor of red bricks. The engine-room is 33ft. by 47ft. and is lined with glazed bricks. The stabling is to the rear of engine-room. The watch-room has an area of 180ft. and the recreation-room an area of about 400ft. super. The upper floors contain accommodation for officers and men.

THE SANDWICH BARBICAN.

CANON H. D. RAWNSLEY, honorary secretary of the National Trust, writing to the "Times," says: "Lovers of that little old Cinque Port town with its crooked streets, its overhanging house fronts, its Dutch chimneys, its curfew bell, and its two surviving city gates, will be much relieved to hear that the mayor and councillors have decided not to demolish and rebuild on a new plan, for their office needs, the ancient Barbican, but have, in consideration of the uniqueness of this picturesque fragment of old time, determined to do all in their power to conserve it, as far as possible, *in statu quo.* To this end they have called in the aid of the lately appointed diocesan architect, Mr. Jennings, of Canterbury, and have determined to renew the roof timbers and to replace the roofing tile for tile, to renew the worn-out weather boarding with weather boarding of the same material and pattern, to hack off about 2ft. of disfiguring cement and show the stonework of the base of the flanking tower of the gate, and to remove a comparatively modern small lean-to building outside the gate, which will do two things—allow the public sight of the until now hidden town wall, and add much effectiveness to the height and round of the tower. It appears—and I speak after careful inspection of the woodwork, stripped of its tiling—that had the town authorities not taken the matter in hand the roofing of gate and tower might have fallen any day and, for lack of plans and drawings to scale, have been irreparable. As it is, the Barbican will be the Barbican unchanged in general appearance for centuries to come."

Keystones.

St. Bartholomew's Hospital is to be reconstructed gradually.

The new Holborn-to-Strand Subway, which will be constructed simultaneously with the new roadway, is estimated to cost £279,000.

Little Bytham Church, Grantham, has recently been warmed by Messrs. John King, Ltd., engineers, of Liverpool, employing their latest improved hot-water heating apparatus.

Partnership. — Mr. Rowland Plumbe, F.R.I.B.A., of 13, Fitzroy Square, London, W., has taken into partnership Mr. Frank M. Harvey, A.R.I.B.A., who has been associated with him for a period of over twenty-one years. The practice will be continued under the style of Rowland Plumbe & Harvey.

Change of Address.—Mr. Henry James Wise, A.R.I.B.A., has removed his London address to 7, Great James Street, Bedford Row, W.C. Mr. Wise was for four years chief assistant in the offices of the Duke of Marlborough's architects, and he was engaged on the plans of His Grace's new town house in Mayfair.

The Church at Peel, erected in 1884 at a cost of £12,000, having been wrecked by the recent gale, £2,000 will be needed to repair it. The roof of the nave and north aisle was stripped off, and the slates, timber and part of the clearstory walls fell in on the seats, while a large stained-glass window at the west of the nave, which cost £500, was blown out and smashed to atoms.

The Subjects of the R.I.B.A. Competitions for 1903, of which a pamphlet has just been published (price 3d.), are as follows:—*Essay Medal,* for the best essay on "The delineation of architecture"; the *Soane Medallion,* "Design for a University theatre"; the *Tite Prize,* "Design according to the principles of Palladio, Vignola, Wren or Chambers for a Crescent in a Large City"; *the Grissell Prize,* "Design for a timber spire or lantern termination." The subjects of the other competitions are as formerly.

A new Workhouse Infirmary at Willesden has been erected in Acton Lane from plans by Mr. A. Saxon Snell, F.R.I.B.A. Messrs. Godson & Sons, of Kilburn, were the builders, and the foundations were put in by Messrs. Cowley & Drake, of Willesden Green. The installation of electric light and power was designed and supervised by Mr. Morgan Williams, M.Inst.C.E., and carried out by Messrs. Crompton & Co., of Chelmsford. The general engineering work, and also the kitchen fittings, were carried out by Messrs. Rosser & Russell, of Hammersmith, and the laundry and washhouse by Messrs. Summerscales, of Halifax.

The Congress of the Sanitary Institute to be held at Bradford from July 7th to 11th next will be presided over by the Right Hon. the Earl of Stamford. Section I. (Sanitary Science and Preventive Medicine) will be presided over by Professor Clifford Allbutt, M.A., M.D., F.R.C P., D.Sc, F.R.S., J.P., D.L. Section II. (Engineering and Architecture) will be presided over by Maurice Fitzmaurice, C.M.G., M.I.C.E. Section III. (Physics, Chemistry and Biology) will be presided over by Professor C. Hunter Stewart, D.Sc., M.B., C.M., F.R.S E. The lecture to the Congress will be given by J. Slater, B.A., F.R.I B.A. Eight technical conferences will also be held in connection with the Congress, presided over by Councillor W. C. Lupton, Prof. Thomas Oliver, M.A., M.D., F.R.C.P., J. Spottiswoode Cameron, M.D., B.Sc., T. H. Yabbicom, M.I.C.E., D. Drabble, M.R.C.V.S., Mrs. Moser, James Kerr, M.A., M.D., D.P.H., and Mr. Isaac Young.

At Deptford Cattle Markets new chill-rooms have been erected at a cost of £30,000.

The Annual Dinner of the Society of Architects, to be held at the Prince's Restaurant, Piccadilly, has been postponed from April 24th to Friday, May 15th.

The Nottingham Industrial Exhibition opens in May next. The various buildings are now being erected, and the extensive grounds which adjoin Trent Bridge laid out. The industrial and machinery halls are designed in the Oriental style. Application for space should be made to Mr. Charles I. Kiralfy, 19, Buckingham Street, Strand, London, W.C., where the plans of the exhibition can be inspected.

Kettering Library Competition.—Mr. J. A. Gotch, the assessor in the Kettering Free Library Competition, has awarded the first premium to the set of drawings numbered 37, submitted by Messrs. Goddard & Co., of Leicester; the second premium to No. 14, by Messrs. Sutton & Gregory, of Nottingham; and the third to No. 53, by Messrs. H. Tateham-Sudbury and P. D. Pryor, of Ilkeston. The cost of the building was limited to £6,500.

The Architectural Vigilance Society.—Mr. H. Heathcote Statham, hon. secretary of the Society, writes: "I am requested, on behalf of the above-named Society (the title of which has been altered from 'The London Architectural Vigilance Committee' to that of 'The Architectural Vigilance Society'), to notify that the Society is now formally constituted, and held its first meeting on Tuesday, March 17th, at the rooms of the Royal Institute of British Architects under the presidency of the chairman, Lord Windsor. The first meeting was necessarily almost entirely occupied with formal business; but we are now in a position to receive and deal with any communications which may be addressed to us on the subjects in which the Society is interested."

The Liverpool Architectural Society held a meeting last Monday week, Mr. Thicknesse presiding. Mr. Laurence Hobson, A.R.I.B.A., read a paper on the "Ancient Churches of Wirral." He said one of the characteristics of the Wirral churches was their massive square towers. The quaintest church in this particular district was that dedicated to the Holy Cross at Woodchurch, the site of which probably once contained a wooden edifice; the most picturesque in its situation was the Shotwick Church; while from an architectural point of view St. Andrew's, Lower Bebington, was imbued with the greatest interest. At West Kirby it was likely that the church existed in Saxon times, while the Neston Church tower probably belonged to the early part of the fifteenth century.

The Fire Exhibition: Recent Designs of Fire Stations.—The committee of the loan section of the impending international fire exhibition are particularly desirous of being able to present recent designs of fire stations that are of an instructive and up-to-date character and of some architectural pretensions. Architects who have designed and executed fire stations since 1885 are therefore requested to put themselves in communication with Mr. F. R. Farrow, F.R.I.B.A., joint hon. secretary of the section, 29, New Bridge Street, London, E.C., giving particulars and designs that could be exhibited, preferably accompanied by some print or photograph. The committee are desirous of hanging well-drawn elevations, perspectives or large photographs with ground-floor and first-floor plans. The drawings or photographs must be framed, but there is no limitation as to character of frames or margins. The drawings would have to be sent in by the middle of April, and will be hung until the close of the exhibition towards the end of September.

Mr. R. S. Lorimer, architect, of Edinburgh, has been elected an Associate of the Royal Scottish Academy.

The Bishopsgate Street Widening.—The Improvement and Finance Committee of the Public Health Department, at the Guildhall, has been instructed to confer with the London County Council on the subject of the scheme for widening Bishopsgate Street Without, between Angel Alley and the city's boundary to a uniform width of 70ft. The scheme is estimated to involve an outlay of £334,000.

The Glasgow Technical College Architectural Craftsmen's Society held a meeting at 204, George Street, on Friday, March 20th, Mr. C. Ernest Monro in the **chair.**—A paper was read by Mr. James McKim on the Glasgow mode of measurement. The author gave a sketch of the origin and method of application of the modes generally. He then treated the different modes individually, singling out and explaining many points of general interest. An animated discussion followed.

Obituary.

The late Mr. F. C. Penrose left an estate which has been sworn at £25,584, including nett personalty £3,101.

Mr. Robert Archer, builder, of Douglas, I.M., died last week at the age of eighty years.

Mr. James Randle, who carried on the business of builder, contractor and quarry-owner with Mr. G. E. Sayce, under the style of Sayce & Randle, at Widnes, Lancashire, died recently.

Mr. Christopher Eales, architect and surveyor, of 9, Welbeck Street, London, W., and Worthing, Sussex, died recently at the age of ninety-four years. Deceased was partner with his son, Mr. F. E. Eales, F.R.I.B.A., in the firm of Christopher Eales & Son.

Mr. Charles Godfrey Leland, better known as "Hans Breitmann," who in addition to his other literary efforts was well-known for his writings on art subjects, died at Florence last Friday. He was born in Philadelphia, Pa., in 1824.

Mr. William Taylor, builder, of Paisley, died last Sunday week at the age of sixty-two years. The masonwork of several of the principal new buildings of the town was carried out by him, and his latest work included a number of the new buildings in connection with the Causeyside improvements.

Mr. William Hubbard, builder and contractor, of East Dereham, whose death is announced, was largely identified with church restoration; during the first thirty years of his career he was engaged in the erection or restoration of about fifty churches. In addition he had an extensive general business. Mr. Hubbard was in his seventy-ninth year.

Mr. T. W. Middlemiss, builder, of Morpeth, died recently at the age of sixty-four years. He was born at Mitford, and was the fourth son of the late Mr. Thomas Middlemiss, builder, of Morpeth. Deceased was trained to his trade, and about 1870 succeeded to his business. By him it was greatly extended, and up till the time his health began to fail he was recognized as at the head of the building trade at Morpeth. While still a young man he was appointed borough surveyor to the Corporation of Morpeth, and about the same time was elected surveyor to the Morpeth Local Board of Health. In these capacities he did much useful work in connection with the property of the Corporation and the improvement of streets and footwalks in the town, as well as in connection with its water-supply. His increasing business and failing health led him to resign both of these appointments some years ago. The business itself was continued by those who acted under him.

Law Cases.

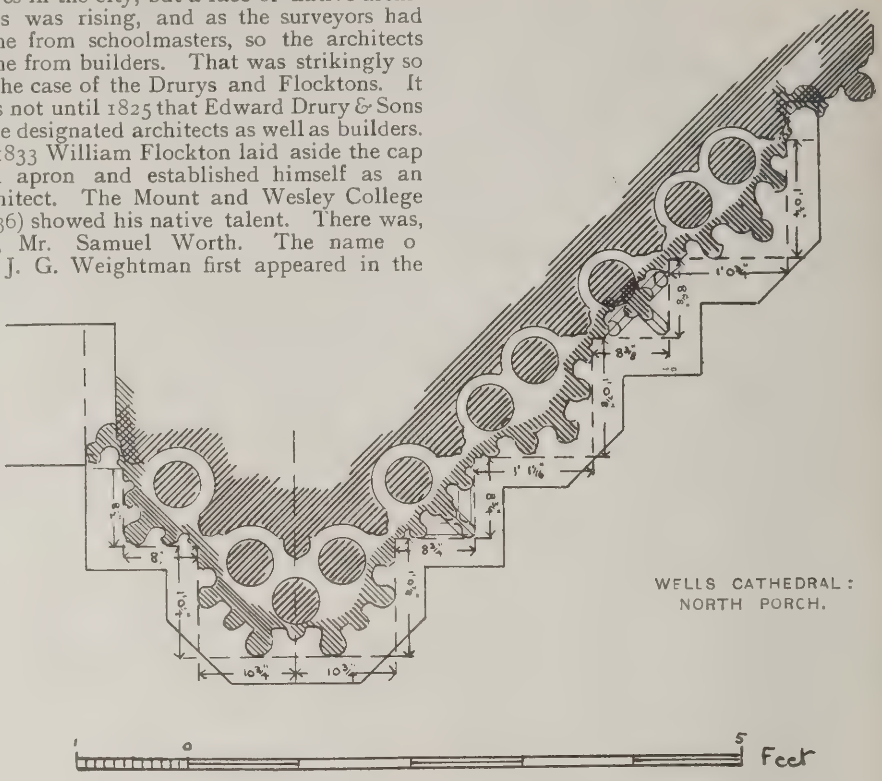
Drainage By-laws: Important Case in London.—At the Southwark Police Court on Wednesday last Mr. Cecil Chapman gave his decision in the thirty-three summonses taken out by the Southwark Borough Council against the Metropolitan Industrial Dwellings Co., the owners of the Ponsonby Buildings. These buildings were erected before the confirmation of the drainage by-laws of 1901, made under section 202 of the Metropolis Management Act, 1855; and in December, 1902, owing to the substitution of an iron pipe or drain for one of ordinary Doulton ware, the owners found it necessary to put new traps and pans connected with thirty-three water-closets in their buildings. They were then informed by the local authority that these new traps must be fitted with anti-syphonage pipes, in accordance with by-law 17 of the London County Council drainage by-laws, because the by-laws were made applicable to new work in old buildings as far as practicable. The defendants refused to comply, on the ground that these by-laws were not applicable and were unreasonable; and it was now further contended that they were *ultra vires*. The local authority thereupon took out thirty-three summonses for non-compliance in the case of each of the thirty-three closets, in order that these questions might be settled in a court of law. There did not appear to be any material dispute as to facts; but the defendants, in order to support their contention as to the unreasonableness of the by-laws, called evidence that the soil pipes were of such dimension, namely, of 5in. diameter, that the evils of syphonage, to prevent which these by-laws had been made, could not possibly occur, and that the expense which must be entailed by non-compliance with the by-law was so great as to make the application impracticable. Mr. Dodd, for the local authority, had contended that he had no right to consider any questions except the application of the by-law and its practicability. He (Mr. Chapman) had come to the conclusion that this contention was right. The by-laws admitted of no exception for the case of new buildings which contained a system of drainage where there was no probability of syphonage, and he did not think he was at liberty to create such an exception in the case of old buildings, to which the by-laws applied. If this were possible a dispute might be raised on each case, and the by-laws rendered practically valueless. He set aside, therefore, the question of whether the by-law was necessary or even useful in this particular case. Then, as to its practicability, he did not think there was any evidence that compliance with the by-law was not practicable. The figures given for the probable expenses went far beyond this case, and he did not consider they ought to affect his judgment. The words "so far as practicable," in his opinion, were intended for cases where large structural alterations or demolition of buildings would be necessitated by the application of the by-law, which was not the case here. He thought, therefore, that the application was practicable. He also considered that the work done involved the application of the by-laws to these traps. Mr. Danckwerts, K.C., contended that the work must involve a reconstruction of the rooms in which the water-closets were placed or, at any rate, of the system of water-closets; but he thought the words used in by-law 21 were intentionally wider than that, and specifically applied to every trap or apparatus connected with a pipe or drain. Two other questions remained: Were these by-laws under section 202 *ultra vires*, and were they unreasonable? On the first he was distinctly of opinion that they were not *ultra vires*. As to the second question, if he felt justified in pronouncing an opinion as to the reasonableness of the by-law as applied to this building, he should have great hesitation in deciding the case. He did not, however, feel so justified; but generally he could not doubt that it had been made by the London County Council and approved by the Local Government Board for good cause. In these circumstances, he could not hold that they were unreasonable, though he regretted there was no proviso for the case where it was proved that there was practically no danger of syphonage. There were other dangers, no doubt, connected with pipes of too large a diameter, and it might be that the authorities felt that the only safe way of dealing with so difficult and dangerous a matter was by such a hard-and-fast rule, and so long as it existed the local authority was bound to enforce it. He had no alternative but to convict the defendants; and there would be a fine of 40s. and £10 10s. costs on the first summons and 2s. costs on each of the others. In reply to an application on behalf of the defendants Mr. Cecil Chapman agreed to state a case.

Agreements under Seal with Local Authorities: Important Appeal Case.—The case of *Lawford* v. *Billericay Rural District Council* was recently heard in the Court of Appeal. The plaintiff sought to recover from the defendant district council remuneration for his services, as an engineer, in preparing a report and plans and performing other duties in connection with a sewerage scheme which was being carried out by the defendants. The defence was that the agreement on which the plaintiff relied was not a valid agreement binding on the defendants, because the common seal of the defendants was not affixed thereto. It appeared that in September, 1900, the attention of the defendants was called to the fact that the drainage of a portion of their district, called Shenfield Common, which was not within the scope of their original sewerage scheme, was in an unsatisfactory condition. The defendants, or a committee appointed by them under section 56 of the Local Government Act, 1894, thereupon passed a resolution that the plaintiff should be requested to visit Shenfield Common and make a report of what work was necessary to be done there and provide an estimate of the probable cost. The plaintiff visited the district, made a survey, and prepared and sent in a report and estimate. He was verbally instructed by the committee to act as engineer in respect of the extension work, and to render similar services to those rendered under an agreement of July, 1899 (under the seal of the council), by which he was retained as engineer, and this was confirmed by the defendants. It was admitted by the defendants that the plaintiff had full instructions for all the work he did, and that that work was incidental to the duties of the defendants as a district council, and that his services were in respect of work as to which some sewerage works were necessary. Mr. Justice Darling was of opinion that the agreement, not being under the common seal of the defendants, was not binding upon the defendants, and he accordingly gave judgment in their favour. The plaintiff appealed. --The Court allowed the appeal.—Lord Justice Vaughan Williams said the choice in this case really lay between the line of decisions of which *Clarke* v. *Cuckfield Union* (21 L.J., Q.B., 349) was one of the principal cases, or the cases inconsistent with that line of decisions. In *Nicholson* v. *Bradfield Union* (L.R., 1 Q.B., 620) these cases were dealt with at considerable length. According to the view which he took of the case, section 56 of the Local Government Act, 1894, did not enable the council to authorize the committee to do any act which was covered by the exception clause at the end of the proviso; for instance, the council could not authorize the committee to make any contract. Moreover, in the present case, in his opinion, the committee did not purport to make any contract on behalf of the council. Therefore for both of these reasons they must deal with the matter as if the contract alleged had been entered into by the council and not by the committee. In his opinion the decisions in *Clarke* v. *Cuckfield Union* and the other cases which had been decided on the same lines were to be preferred to the contrary decisions. The consideration in the present case was clearly executed; the defendants had accepted and availed themselves of the plaintiff's services and of his work. That being so, there was an implied contract to pay for them. The appeal must, therefore, be allowed, and judgment must be entered for the plaintiff.—Lord Justice Stirling and Lord Justice Mathew delivered judgment to the same effect.

Coronation Stands: Claim by an Architect.—At the Southwark County Court on March 16th the hearing was concluded of a remitted action in which Mr. H. D. Earl, an architect of Edgbaston, Tower Road, Worthing, sued Messrs. Pattenden & Co., of London, S.E., to recover 50 guineas, balance of a sum of 200 guineas, fees for work done as architect for the defendants under a contract for the erection of a stand in the churchyard of St. Clement Dane's Church, Strand, for the Coronation procession. The defendants counterclaimed the sum of £657 10s., being £157 10s. fees paid for plans which it was alleged were wholly useless, and £500 for loss sustained through the plaintiff's alleged negligence.—The plaintiff's case was that the plans were seen by Mr. Pattenden and his builder and accepted, and a contract was entered into to pay him 200 guineas for his services as architect and 5 per cent. on the nett profits of the letting of the seats. The plans were approved by the Westminster Corporation, and work commenced. The builder, however, made alterations, with the result that the rake of the tiers was considerably varied, and the number of seats was lessened, while another 200 seats were done away with by Mr. Pattenden insisting on the provision of intersecting gangways, which were unnecessary. Defendant contended that when the stand had been erected he discovered a large number of seats did not command a view of the centre of the roadway, while rows had been left out. The builder could not have deviated from the plans if the plaintiff had looked after the job properly.—Thomas Elkington, the builder, and his foreman declared that all the alterations made were carried out after consultation with the plaintiff, and with his consent.—One witness declared that when he remarked about not being able to see the road from certain seats the plaintiff said he had made a mistake in his plans and was worried to death, while he had not had any sleep for a fortnight through it.—After two days' hearing his Honour said he was convinced that Mr. Earl was a very competent architect and thoroughly understood his business, but by some unfortunate mistake his plans were such that when the stand was erected, even after alterations approved by him, there were many seats which did not command a view of the roadway along which the procession would have passed. That was a most serious defect in the plans, and in view of that he considered the amount which the plaintiff had received was sufficient. As to the counterclaim, he would strike that out and not go into the reasons for doing so. He therefore gave judgment for the defendants on the claim, with costs, and with the consent of the defendants struck out the counterclaim. Judgment accordingly.

OLD SURVEYORS AND ARCHITECTS OF SHEFFIELD.

At the last meeting of the Sheffield Society of Architects and Surveyors (Mr. T. Winder in the chair) a paper on old Sheffield surveyors and architects was read by Mr. R. E. Leader, B.A. He said that Robert Wilson (1704-1733) might be regarded as the father of Sheffield surveyors: and at that time the local surveying was the natural application of the mathematical knowledge of the schoolmasters of the period, as a long line of schoolmaster-surveyors showed, including Ralph Gosling, to whom abiding gratitude was due for his plan of Sheffield in 1736. Mr. Leader then proceeded to mention a number of the surveyors who followed, making special reference to the Fairbanks and the Fowlers. Turning to local architects, he said there were practically none until about sixty or seventy years ago. Taking a survey of their older public buildings one was struck by the regularity with which whenever anything more important than dwelling-houses within the scope of intelligent masons was required, architects were imported from other places. When St. Paul's Church was built in 1719 Mr. Platts (who erected Wortley Hall) was called in: when the parish church had to be repaired in 1777 Mr. Thomas Atkinson was brought from York. To Mr. Charles Watson, of Wakefield, was entrusted the Waingate Town Hall, 1805, and the infirmary (1793) was designed by Mr. John Rowstone, of Birmingham. Woodhead & Hunt, of Doncaster, were the architects for St. George's Church in 1821, and the Surrey Street Masonic Hall (1823) and Grammar School in Charlotte Street in 1825. Carver Street Chapel (1804) was the work of a circuit minister who had been intended for an architect, and so on. Some of these outsiders did establish themselves in the city, but a race of native architects was rising, and as the surveyors had come from schoolmasters, so the architects came from builders. That was strikingly so in the case of the Drurys and Flocktons. It was not until 1825 that Edward Drury & Sons were designated architects as well as builders. In 1833 William Flockton laid aside the cap and apron and established himself as an architect. The Mount and Wesley College (1836) showed his native talent. There was, too, Mr. Samuel Worth. The name o Mr. J. G. Weightman first appeared in the directory for 1833, and in 1837 Mr. M. E. Hadfield was at the Corn Exchange. The elevating influence they exercised on the architectural renaissance of the town was reinforced in 1845, when the late Mr. Thomas James Flockton brought to his father's office a fresh knowledge obtained from a larger sphere than the city. With the firms of Weightman & Hadfield and William Flockton & Son opened a new era in the architectural development of the city, and their influence was unmistakably stamped on its streets: an advance shown by a comparison of St. John's, Park, with St. Marie's, Norfolk Row, or Holy Trinity, Wicker, with St. John's, Ranmoor.



WELLS CATHEDRAL: NORTH PORCH.

Builders' Notes.

Partnership Dissolved.—The partnership subsisting between Mr. J. Ord and Mr. J. H. Brettell, of Portman Street, Marylebone, builders, decorators and sanitary engineers, has been dissolved.

Colney Hatch Asylum.—In addition to the means of escape from fire already provided at the Colney Hatch Asylum, three new "fire-escape staircases" are now being erected there by the St. Pancras Ironwork Company.

Messrs. T. & R. Boote, Ltd., encaustic and glazed tile manufacturers, of Birkbeck Bank Chambers, Holborn, London, W.C., are opening a store at the Midland Railway Co's goods depot, King's Road, St. Pancras, N.W.

The Newcastle and Gateshead Joiners have decided to reject the proposal for a settlement of the dispute with the employers, which was to submit either to an immediate reduction of 6d. and another 6d. in three months' time, or to an immediate reduction of 1s. and have winter hours for men engaged in exposed work in shipyards on the Tyne.

Labour in February.—The Labour Department of the Board of Trade report that the state of employment in February was slightly better than in January, but continues rather worse than a year ago. The total number of workpeople involved in disputes which began or were in progress during February, 1903, was 13,186. The changes in rates of wages reported during February affected about 146,300 workpeople, of whom about 108,000 received advances and nearly 38,300 sustained decreases. The amount per head of the advances was, however, much less than that of the decreases, and the effect of all the changes was a nett decrease averaging 1½d. weekly per head of those affected. In the building trades employment is dull. It is slightly better than in the previous month, but shows little change as compared with a year ago. The percentage of unemployed trade union members among carpenters and joiners was 5·0 at the end of February, as compared with 6·4 in the previous month. The percentage for plumbers was 8·2 at the end of February, as compared with 6·7 in January.

The Building Trade of Hull is again threatened with a dispute of large dimensions, although it is hoped this will be avoided by the adoption of terms agreeable to both parties. The initiative in the matter has come from the masters, who are desirous of securing an alteration in the working rules. These rules were only agreed upon between the parties in May of last year, and it was understood they were to remain in force for at least two years. The employers, however, have served a notice upon the Building Trades Federation asking for an alteration. One of the principal changes they seek to effect has reference to short time during winter months. By the agreement come to last May, for five weeks before Christmas and for an equal period afterwards the men commence work at seven o'clock, having half an hour for breakfast, an hour for dinner, and cease at five o'clock. The masters want them to commence work at eight o'clock (having breakfasted before), have half an hour for dinner, and cease work at 4.30, the object being to secure the maximum amount of daylight each day. Another suggested alteration, and one which is strongly opposed by the men, has reference to the time when notice of a reduction of wages or lock-out can be given. By the existing rules that can only be given in May; the masters want the power to give it in November as well. The men have submitted counter-proposals. Negotiations are proceeding.

The Trials of a Surveyor.—A building at Llanfairfechan was recently ordered to be pulled down because it contravened the bylaws. When the surveyor to the urban district council arrived to carry out his instructions he found the builder warlike—aggressive enough, indeed, to throw three buckets of water on the surveyor, who then went away and returned another day with a policeman. The builder said that if they entered his premises there would be two or three of them in the hospital: at which the surveyor's men retired. The house is enclosed by chains back and front. Now the surveyor intends to lay an information for assault, and we await developments.

A New Building Stone.—Messrs. Woodford & Wing, of Stamford, the agents for the Edithweston Freestone referred to on p. 57 of our issue for March 11th, have recently also taken over the Peasenhurst quarries, near Ashover, lately worked by Robert Simpson. This bed of stone is of excellent quality and indeed it would be hard to find its equal in Derbyshire. In addition to its being one of the most durable of stones, it possesses a much desired feature in keeping its uniform and very pleasing colour. Entirely new and modern machinery is being laid down by the proprietors, who are already obtaining blocks of stone of very considerable dimensions. It is comparatively low in price. The stone is specially suitable for grindstones, kerbs, setts, &c., and orders can now be carried out, as the fixing of the machinery is nearly completed.

Fair Contracts Clause.—The special committee of the members of the Manchester City Council appointed to consider the fair contracts clause in its relation to im-portant building contracts held a meeting last week. Mr. George Macfarlane, the president of the Manchester, Salford and District Builders' Association, who is also the president of the Lancashire and Cheshire Builders' Federation, had an interview with the committee and suggested certain alterations of the scheme, and afterwards the committee heard the views of Messrs. G. D. Kelley and T. Fox, on behalf of the Manchester and Salford Trades and Labour Council. The committee expressed themselves as having been considerably assisted by the representations made to them. The difference between the two sides is said to be chiefly one of interpretation of the wording of the clause, and it is believed that after another meeting the committee will be in a position to submit a clause to the council which will be entirely satisfactory.

London County Council.—At last week's meeting of the Council the supplemental estimate of £24,500 was approved for the purchase of property and payment of compensation in connection with the construction of Greenwich Tunnel.—An estimate of £33,350 was approved for the additional widening of Southampton Row to 100ft. between Theobald's Road and Fisher Street, necessitated by the proposal to construct in the thoroughfare an open approach to the tramway subway.—Mr. Beachcroft moved a reference to the Highways Committee to report as to the comparative cost per mile of a tramway on the overhead system as compared with the conduit system, and whether there was any solid reason why the Council should not adopt the overhead system inside the county in those districts which are sufficiently removed from the crowded centre of London; but on a division the motion was rejected.—It was agreed that the Parks Committee be instructed to consider and report whether any measures are practicable in order to restrain owners from converting to building purposes small open spaces in the county of London which have been dedicated for use as "squares" and used as such for a long period of years.

Trade and Craft.

Anaglypta and Salamander.

"Anaglypta" and "Salamander" are already so well-known all over the country that, as materials, they need no further introduction; but we have always to note any new designs for them. Such designs are now before us in the new pattern book which has just been issued by the manufacturers—a large thick book containing several scores of designs, and very well produced. It is a regrettable fact that many manufacturers spend infinite pains on designs which have very little merit, but here in this book we see many admirable designs, the work of such men as Mr. George C. Haité, Dr. Dresser, Mr. Aumonier, Mr. T. R. Spence, Mr. C. F. A. Voysey and others. As a decorative material we consider "Anaglypta" admirable. Objection has been made by ultra-purists that it mimics plasterwork and is consequently not to be suffered; but one might just as well object to brass because it was much the same colour as gold. True, the material can be put to wrong use; we think, for instance, that it is a pity to make it appear to be wood panelling. The material has so much scope that to tie it down to the limits of other materials, such as wood, is to deprive it of its own merits, and to discredit it. We are glad, however, to see in this book that the designs respect the good qualities of the material, and that there is a freedom about them quite appropriate to "Anaglypta." The majority of the reproductions are from photographs, but often a line sketch is given suggesting a suitable scheme of decoration. There are, for example, photographic illustrations of a Louis XV. ceiling accompanied by a series of sketch plans and diagrams showing how ceilings of different sizes can be treated. These sketch plans are very useful. Suppose, for example, an architect put his plan on tracing paper at a scale of $\frac{3}{4}$in. to the foot; he can place this on the sketch plan of any desired design and see very easily how it will work out; moreover, it enables him to explain and satisfy his client on this point, and, finally, it can be handed over to the workman who is sent to fix the material, thus providing a safe guide and avoiding the risk of the work being clumsily done. The stopping of ceiling designs short of the cornice is often a necessity beyond that of giving the pattern a good finish; in many cases the cornice of a room is altogether too weak to carry a high relief ceiling, so that the addition of a margin and a moulding to edge a relief design gives width and strength to the cornice itself, and helps to bring it more into scale with the ceiling pattern. Many hints are given in this book about fixing "Anaglypta" and afterwards decorating it; and these admirably supplement the numerous designs. Architects and builders should secure a copy of the book, which should be indispensable to them. The works of the Wallpaper Manufacturers, Ltd. (Anaglypta Branch) are at Darwen, and the London warehouse at 92 and 93, Great Russell Street, W.C.

Sewerage Ironwork.

Mr. William E. Farrer, of 36, Cannon Street, Birmingham, has issued an admirable catalogue showing manhole covers and frames, gulleys, traps, ventilating shafts, valves, penstocks and other sewerage ironwork. Many of the illustrations are from photographs. The lamphole and manhole covers shown have wood blocks on the underside and are of square, rectangular, circular and oval form: a very neat airtight cover for inspection chambers, with grease joint and flange for letting into asphalt, &c, is illustrated on p. 9. Some improved galvanized *malleable* step irons are also shown, the iron being made with a web on the underside of the arms, exactly receiving a header brick, while the stretcher, when fixed on top, immediately binds it in position—there is no cutting of brickwork or wide joints. The valves illustrated include hand-flushing, disc, reservoir outlet, floating outlet (to draw off water or other liquid from near the surface without taking scum), sluice, sludge, and reflux and back-pressure valves: in addition to which are tide flaps and penstocks of several kinds, one quick-action penstock having toggle levers. Farrer's patent bead-rim effectually prevents the water from washing over the edges of lavatory basins of every pattern. It is an up-to-date improvement of the old anti-splash rim in which soapy scum and dirt used to settle. Another speciality is "Torfit," a specially-prepared composition for urinal backs, &c., which has the peculiar quality of rendering urine innocuous immediately on coming in contact with it; thus preventing noxious smells. Mr. Farrer has recently removed his works from Fawdry Street, Smethwick, to larger and more central premises in Cambridge Street, Birmingham.

Royal Academy Exhibition.

The receiving day for architectural works at this year's Royal Academy Exhibition is Friday, March 27th. We shall be pleased, as in previous years, to receive drawings from intending exhibitors, and undertake to deliver them at Burlington House free of charge; but they must reach us at latest by noon on the day mentioned. The earlier they are sent the better All drawings must have the necessary labels attached to them.

Bankruptcies.

[Abreviations: R O.—receiving order; P.E.—public examination; C.C—county court; O.R.—official receiver.]

J. ATKINSON, builder, Rodley, Leeds. R.O. March 13th.

J. O. BOWER, builder, Aberfan, Merthyr Tydfil. R.O. March 11th.

CHALLISS & CHALLISS, builders, Maidstone. P.E. March 11th. Deficiency £483.

J. BOOTH, builder, Burslem. Gross liabilities £1,058; £435 expected to rank for dividend; assets £346.

C. STOTTER, brick manufacturer, Enfield. R.O. March 10th.

G. A. DUFFIELD, builder, West Tarring. P.E. held March 12th. Liabilities £491: assets £170. Adjourned.

R. ROUGHTON, builder, Wisbech St. Peter, Cambs. R.O. March 11th.

H. HUDSPITH, builder Gateshead. R.O. March 9th. P.E. Newcastle County Court, March 26th, at 11.

J. E. BARRETT, Lees, near Oldham. First meeting O.R.'s, Oldham, March 31st at 11.30. P.E. April 17th at 11.

T. WARDEN, builder. 3, Beckingham Road, Leicester. P.E. The Castle, Leicester, April 3rd, at 10.

R. S. BUCKERIDGE, builder, 37, High Street, Manchester Square, London, W. First meeting, Bankruptcy Court, March 26th, at 12. P.E. April 29th at 11.30.

C. BUTLER, builder and contractor, 20, Bucklessbury, London, E.C., and Westcliffe-on-Sea. R.O. March 10th. P.E. Bankruptcy Court, April 29th, at 11.

W. TODD, joiner and builder, Ainsdale, Liverpool. Liabilities £620; assets £232. P.E. adjourned till April 9th.

E. J. LEESE, builder, Wrockwardine Wood, Salop. R.O. March 9th. First meeting, Madeley C.C, April 1st at 12 30.

W. THOMPSON, builder, 81, Bishopsgate Street Within, London, E.C. Meeting of creditors held March 17th Liabilities £2,000; assets £10.

W. PHILLIPS, builder, Castle Street, Abertillery. Meeting of creditors at Merthyr on March 16th. Gross liabilities £5,138; deficiency £2,343. Failure attributed to losses on contracts.

F. H. WHITE, builder and contractor St. Leonards. Adjourned examination held March 10th at Hastings. Debtor said he did not know how £1,500 was lost during the last ten years. Examination adjourned.

T. TAYLOR. builder, 23, King's Road, Bengeworth Evesham. First meeting of creditors at Worcester on March 14th. Liabilities £495; assets £113. Failure attributed to losses on contracts and keen competition. The assistant official receiver pointed out that as debtor commenced with a capital of £7 he was only that amount the worse off, while his creditors had to suffer a loss of £375.

E. C. TREW, builder, Boston Avenue, Southend. Discharge applied for at Chelmsford on March 11th. Liabilities £1,352; assets £221. It is expected that no dividend will be paid. Debtor was hopelessly insolvent from the time he started business. He kept his books in a very negligent way, and there was a deficiency of £3,365 not accounted for. The judge, in suspending the discharge for five years, said that people who supplied speculative builders with material without proper enquiry were more or less making themselves party to the speculations.

M'KISSOCK & GARDNER, contractors, 180, Hope Street, Glasgow. Liabilities £11,804; assets £5,823; showing an apparent dividend of 9s. 10d. per £1 subject to the expenses of realization. The present statement was made on the basis that the unfinished contracts would be taken up and finished by the trustee. The City Improvement Committee held a special meeting to consider the position of the contract between the Corporation and the debtors for the digger, mason and brick work of the buildings being erected in Nelson Street and Bell Street. The original amount of the contract was £14,881 7s. 8d., but extra work sanctioned by the committee, amounting to about £875, had to be added to the original contract price. The work executed by the contractors and paid for by the Corporation up to January 6th amounted to £12,150, leaving about £3,606 7s. 8d. of work still remaining to be executed under the contract. The retained fund under the contract amounted at January 6th to £1,450, but £500 of this sum was paid to the contractors on January 26th, leaving £850 still in the hands of the Corporation.

Guaranteed Gearing

ROBERT ADAMS,
65 & 67, Newington Causeway, LONDON, S.E.

The Originator and Leading Maker of the Modern System of Ventilating Gearing.

HIGHEST AWARDS AT PARIS, 1900.

Coming Events.

Wednesday, March 25.

Society of Arts.—Mr Arthur Kitson on "Oil Lighting by Incandescence," 8 p.m.

Builders' Foremen and Clerks of Works' Institution.—Quarterly meeting of the Directors at 8 p.m.

Dover Institute.—Mr. E. H. Montauban on 'Lighthouses," 8 p.m.

Chemical Society.—Annual meeting at 4.30 p.m.

Edinburgh Architectural Association. Mr. A. Hunter Crawford on "The Building of a House"—IV., 8 p.m.

Northern Architectural Association.—Lecture by Mr. R. P. S. Twizell, A.R.I.B.A., at 7.3, p m.

Thursday, March 26.

Society for the Encouragement of the Fine Arts.—Sir Wyke Bayliss, P.R.B.A., on "The Bogey in the Studio."

Leeds and Yorkshire Architectural Society.—Mr. Robert P. Oglesby on "Sir John Vanbrugh, Dramatist and Architect." Election of Officers, 6.30 p.m.

Institution of Electrical Engineers.—Mr. A. D. Constable and Mr. E. Fawsett on "Distribution Losses in Electric Supply Systems." Mr. M B. Field on "A Study of the Phenomenon of Resonance in Electric Circuits by the Aid of Oscillograms," 8 p.m.

Society of Antiquaries of London.—Meeting at 8.30 p.m.

Friday, March 27.

Institute of Sanitary Engineers.—Examination in Practical Sanitary Science (1st Day).

Incorporated Association of Municipal and County Engineers, Westminster Palace Hotel.—Discussion on "Wooden Structures and the Powers of Metropolitan Borough Councils with respect thereto," opened by Mr. J. Patten Barber, 7.30 p.m

Institution of Civil Engineers (Students' Meeting).—Mr. J. G. D. Y. Morgan on "The Advantages of Motor-driven Printing Machines," 8 p m.

Saturday, March 28.

Institute of Sanitary Engineers.—Examination in Practical Science (concluded).

Builders' Foremen's Association.—Mr. A Adams on "The Manufacture of Fletton Bricks," 8 15 p.m.

Edinburgh Architectural Association.—Visit to Darn Hall.

Monday, March. 30.

Royal Institute of British Architects.—Mr. Horatio Porter on "Fire Prevention," together with a report by the Science Committee on the Fire Offices Regulation.

Tuesday, March 31.

Architectural Association of Ireland.—Meeting at 7.45 p.m.

Institution of Civil Engineers.—Discussion on Mr. Amyas Morse's paper on "The Protection Works of the Kaiser-I-Hind Bridge over the River Sutlej, near Ferozepur," 8 p.m.

Wednesday April 1.

Architectural Association (Discussion Section).—Mr. A. M. Watson on "Some Unorthodox Views about Building," 7.30 p.m.

Edinburgh Architectural Association.—Mr. Frank Caws, F.R.I.B.A., on "A Plain Talk on Fireproof Floors and Construction," 8 p.m.

Thursday, April 2.

Society of Antiquaries of London.—Meeting at 8.30 p m.

Chemical Society.—Meeting at 8 p.m.

Friday, April 3.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.—Business meeting at 8 p.m.

Institution of Junior Engineers —Mr. William Paterson on "Greasy Condensation Water as Boiler Feed," 8 p.m.

Architectural Association.—Mr. Banister F Fletcher on "Palladio," 7.30 p.m.

Saturday, April 4.

British Institute of Certified Carpenters.—Meeting at Carpenters' Hall at 6 p.m.

Glasgow and West of Scotland Technical College Scientific Society.—Annual general meeting at 7 30 p m.

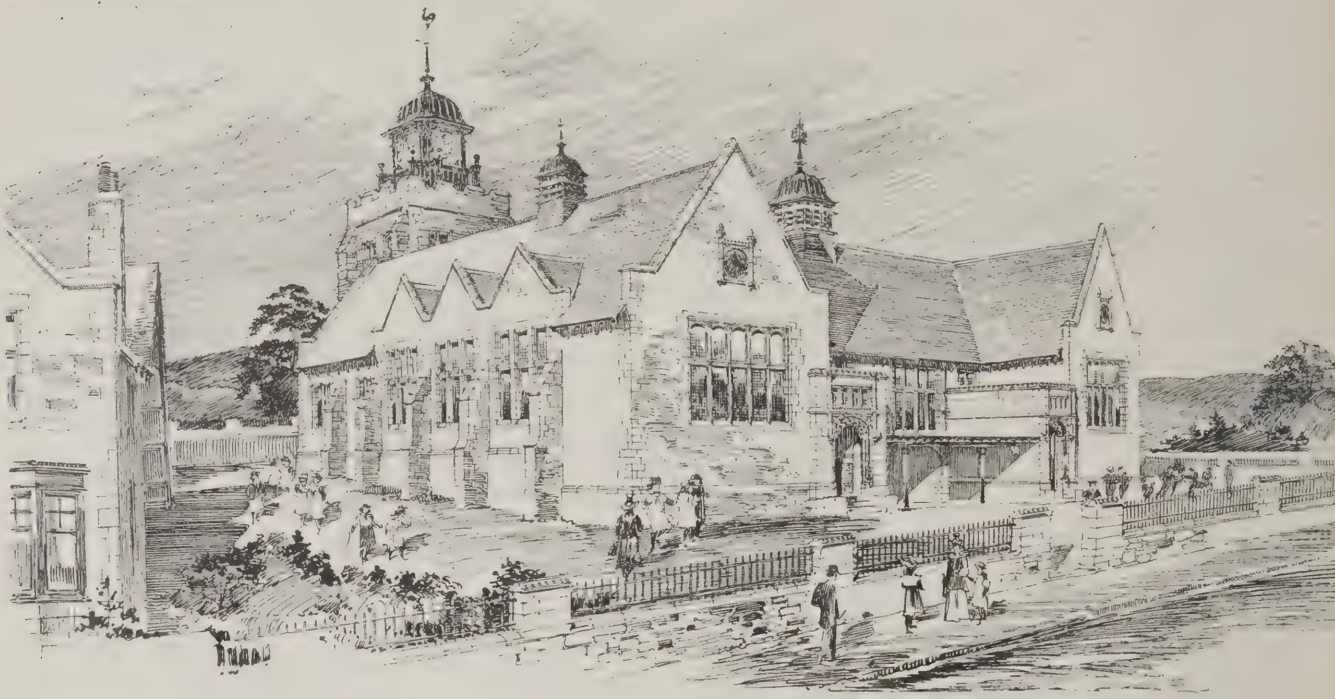
9, East Harding Street, E.C.

An American Professor. THE announcement will be read with considerable interest that an American professor has been chosen for the newly-constituted Chair of Architecture at Owens College, Manchester—chosen by the joint committee representing the Manchester City Council, Owens College and the Manchester Society of Architects. Professor Stewart H. Capper, M.A., is recommended. He has held a professorship of architecture in the McGill University of Montreal since 1896. He graduated in first-class classical honours in 1880 in Edinburgh, having previously attended classes at the University of Heidelberg, and also secured the Pitt Club scholarship in classics. From 1879 to 1884 he acted as private tutor and private secretary in the household of Sir Robert Morier, British Minister at Lisbon, and subsequently at Madrid. From 1884 to 1887 he studied with M. J. L. Pascal, architect member of the Institute of France, and was admitted by examination a student of the École des Beaux-Arts. Returning to Scotland in 1887, he entered upon the work of practical architecture, and from 1891 to the time when he was appointed to the Architectural Chair of Montreal practised his profession in Edinburgh. The new professor is also an Associate of the Royal Institute of British Architects, and has lectured and examined for the Edinburgh University in archæology and art for the M.A. degree. It is expected that Professor Capper will return to England and begin the duties connected with the Manchester Chair of Architecture next autumn.

Next to Shakespeare's Birthplace. WE heartily support the protest which is being raised against the proposed erection of a free library within twenty-five yards of Shakespeare's birthplace at Stratford-on-Avon. If the town wants a free library, by all means let one be erected—it was very generous of Mr. Carnegie to offer the money—but there is no reason why it should be put up in Henley Street: there are other sites available in the town where the library could be placed with equal convenience and without disturbing the serenity of a Mecca. As Mr. Sidney Colvin says, there is plenty of room for it in connection with the Memorial Theatre. Mr. Carnegie, it appears, bought the three cottages standing between the birthplace and a piece of ground partly vacant and partly occupied by a shop belonging to the town council. On this ground the library is proposed to be built. The cottages are old—one of them is stated by Miss Marie Corelli to have been in existence before Shakespeare was born—but it is not so much their demolition that is objected to (in fact, it is suggested this might be justifiable for the sake of better protecting the birthplace from fire): it is the discordant note which the new library is bound to produce, however carefully it may be treated. One is surprised that this should have been ignored by an ex-mayor of Stratford to the public spirit of whose family the Memorial Theatre was due. We trust that the protest now being made will effectually prevent the erection of the library where its presence would be so undesirable.

Vox Populi. THE promoters of the competition for a new Baptist Chapel at Wavertree, Liverpool, evidently believe in selection by the majority. The conditions stated that a professional assessor would be appointed "to adjudge the plans and advise the committee in their selection," and that the competition, being an open one, would be regarded "strictly in accordance with professional etiquette." But we have before us the circular which they issued to persons interested, inviting them and their friends to inspect the designs (between thirty and forty of which were exhibited) and to give the committee the benefit of their judgment by entering their choice in a book provided for the purpose. This is indeed a new etiquette! Apart from the discourtesy to the assessor, the idea is perfectly foolish. What on earth does the ordinary layman know about architecture? It is difficult enough for a trained mind to make a selection out of a number of competitive designs—difficult enough when he knows what a plan should be, what is good construction, what is meritorious in an elevation. Yet here is the layman's opinion invited to supplement the assessor's, the layman who would choose the "prettiest" design and probably never give a look at the plan. We can only repeat that this is a pure piece of foolishness. It is astonishing that any committee should have shown such discourtesy to their assessor and exhibited such an ignorance of the "professional etiquette" which they are so eager to observe. It is just such abuses as this which bring the competition system into bad repute among architects.

For French Architecture. THE teaching of architecture in France is about to enter on a new era, and one which is likely to effect very considerable changes. Paris architects are, of course, all trained in the École des Beaux-Arts, and the result of that training is apparent in the city's buildings. Whatever others may think of it, whether or not they like its uniformity, its academic refinement, its studied orderliness, the French authorities believe in it thoroughly; so that they have decided to extend the system into the provinces. Candidates are to be examined all over France on the same day and their work adjudged by a committee of Parisian and provincial architects, the object being to secure uniformity of standard. The successful candidates, who will thus become students of the regional schools, will be placed on the same footing as their fellow-students in Paris, and may compete for all the Beaux-Arts prizes, with the exception of the diploma in architecture—yet for this, though it will still be held in Paris, provincial students will be able to gain the necessary "values" in their own towns. The Government has already notified the local authorities of its intentions, and a commission is about to start on a tour throughout the provinces to settle details. A subsidy will be granted to every school. It will thus be seen that French architecture is likely to become even more consolidated into one style. Naturally, the system is not without its disadvantages, but we have already pointed out that, so far as civic and monumental buildings are concerned, the results—taken as a whole—are far more satisfactory in the French capital than they are in London. Domestic architecture is another matter: there we may claim an undeniable superiority; but we could wish the architecture of our towns and cities were looked after so well as it is in France. While, however, we see the good points of this new Government scheme, we cannot forget that a similar practice is to some extent adopted by the South Kensington authorities; and we know from experience that the results in the provinces, under less competent (sometimes incompetent) masters, are not on a level with those of students in London working under the very best masters. But the French seem to be looking after their system better than we have done, and the defects we mention may possibly be so minimised as to be unappreciable.



PUBLIC SCHOOL, THORNLIEBANK.

MEN WHO BUILD.

No. 69.—W. G. ROWAN, I.A.

ARCHITECTURE is a science, and as such is universal: it is also an art, and as such must always be individual. This is perhaps not thought of so much in considering the works of past ages as when considering those of the present time; but did we know sufficient of each dead style we should be able—and, indeed, often are, even without the aid of history—to detect the work of the individual in the style. To-day, when almost all the past styles are practised, personality is the charm we most naturally look for in our architecture. It may be carried too far, however, and so become mannerism; but in its proper place it is the *sign manual* of the master and an indispensable quality that goes to the making of architecture.

In the work of Mr. Rowan we find this individuality. It would be difficult to say exactly just where it begins and where it ends, but it is there unmistakably, even in a gas bracket or a door-plate, and it is this which gives his work its charm: it is distinctive.

Present-day architecture is specialized: we have ecclesiastical architects, school architects, and architects who make domestic work their particular study—besides quite a number of less worthy kinds of architectural specialism. These architects may not have started in life with the intention of specializing, but gradually, maybe almost imperceptibly, they have glided into a department of work for which they have won "a name."

Mr. Rowan has come to be known as a church architect, not because he has not done much excellent work outside its pale but because his works for this purpose are more numerous and characteristic. His domestic, school and other buildings have character unmistakably, but in his church work that character has a nobler expression, a freer flow.

As examples of his non-ecclesiastical work we publish drawings of a school at Thornliebank, of a small house at Busby and of a terrace of houses at Bo'ness.

In church work the architect usually has a freer hand, not always in expenditure (that is sometimes very rigorously curtailed), but the lines the architect has to go on are here more architectural in their possibilities. His fancy may be curtailed, but the broad lines of monumental purpose will remain if the architect has been artist enough to seize the possibilities of his problem. The chief obstacle that the architect (in Scotland, at least) has to contend with in ecclesiastical work is his church committee. Committees are always difficult to move, and their artistic ideal is generally a very low one. For example, galleries are insisted on, and probably around three sides of the church. Then the committee will not hear of a stone arcade: that obstructs the view, and the congregation must see as well as hear, and no æsthetic consideration will compensate for the lack of either of these. It is proposed that the architect use cast-iron columns, as spidery as possible, to support his galleries, and he is lucky indeed if able to persuade his committee to adopt anything more pleasing to the eye of the artist. Mr. Rowan has had his full share of these difficulties, yet in spite of them he has triumphantly produced many fine churches.

The admirable perspective views of Trinity U.F. Church, Pollokshields (by Mr. Alexander McGibbon), show how Mr. Rowan has managed to overcome these difficulties and, accepting the necessity of an organ, has clothed and made it part of the decorative scheme of the church interior. As another example, let us take the small village church at Tollcross, illustrated on p. 102. This church has been designed without extravagance of any kind, yet the effect both of exterior and interior is good. Other delightful examples of this picturesque treatment are his mission church at Bo'ness, his Norman church at Cambuslang, and his Perpendicular church at Blantyre.

But these are village churches, and, given a moderately liberal rate per sitting, an architect can always make something of his problem. It is in the town church that the architect encounters most difficulties. The site is limited and confined, the accommodation required large, the church committee exacting. The Wynd Church and Sommerville Memorial Church are examples in which these difficulties have been overcome. In his Cunningham Free Church, while Mr. Rowan has been equally successful in overcoming these obstacles and in retaining his ecclesiastical feeling, he has succeeded in conveying a modern note to his design.

It is in the mass and outline of his building that an architect shows his natural genius; it is in the working out of his plan, construction and detail that he shows his technical skill and assiduity of attention: Mr. Rowan has both, but the latter especially is very observable. In his fitments, particularly his ironwork, all of his designs are in their way excellent and distinctive.

Starting first of all with the classic style Mr. Rowan is, together with his former partner Mr. McKissack, responsible for several churches in this style. But he never appears to have developed on these lines; instead, he has gone entirely over to the Gothic school, all his recent churches being in the Perpendicular, or a free treatment of that style, with the exception of those in Norman or Romanesque. Like most architects, Mr. Rowan has done a good deal of competitive work. It is somewhat saddening to think how few of the best schemes are executed, or, if built, built in all their original splendour, and how many are cut down to the bone of bare necessity. Examples of churches one would have liked to see in stone are Mr. Rowan's competitive design for Belmont Church, his Juniper Green Church, and his St. Andrew's Church, Ayr.

Architecture is an art in the practice of which the ideal may very easily be lost. Unlike her sister art, Music, the material enters so largely into her conceptions that if this be withheld, or but sparingly granted in inferior qualities and insufficient quantities, there is a great danger of the architect degenerating into the mere builder. This being so, praise should always be given to the architect who, like Mr. Rowan, while battling with the problems of this life, ever holds firmly to the high ideals he has set before him. J. W.

Views and Reviews.

Art of the East.

Some considerable knowledge of Japanese, Chinese and Indian history is needed to understand this book properly, and even then we fear it will not be thoroughly intelligible to a Western mind—not even with the "notes" at the end of each chapter. The author is, we are told, the foremost authority on Oriental archæology and art, a man who is recognized by his Government and is regarded by the writer of the introduction to this book (one Nivedita, of Ramakrishna-Vivekânanda) as in some sense the William Morris of his country. It is the culture of Continental Asia, he says, that converges upon Japan and finds free living expression in her art; and its great characteristic elements are not a few drawings of plum blossoms, but the mighty conception of the Dragon; not birds and flowers, but the worship of Death; not a trifling realism, however beautiful, but a grand interpretation of the greatest theme within the reach of the human mind—the longing desire of Buddhahood to save others and not itself—these are the true burden of Japanese art. Into the intricacies of those ideals we do not propose to enter, neither into the religious systems, the beliefs and the dynasties of Japan which are dealt with throughout this book: instead we shall extract a few observations about architecture and sculpture. The primitive spirit of Japanese art—"that tender simplicity, that romantic purity . . . differentiating it at once from the leaning to monotonous breadth of the Chinese, and from the tendency to overburdened richness of Indian art"—was never allowed to die: "it modified the tilted roofs of Chinese architecture by the delicate curves of the Kasuga style, in Nara." This style was a development of the Shinto style of Isé and Idzumo, and is characterised by very delicate curves, which take the place of the straight lines of Yamato or pre-Japan architecture and the exuberant canvas-like curves of the Chinese: and it is interesting to note that the temples of Isé and Idzumo, both of wood, have each an alternative site on which they are rebuilt every twenty years in a style suggestive of development from the architecture of the bamboo cottage, or the log hut, still to be seen on the south-eastern coast of Asia. The first wave of Continental influence which swept over the art of primitive Japan, before Buddhism reached it in the sixth century, was that of the Hâng and the Six Dynasties of China (the first being Shin—hence Shin-land, China). The architecture of the Hângs—who spread Confucian ideals as the Romans did Hellenic culture—is characterized by gigantic palaces, adorned with caryatid pillars and profuse carving, colossal statues, stupendous towers and great structures in wood and brick—an era, too, of military works, when the Shin emperors left their memorial in the Great Wall.

With the formal introduction of Buddhism into Japan in A.D. 552 came the changing of palaces into Indian temples, when the stupa, translated into Chinese forms under the conditions of wooden architecture, became the pagoda. Sculpture followed a parallel course. The Nara period (700 to 800 A.D.) was one of immense bronze figures, culminating in the Roshana Buddha. The periods that followed saw returns from profuseness to severity, from luxury to refinement, till at length we reach modern times, with the meeting of East and West—and the great mass of Western thought becomes perplexing. "The mirror of Yamato is clouded, as we say . . . if there be indeed any spring of renewal hidden in our part, we must admit that it needs at this moment some mighty reinforcement, for the scorching drought of modern vulgarity is parching the throat of life and art." The task of Asia to-day becomes that of protecting and restoring Asiatic modes, and it is to that task Mr. Okakura applies all his wide learning and talent. He has already done much and his influence is felt increasingly for a strong re-nationalizing of Japanese art in opposition to the pseudo-Europeanizing which has done so much harm throughout the East.

"Ideals of the East, with special reference to the art of Japan," by Kakasu Okakura. London: John Murray, Albemarle Street, price 5s. nett.

Palestine Exploration.

In this book are set forth the results of two years of exploration in the "low country" of Judah—more especially at Tell es-Sâfi, which has been identified with Gath. The Turkish authorities stipulate that all objects discovered are to be the property of the Imperial Museum, the excavators having only the right to make drawings, photographs and casts. From these latter this book is profusely illustrated: but we must frankly confess that the great many pottery and similar objects discovered have no interest for us as an architectural and building journal. In looking at them, however, one sees again that the Jews had no art of their own, that their works were directed by their conquerors. At Tell Zakariya, not far from Jerusalem, a fortress was excavated (built of rubble laid in mud mixed with straw, without lime) which seems to have been the work of Rehoboam (2 Chr. xi. 5–10). At Tell es-Sâfi the ramparts of the ancient city were unearthed (the entire absence of mortar rules out the Crusaders as the builders). The wall is very rudely built and has been plastered in parts with mud and straw, over which is a whitish plaster made by mixing unburnt limestone with straw and water—a plaster used in Lebanon to this day. Inside the enclosure were found a number of chambers, some with the unmistakable fine diagonal chiselling of the Crusaders. At Tell ej-Judeideh the excavations chiefly consisted in tracing the city wall and the remains of a Roman villa: and at Tell Sandahannah the levels of two towns—the lower Jewish, the upper Seleucidan—were explored. Many interesting archæological finds were made, and these are particularly well described in detail by Mr. Macalister.

"Excavations in Palestine during 1898-1900," by Frederick Jones Bliss, Ph.D., and R. A. Stewart Macalister, M.A., F.S.A., with a chapter by Prof. Doctor Wünsch. London: Palestine Exploration Fund, 38, Condult Street.

W. G ROWAN, I.A.

The Compleat Carpenter and Joiner.

The promise displayed by the two first volumes of this elaborate work is well sustained by the third and fourth volumes, which are characterized by great thoroughness. They reflect much credit on the editor, Mr. G. Lister Sutcliffe, who contributes all the matter appearing in these two latter volumes. Vol. III. begins with a well-illustrated section on drawing and drawing-instruments which is altogether admirable. The next section, on Practical Geometry, is elaborate, but by its very elaboration destroys its usefulness as an instruction book for the beginner. It, of course, has value for reference purposes, when one desires to solve a problem exactly on the same lines as one in the book without taking any trouble to work it out, which would require a thorough knowledge of the principles; but to read it through would be as tiresome as most books on geometry are. There is no valid reason why the subject should be treated so confusingly. A master would be able to overcome the involved and awkward nomenclature generally employed and to deal with it entertainingly and instructively. The same criticism applies, though not in so great a degree, to the first section in Vol. IV., upon the theoretical mechanics of structures. Moreover, this section has the fault of all the text-books on carpentry and joinery that have been published—it is too elementary. Very little more space would have been required to treat the subject in an original and comprehensive manner. We notice that the more difficult problems of roof-trusses when subjected to wind-pressure and unequal and oblique loading are neglected as hitherto: but it is just these which the practical man requires solved. No examples of indeterminate forms are given. Then, again, no attention is paid to vibratory loads on structures; the necessity is apparent when we remember the recent disaster at Ibrox Park, Glasgow, where a wooden stand collaped, with fatal results—a disaster which arose solely from the ignorance displayed in the design of the stand. The section devoted to the physical and mechanical properties affecting the strength of timber is an excellent summary of the facts available, the tests which have been carried out, &c., but it has not been treated in any very original and informing manner. The section on Carpentry is commenced in this volume, the chapters dealing with joints, methods of lengthening timber, compound timber beams and carpenters' ironwork. This is very well illustrated with numerous clearly-drawn diagrams.

"The Modern Carpenter, Joiner and Cabinet Maker," edited by G. Lister Sutcliffe. Vols. III. and IV. London: The Gresham Publishing Co., 34, Southampton Street, Strand, W.C.

SOMMERVILLE MEMORIAL CHURCH, KEPPOCHHILL, GLASGOW. W. G. ROWAN, ARCHITECT.

LIGHTNING RESEARCH COMMITTEE.

Interim Report of Observations.

THE Committee formed two years ago by the Royal Institute of British Architects and the Surveyors' Institution to investigate the action of lightning strokes on buildings, with a view to the improvement of current methods of protection, have circulated among their observers a summary of cases recorded for the Committee of buildings struck by lightning and damaged during the year 1902.

At the beginning of the year the Committee considered that the previous year's observations had given them all the data needed as regards non-protected buildings, and they decided to confine their attention for the future to cases where buildings were struck and injured in spite of the provision of lightning-rods for their protection. Out of sixty cases recorded for the Committee in 1901 no fewer than twelve were of buildings fitted with some form of lightning-conductor. Considering the numerical ratio of protected to non-protected buildings, and allowing for the fact that protected structures are usually in some of their parts in more exposed positions than the non-protected, the proportion must be considered extremely unequal.

In face of some recent disasters brought to the notice of the Committee it is not surprising that dissatisfaction is felt with the system recommended by the Lightning Rod Conference of 1882. Last year the Committee's observers sent in reports of sixteen protected buildings struck by lightning—some slightly, others very seriously injured or entirely destroyed in parts. Details of these will be given in the final report of the Committee, together with comments. An interesting case may be quoted. It is that of a large country-house in Sussex, erected about twenty-eight years ago, and till recently without any form of protection. In 1901, a church in the immediate neighbourhood having been struck, the owner of the house, for greater security, decided to have lightning-rods put up. An elaborate system was installed, and completed in March, 1902, nearly every portion of the building having its own finial and conductor. During the storm season of last year the house was twice struck—on June 7th and on August 8th. On each occasion, besides other injuries, a chimney-stack was damaged, the brickwork being split up and the capping-stones dislodged and hurled about in all directions. The lightning-rods on the damaged chimneys were torn from their supports and much bent.

Other protected buildings recently struck of which reports have been received include All Saints' Church, Boyne Hill, Maidenhead; St. Andrew's Church, Mark's Tey, Essex; New St. Pancras Church, Marylebone Road; Swanscombe Church, Kent; St. Botolph's Church, Aidgate; St. Michael's Church, Highgate; Devaar Island Lighthouse, Argyllshire; South Foreland Lighthouses; Factory chimney, Nelson, Lancs; Cavendish Laboratory, Cambridge; Tiffin's School, Kingston-on-Thames; Ainsworth Mill, Lancaster.

All these cases are being carefully studied by the Committee. They hope to be in a position to report on the whole question of lightning protection at the end of the present year, and to offer some suggestions for more efficiently guarding buildings. Meanwhile they desire the continued co-operation of observers in this important enquiry, it being necessary that they should be supplied with as complete details as possible of "protected" buildings, to enable them to arrive at the causes of failure of the means of protection adopted.

The Committee are contributing an exhibit to the Loan Section of the International Fire Prevention Exhibition to be held at Earl's Court this year, and invite the loan of objects of interest appertaining to the subject for the purpose of adding to their collection. Anyone in possession of relics of lightning disasters, and willing to lend them, is requested to communicate with the secretary to the Committee at 9, Conduit Street, W.

The Committee is constituted as follows:—Mr. John Slater, chairman; Sir Oliver Lodge, Major-General E. R. Festing (Director of Science Museum, Victoria and Albert Museum), Mr. J. Gavey (Engineer-in-Chief, G.P.O.), Mr. W. P. Goulding, Prof. W. N. Shaw, Mr. H. Heathcote Statham, Mr. A. R. Stenning, Mr. Arthur Vernon (president of the Surveyors' Institution) and Mr. Killingworth Hedges, hon. secretary.

TERRACE AT BO'NESS. W. G. ROWAN, ARCHITECT.

WARMING.

By B. R. TUCKER, M.S.A., M.S.I., Late Chief Surveyor, War Office.

THE first part of Mr. Tucker's paper on "Ventilating and Warming," read before the Society of Architects on March 19th, was published in our last issue; the latter portion, which we were obliged to hold over for want of space, is now given.

Mr. Tucker said:—

There are three principal systems of heating rooms and buildings: (*a*) hot-water pipes, low-pressure, when the temperature does not exceed 212 degs. Fahr.; (*b*) hot-water pipes, high-pressure, when the temperature is about 350 degs. Fahr.; and (*c*) steam—about 350 degs. Fahr.

Open Fireplaces.

The domestic open fireplace is the most popular form of heating. It acts chiefly by radiation. It is extravagant, as much of the heat passes up the chimney; at the same time it acts as a good ventilator; consequently no inhabited room should be without a fireplace. The Teal slow-combustion grate and others of similar construction are an immense improvement on the "Register" and similar patterns. Fireplaces should be placed in the inner walls of houses, where they warm the house generally.

Closed Ventilating Stoves.

These stoves are of great service in large rooms; they are more economical in fuel than open grates and they distribute the heat much more satisfactorily. They are apt to get too hot, and by so doing burn the organic matter in the air and produce an unpleasant smell. This description of stove should be lined with firebrick and have air-channels formed in it for heating the fresh air with which it should be supplied by means of a duct communicating with the external air.

Gas Stoves

have come largely into use, but until gas is supplied at about 1s. 6d. per 1,000 cub. ft. (which it could be if required for heating purposes only) heating by gas stoves must be more expensive than by coals. Gas stoves should never be used unless they have a proper flue for removing the products of combustion. They are cleanly and very convenient.

Ventilating Grates.

These grates have an open fire and are constructed on the most approved principle; they have a chamber behind for warming the fresh air which is supplied by a duct connected with the external air. The air when warmed in the chamber is conveyed up a flue passing at the side of the smoke flue, and escapes through a louvred opening in the chimney breast. Galton's grate, used in barrack-rooms, is on this principle. It is most economical in fuel, as all the heat generated is utilized in warming the room. A certain quantity of heat, of course, passes up the chimney, but that is of service in assisting ventilation by causing the vitiated air to pass more freely up the smoke flue. As these grates warm only half the fresh air admitted into the room, they cannot overheat the air generally so as to render it too dry.

Hot-Air Apparatus.

In this system the fresh air is admitted into a chamber (generally placed in the basement) where it is filtered and warmed by passing it through a stove, which should be of large area and moderate temperature, rather than small, requiring a high temperature which would render the air too dry. After being warmed, it is conducted along ducts of proportioned sizes and discharged through grated openings in the floor of the room. This method of warming is sometimes adopted in halls, churches and similar buildings. It is difficult to ensure a uniform distribution of the air throughout the building. It requires great attention to prevent over-heating, by which the air would be rendered too dry for breathing. The warmed air is liable to some pollution by being conveyed through dusty ducts or channels on its way to the outlets in the floor. There is another and greater objection to this system of warming—it is that the air is warmer than the walls and furniture; consequently, the bodily heat of the occupants is radiated to these, causing, as a consequence, a sensation of draught or chill, whilst the bodily resistance to chill is reduced by the enervating effects of warmed air. To ensure the proper working of this system, it should be assisted by hot-water pipes and radiators, for the purpose of heating the surfaces of the walls and windows.

ST. JOHN'S WESLEYAN METHODIST CHURCH, SAUCHIEHALL STREET, GLASGOW.
W. G. ROWAN, ARCHITECT.

Hot-Water, Low Pressure.

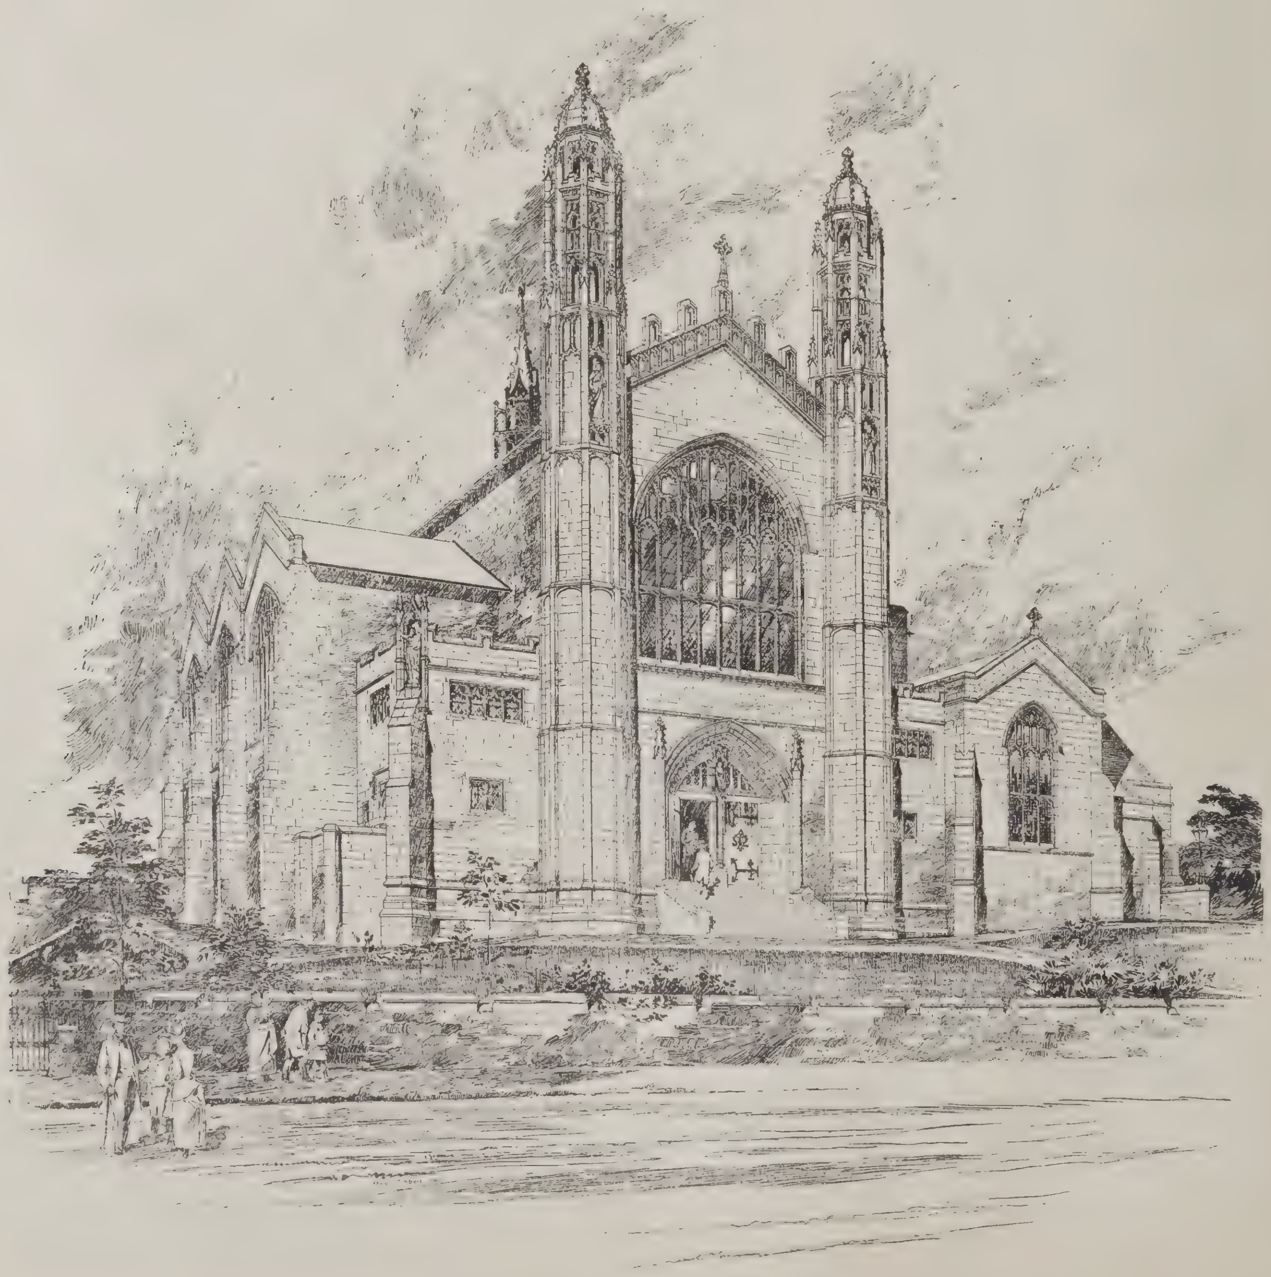
This apparatus consists of a boiler (usually placed at the lowest position) from which cast-iron circulating pipes of 2in. to 4in. diameter pass round the portions of the building to be heated. The principal circulating pipes are called "flow" and "return"—the former convey the heated water from the boiler and the latter return the cooled water back to the boiler to be re-heated. From these pipes the supply pipes to coils and radiators are connected. A supply cistern is placed at the highest point, to replenish any waste in the water, and to permit of its expansion when heated. The water is seldom heated above 180 degs. Fahr., and never beyond 212 degs. Care should be taken to remove all air in the pipes, by means of air vents or taps. This system is the most general in use; it is safe and efficient, easily worked and economical. It supplies a moderate wholesome heat, and as there is a large body of water the heat is more uniform than in any other apparatus. This system is the only one suited for horticultural buildings.

Hot-Water, High Pressure.

This apparatus consists of a continuous circuit of stout pipe, having an internal diameter of from $\frac{5}{8}$in. to $\frac{7}{8}$in., according to the size of the installation. One portion of the circuit, from $\frac{1}{12}$th to $\frac{1}{6}$th of its length according to circumstances, is formed into a coil, which is placed in a stove or furnace, by means of which the apparatus is heated; the remaining portion of the circuit is distributed throughout the several rooms to be heated. The water, when heated, flows from the top of the coil in the furnace to the highest point of the building and thence back to the bottom of the coil to be again heated. Provision is made for the expansion of the water when heated by the insertion of an expansion tube at the highest part of the circuit. This expansion tube is so proportioned that it prevents an undue pressure on the pipes which might cause them to burst. The expansion tube should equal about $\frac{1}{10}$th the capacity of the pipes. The pipes are filled with water and then sealed up and tested to about 2,500lbs. to the sq. in. In practice they are often heated to 350 degs. Fahr., or 9 atmospheres, about 135lbs. to the sq. in. The advantages of this system are that the pipes are small and neat and may be placed in positions where the larger low-pressure pipes could not be admitted for want of space—such as behind skirtings or in narrow spaces beneath windows. They can also be used for heating apertures for the admission of fresh air in almost any position not possible for larger pipes. The heat by this system is quickly raised, in consequence of the small quantity of water it contains, and of course as quickly lowered, should the fire slacken. This system is especially suited for drying-rooms and for japanning works. It is not suited for horticultural buildings. All hot-water systems have the advantage of supplying any modified temperature that may be required to suit the varying requirements that exist during spring and autumn.

Heating by Steam.

Although this mode of heating may not, for general purposes, be preferred to heating by hot water, at the same time it is especially suited for very high buildings, where the pressure of heating by water would be too great. Heating by steam is quick in its action; at the same time, should the fire slacken the heat quickly diminishes—this is not so with the hot-water low-pressure system, where the heat is more retentive. Heating by steam is more difficult to regulate than by hot water. It, however, has one advantage—it is frost-proof; from the moment it ceases to act the pipes and radiators at once become empty. It is a very economical and useful mode of heating in factories, where the exhaust steam from the engine can be utilized. Heating by steam is very largely used in America. It has a great advantage in that it is suited for groups of buildings that may be considerably scattered or distant from the source of heat. The difference in volume between water and steam allows smaller pipes, radiators, &c. to be used in the case of the latter; consequently, it is cheaper to instal. It is important to note that 1 cub. ft. of water will produce about 1,600 cub. ft. of steam at atmospheric pressure; also, to bear in mind the important peculiarity in the quantity of heat required to produce steam—known as the *latent* heat of steam. To heat water from zero to the boiling-point at atmospheric pressure requires 212 degs. Fahr., but to convert the water from boiling-point into steam requires four to five times as much heat, although the steam will not appear to possess an increased temperature: however on its being condensed to water, this *latent* or hidden heat is given out again and renders good service in the heating of buildings. The heat of the steam is utilized for the purpose of heating by its being condensed to water in radiators. The position and size of the radiators should be carefully considered; they should be placed under windows and in other positions where the greatest amount of cool air emanates. Care should be taken that the condensed water can freely flow back to the boiler, and attention should



TRINITY U.F. CHURCH, POLLOKSHIELDS, GLASGOW. W. G. ROWAN, ARCHITECT.

be given to details, as regards air in the pipes.

Calculating the Surface of Radiators and Pipes.

In calculating the superficial area of the pipes and radiators required to heat a room or building, both for hot water and steam, it is important to take into account the area of the glass in the windows, together with the cubic capacity of the room, at the same time taking into consideration the quantity of fresh air admitted per hour, thickness and nature of the walls, &c., and whether the building is exposed or not.

Adaptations of the Systems.

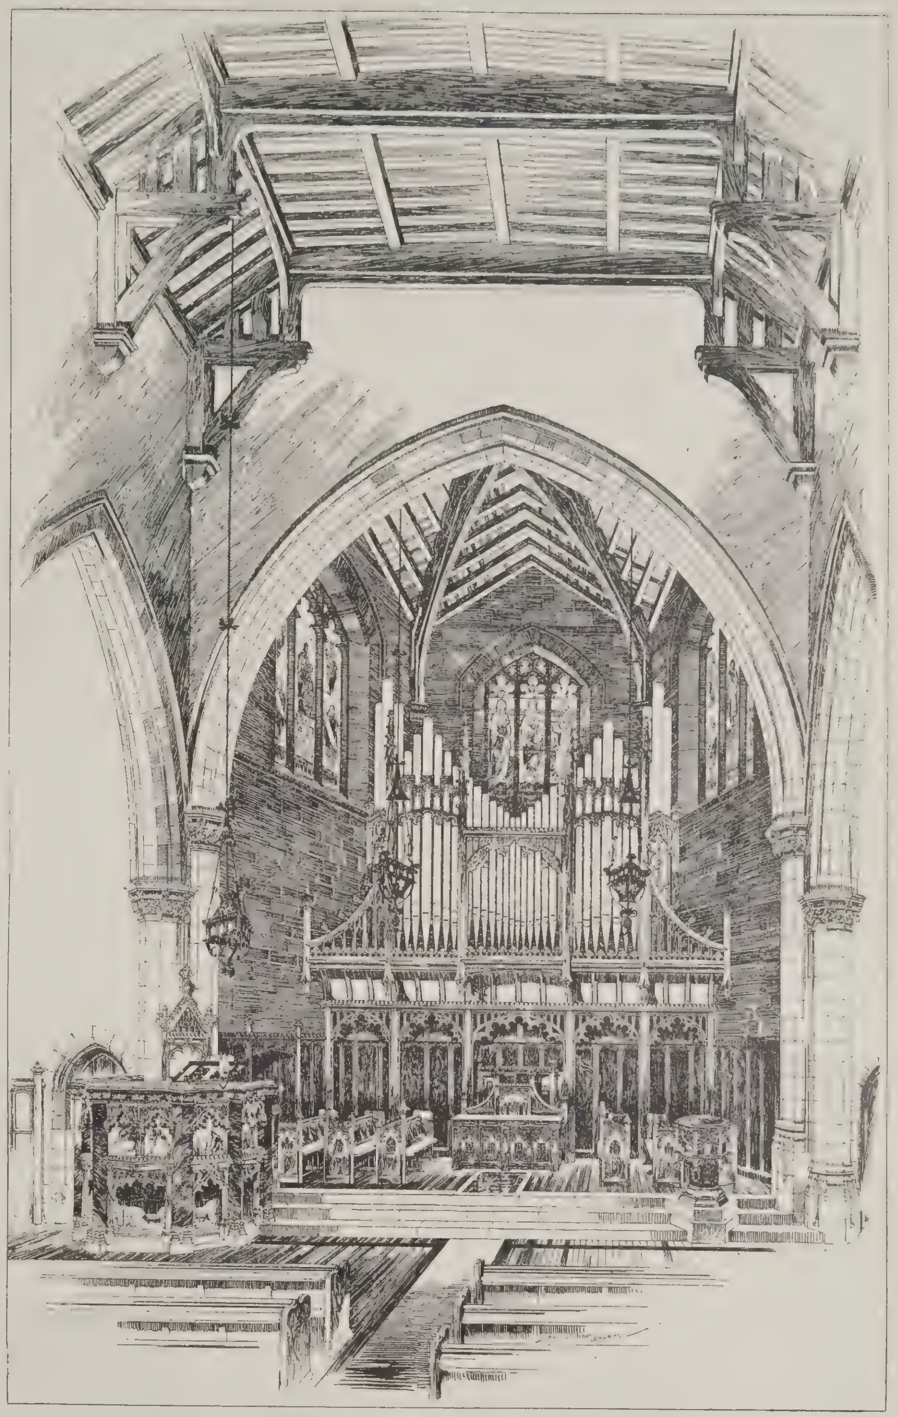
Small Rooms.—Open fireplaces of the modern slow-combustion type.

Large Rooms.—Open fireplaces having ventilating grates of the Galton type, assisted by radiators and also by coils placed in cases under the windows. Open stoves of the ventilating type might be substituted for the open grates, if preferred.

Churches, Public Halls, &c.—Hot-water, low-pressure, if practicable, employing radiators (enclosed in cases if desired) placed under windows and in other places where cool air is met. The heating of churches and similar buildings requires great care. Usually the heating is by pipes inserted in ventilated trenches, situated in the aisles, and covered by iron gratings flush with the floor. The objections to this mode of heating are—at least 20 per cent. of the heat is lost, resulting in a waste of fuel to that extent; also the open gratings admit quantities of dust and dirt which lodge on the pipes, where they become burnt and so render the air insanitary. A more economical and better arrangement would be to heat the building by *indirect* radiators placed above the floor. Some should be placed in recesses in the outer walls; flues should be formed from the recesses to the sills of the windows above for the purpose of warming the glass. The large west windows of churches would probably require two radiators of 100ft. superheating-surface each. The clearstory windows might be heated by a pipe (high-pressure) supported upon a label moulding hollowed out for the purpose. Draughts in churches and similar buildings, which are so frequently the cause of serious complaint, might be practically abolished if attention were paid to the warming of the glass of the windows, so that it practically offered the same resistance to the cooling effect of the outside air as do the solid portions of the walls of the building. Other *indirect* radiators should be placed in convenient positions so as to produce sufficient heat to satisfactorily warm the building. The hot-water high-pressure system should be employed in situations where space will not allow large pipes or radiators to be placed.

Very high buildings and those placed at a distance from the source of supply of heat should be heated by steam, as it is more economical and convenient.

The Edinburgh Architectural Association.—The Associate section of the Society held their seventh ordinary meeting on March 18th. Mr. J. Douglas Traill occupied the chair. A number of lantern slides embracing many different subjects were shown. Mr. B. S. Murphy showed a series of slides of ironwork at Bellin House, Drayton House, and some of the best block work. Mr. J. A. Arnot gave interesting notes descriptive of his slides on Oxford and modern cottages. Mr. J. Stuart Syme illustrated his remarks on Italian Renaissance with some excellent slides. Other members, including Messrs. D. Ramsey, W. Davidson, T. Y. Rutherford, James Gillespie and John Wilson, supplied interesting notes on slides representing various subjects, such as the cloister of the English Cathedral, the Fountain of Versailles, and Scotch and English ecclesiastical work. The meeting was well attended.



TRINITY U.F. CHURCH, POLLOKSHIELDS, GLASGOW.

Bricks and Mortar.

Aphorism for the Week.

Talent is that which is in a man's power; genius is that in whose power a man is.—LOWELL.

The Rhind Lectures. MR. THOMAS ROSS, architect, this year's Rhind lecturer in connection with the Society of Antiquaries of Scotland, delivered the first lecture of the course in the lecture hall of the National Portrait Gallery, Edinburgh, on March 23rd. The subject of the course is "Secular buildings erected in Scotland from the earliest period to the seventeenth century." The examples, said the lecturer, for the very early part of the subject are necessarily incomplete and fragmentary. There are probably no remains of pre-Roman dwelling-houses in Scotland, but there is evidence of great tomb structures, and the opinion is probably well founded that these latter are a reflex of the houses; and although the dwelling-houses have thus perished, it is quite possible and highly probable that they survive in modern instances in remote places. The earliest surviving type of human habitation built of stone is probably the "bee-hive" house, of which there are several examples in the western islands. They are of small size, 7ft. or 8ft. in diameter, and of a height sufficient to stand upright within, access being obtained by creeping in by the small doorway. The principle of their construction is good; it is practically the same as that of the mediæval spire, so that these houses were likely to be enduring. Existing remains may thus have come down from a very early period. In the thickness of the walls useful recesses and even small chambers were sometimes constructed, and an example of an early house from the Long Island shows a group of what may be called twelve bee-hive houses grouped together, some of which look like single-roomed houses, and others apparently of a larger size. Another remarkable group in the Bay of Skaill, Orkney, consists of a number of rooms or cells, knit on to what seems a common passage, and

ST. MARGARET'S CHURCH, TOLLCROSS, GLASGOW.

a modification of this exists at Stanabreck, North Ronaldsay; while at Howmae, in the same locality, there is a most complicated plan of what appears to have been two houses with some separate cells, a workshop, and two places for cattle, about thirteen places in all, of the most complicated and irregular plan one could well imagine. These houses have all a uniform construction, built on the surface of the ground, and with stones without lime or cement, and having converging walls and roofs of stone slabs. Maeshewe, one of the largest chambered tombs, has the great covering mound. The interior is a Greek cross on plan, with a small cell in three limbs and the long entrance passage in the fourth limb. The internal angles of the cross are composed each of a single stone of great size. These assist in supporting the roof, which is formed by overlapping courses. Maeshowe is a building of considerable architectural merit. The lecturer concluded with a brief reference to the underground houses found scattered over the area of Scotland, principally in the eastern side.

St. Bartholomew-the-Great. Mr. E. A. Webb, F.S.A., recently delivered a lecture at the ancient priory church of St. Bartholomew-the-Great, Smithfield, London, on the changes which the fabric has undergone from its foundation by Rahere to the present time. Mr. Webb dealt with Rahere's life in Rome, and the vision during his convalescence from fever which led to his return to England and the establishment of the church and hospital "in the suburbs in Smithfield." The Norman church was the work of Rahere; the transepts, the crossing, and the first bay of the nave, showing ornaments of the Transition period, were begun by Prior Thomas. The original nave, standing on what is now the graveyard, where some bases of pillars may be seen, was probably Early English. In the first decade of the fifteenth century extensive alterations were made. The Lady Chapel was rebuilt, with a crypt beneath. The original clearstory was replaced by that which now exists. About this time the tower was probably rebuilt, as the corbels of the West arch and the capitals of the Norman shafts on the North side have Perpendicular mouldings. To this period belong the tabernacle work and panels of the founder's tomb. Successive priors altered and modified the buildings; the oriel window in the centre arch of the Norman triforium on the South door and the door in the South ambulatory were added by Bolton, who built Canonbury Towers. After the surrender to the King by Fuller, the last prior, in 1539, the nave was destroyed, the present West front built, and the Lady Chapel and the conventual buildings sold to Sir Richard Rich. According to a document recently discovered in the Record Office by Mr. Webb, early in the seventeenth century, the Lady Chapel was used as a dwelling-house. It was afterwards occupied as a fringe factory till 1885. The church was of very great interest, showing, as no other church in London did, the various architectural periods; and the restoration (commenced in 1863) partly from designs by Mr. Aston Webb, A.R.A., had been carried out successfully. No one could mistake the new work for old; but the new harmonised extremely well in colour and style with the original. The special object of the lecture was to awaken interest in the recovery and restoration of three bays of the ancient cloisters, which are all that are known to remain. These adjoin the South wall, so that access could be gained therefrom through the original Norman entrance now walled up. These arches are of the fifteenth century, in a fair state of preservation, and their acquisition is very desirable. The other parts of the cloisters have been demolished to make room for, or been incorporated in, secular buildings.

German Municipal Exhibition. THE German Towns Exhibition will be held at Dresden from May 20th to the end of September next. The objects of the exhibition are—(*a*) to show the condition of German towns at the beginning of the twentieth century, especially the development of the larger German communities in the last ten years, and the progress made in the various branches of local administration in that period; (*b*) to exhibit the productions of German manufacturers for the use of the local administrations. In the towns division there will be formed groups, namely:—(i.) Communications, lighting, street-making, drainage, bridges, and harbours, including all underground construction and surveying, tramways, &c.; (ii.) town extension, control over building and dwellings; (iii.) art matters (architecture, painting, sculpture, &c.); (iv.) public health and welfare; (v.) schools and education; (vi.) poor law, hospitals, charity; (vii.) finance, rates, industrial undertakings belonging to towns, ground ownership, savings banks and pawnbroking; (viii.) registration and office arrangements, public employees, statistics and literature. Some towns and firms will exhibit portions of streets of natural size showing all that is over and all that is under the surface, such as surface-water drains, other drains, wires, water and gas pipes, &c. In the other division about 300 of the most important German firms have already announced their participation.

R.I.B.A.

FIRE-PREVENTION.

A MEETING of the Royal Institute of British Architects was held on Monday evening last at 9, Conduit Street, W., the chair being occupied by Mr. John Slater.

Mr. Horatio Porter, A.R.I.B.A., read a paper on "Fire-Prevention."

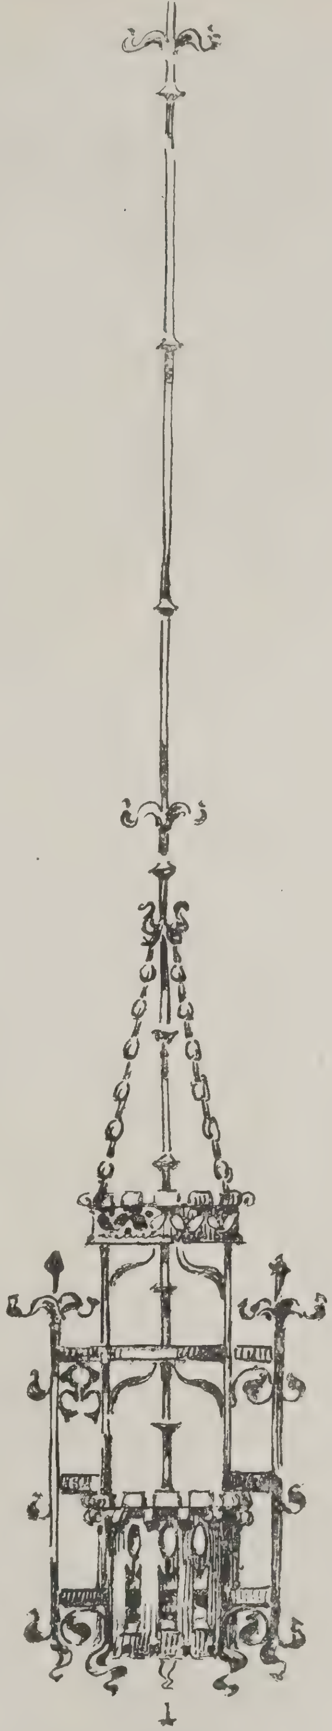
After referring to the fire risks of defective hearths and flues, joinery, &c., he went on to speak of building materials. Mr. Porter said:—Good brickwork is no doubt best for fire-resistance. The chemical composition of the clay is the great element in determining both the fire-resisting and weight-carrying properties of a brick, which depend chiefly on the proportions of silica and alumina in the clay, and, secondly, on the oxide of iron, lime, magnesia, potash, &c. Terra-cotta used for structural purposes may be porous or hard-burnt. The porous is made by the addition of some combustible material, such as sawdust or finely-chopped straw, to the pure clay, which is then burnt under great heat. By this means the straw or sawdust is consumed, leaving the clay in a porous state. Hard-burned terra-cotta is made from pure clay without the addition of any combustible substance. The porous form is non-conductive of heat, but does not carry weight so well as the solid; and if the straw or sawdust has not been thoroughly burnt out of it there is danger of disintegration under the combined effects of fire and water. The hard-burned terra-cotta has to depend greatly on the hollow spaces with which the blocks are moulded, and is liable to crack on being suddenly cooled. For the protection of girders or columns, where it has little or no weight to carry, the porous form seems the best.

Discussing the fire-resisting qualities of mortar, plaster and cement, Mr. Porter referred to a series of tests with cement-mortars carried out in Chicago in 1896. From these it was deduced that concrete floors might after a fire-test hang together under heavy loads, but they are nevertheless weakened—to what extent depends upon the duration of the heat. Cement-mortar can hardly be relied upon to resist high temperatures satisfactorily. Common lime and sand-mortar in small quantities has probably greater fire-resisting properties than any other plastic material, and would be a better protection than cement-mortar if it were strong enough to be used to a thickness of, say, 4in. or more.

As regards concrete, tests have been made by which the material has been subjected to as much as 1,976 degs. Fahr. for several hours, and allowed to cool slowly, and also suddenly by application of water. The concrete composed of sand, gravel or stone mixture crumbled, or gave signs of great weakness, while that composed of cinders showed good coherence and did not suffer by wetting while hot. The highest degree of coherence was found in a mixture of 1 part cement to 7 of coarse cinders. The conclusion is that where concrete has been made with care and knowledge it will bear very high temperature for a long time, even with the application of cold water.

Wrought-iron, cast-iron and steel, although non-inflammable, are not good fire-resisting materials, and must be cased in some fireproof covering. Unprotected iron may not itself suffer by fire, but its expansion under great heat may cause serious damage to the building. Steel will expand 1in. in 125ft. for every 100 degs. Fahr.

Combustible materials for the fitting up of buildings should be used as sparingly as possible. Shelves might in many cases be made of wire-netting supported on metal uprights; counters might be constructed on the principle of fireproof doors and shutters. The use of wood, however, cannot be eliminated altogether. Careful tests seem to prove that wood can be so treated as to be made efficiently fire-resisting, that the treatment does not injure it for structural purposes, and that its effect is permanent. But the process adds about 30 per cent. to the cost of joinery in soft woods; hence it is too expensive at present for general use.



PULPIT LIGHT FOR CATHCART U.F. CHURCH.
W. G. ROWAN, ARCHITECT.

The author went on to consider the treatment necessary for the different purposes for which well-holes are required—dealing first with well-holes and light shafts; secondly, with well-holes for stairs and lift enclosures. The use of wire-glass in iron frames for skylights in well-holes is desirable, as it helps to prevent the fire from bursting through from below or burning embers falling in from above. Wire-glass withstands not only great heat but also the sudden cooling when water is poured upon it. It is not only admirably suited for skylights, but also for warehouse windows overlooking narrow well-holes or streets.

Judged from the standpoint of fire-resisting design, the usual position of staircases and lift shafts in mercantile offices and hotels is wholly wrong. Such well-holes should be enclosed by fire-resisting walls, with access to large floors or corridors by doorways only, which could be fitted with fire-resisting doors. The walls enclosing well-holes should be carried through and above the roof in the same manner as party-walls, and the skylights over should be of thick plate-glass, or preferably wire-glass. Extra fireproof doors for stairs and elevator openings are recommended. To check the rush of flame up a shaft a system of automatic sprinklers might be fitted round the sides of the opening near the roof, or perforated pipes in connection with an outside standpipe would serve the purpose. A staircase made of oak or teak, with 2in. treads and risers and soffits, and the spandrels filled in solid with some hard wood, the author thought, would be found the most reliable.

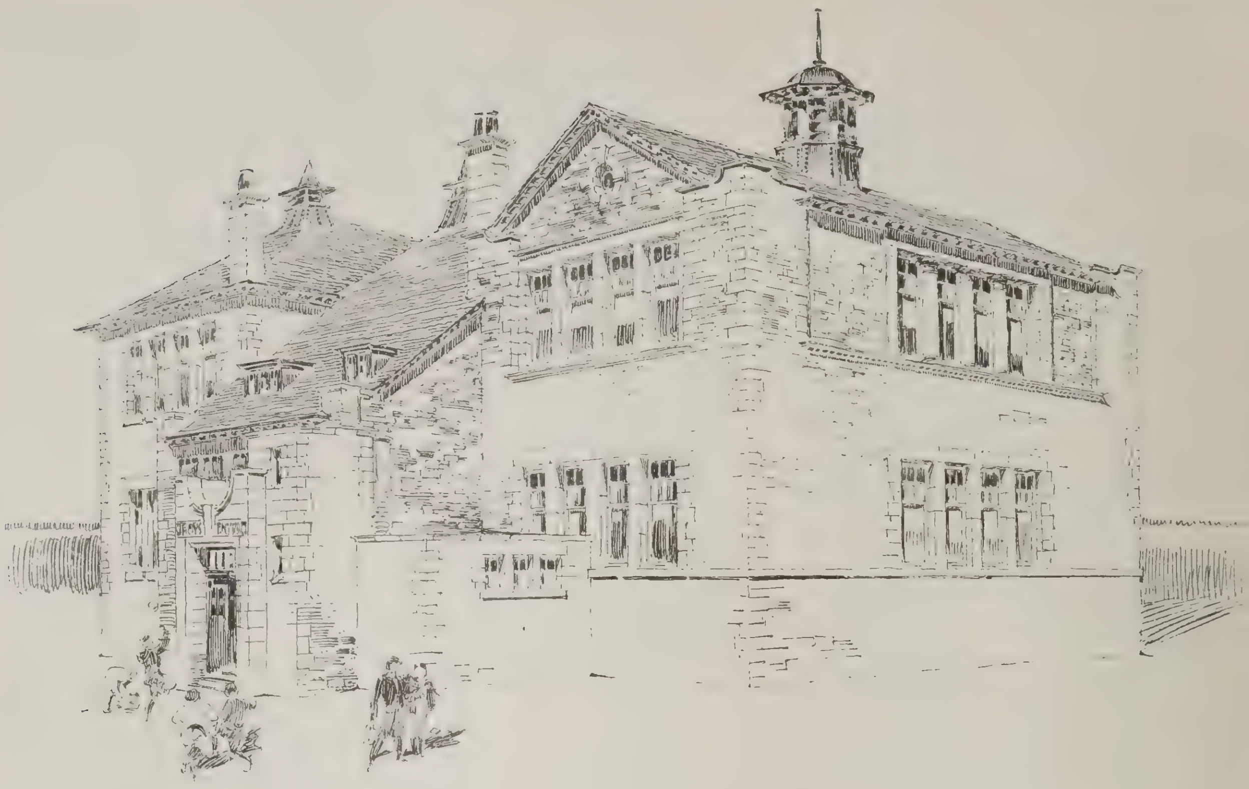
Fire-resisting floors the author classed as (1) concrete, (2) terra-cotta or brick. Some half-dozen exceedingly severe tests have been made of concrete floors, and not one of the floors failed. Experimental tests show that hollow tile arches, of good design and not too long span, have a strength sufficient to be safe under any load likely to be brought upon them in any ordinary building; also that their resistance to fire is entirely satisfactory, except that the dense tile is likely to go to pieces if struck by a stream of water when heated.

A satisfactory fire-resisting covering for columns and girders may be of plaster, concrete, brick or terra-cotta. Metal lathing should only be used where plaster is adopted for the covering material, and the column should be first wrapped with asbestos lining bound with wire.

The author next described the best forms of fire-resisting partitions. It is most important that terra-cotta partitions should start directly upon the masonry of the floor, and the terra-cotta blocks should be of sufficient width to secure stability.

In conclusion, M . Porter suggested giving as a subject for a students' competition the designing of a hotel, retail store or mercantile house, on fire-resisting principles, having special regard to internal effect in the first two cases and in the third to economy of space.

A discussion followed in which Mr. Searles-Wood, Mr. Thomas Blashill, Mr. Mead (of the Sun Fire Office), Mr. Lewis Solomon, Mr. Henry Lovegrove, Mr. Lewis Bax, Mr. Max Clarke and Mr. Slater took part. Our report of it, for want of space, is held over till next week.



BUSBY PUBLIC SCHOOL. W. G. ROWAN, ARCHITECT.

Builders' Notes.

The Sheffield Master-Builders' Association held their first annual dinner on Thursday last, the chair being occupied by the president, Mr. A. J. Forsdike.

Hibernian House, Dublin, has recently been fitted with improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool.

The General Hospital, Jersey, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester grates and stoves.

A new Slag Brickworks is to be established close to Messrs. Walker Maynard & Co.'s Coatham Iron Works, Redcar, from which the slag will be obtained. It is expected the new concern will give employment to about fifty men.

Shipping Marks on Timber.—The 1903 edition of the excellent "List of Shipping Marks on Timber," published by "The Timber Trades Journal," has just been issued. It has been considerably enlarged, numerous maps of districts from which timber is obtained being included, and lists of shippers (with marks and descriptions of the timber rough and worked which they supply) who have recently come into the market. Lists of shippers, &c., of timber from Sweden, Norway, Finland, Russia, Germany, Austria, Canada and the United States are given. To the timber merchant or the large contractor the book is invaluable and a necessity. The price is the low one of 6s. in cloth and 7s. 6d. in leather. It is published by Messrs. William Rider & Son, Ltd., of 164, Aldersgate Street, E.C.

A Use for Slate Waste.—For many years past the question of how to deal with slate waste and refuse from the quarries has been exercising the minds of quarry proprietors. Some years ago an attempt was made by the officials of the Penrhyn quarry to deal with the trouble, but it did not succeed. A Carnarvon man, Mr. Vincent Groom, now claims to have discovered a secret whereby the waste can be transferred into profitable commercial articles. By pulverising the slate refuse into dust and the use of certain chemicals, the waste can be turned into blocks of stone that will, it is claimed, stand a pressure of 100 tons to an inch more than any other.

A new Sanitary Material.—Mr. William E. Farrer, engineer and sanitary specialist, of 36, Cannon Street, Birmingham, has recently fixed at the Oxford Circus underground convenience a sample stall of "Torfit," the new material for urinals, where it is now on trial as arranged with the Sanitary Institute.

"Torfit" is a specially prepared, highly d
infectant composition, upon contact wi
which urine immediately becomes innocuo
thus preventing the insanitary and noxic
smells usually inseparable from urinals.
is formed in slabs of suitable size for urir
backs, ends, divisions, channel and flo
treads, which take the place of earthenwa
slate, &c. "Torfit" urinals, in addition
being comparatively economical in first co
it is claimed, effect an enormous saving
cost of water for flushing purposes.

Law Cases.

Glasgow Building Regulations Act : Base- nents under Streets.—Some time ago Mr. R. V. Forsyth applied to the Dean of Guild for uthority to make alterations in his ware- ouse at the corner of Renfield Street and ordon Street, Glasgow, and in particular to nlarge the basement flat by building under enfield Lane to its centre, up to which his ight of property extends. Mr. Stuart Cran- tone, the proprietor on the opposite side of enfield Lane, consented. The Master of Vorks lodged objections on the ground (1) hat the consent of the Corporation was equired, under section 20 of the Building egulations Act, to any building under the ane (which is a private street within the neaning of the Police Acts); and (2), under ection 65, to the increase of the cubical xtent of the warehouse, which already ex- eeds the limit under the Act. The Dean of uild on June 23rd last repelled the objec- ions of the Master of Works and granted he lining. The Master of Works appealed o the Court of Session, and on March oth the Court gave its decision, upholding he Dean's decision on the first point—the ight to go under the lane without the Cor- oration's consent—but reversing it on the he second point, and refusing the lining ntil the consent of the Corporation was obained. No expenses were found due to either arty.—The Lord President in the course of is judgment said it did not appear under hat conditions the municipal authorities ere entitled to insist (if they could insist) on aying pipes or other things under a street, ut in so far as section 20 was concerned, it id not place an embargo upon the owner of round extending to the middle of the street om putting his property under the level of to all ordinary and lawful uses. As to the cond question, it was admitted that the fect of the operations proposed would be to dd 6,700 cub. ft. to the petitioner's building, as to make its total cubical extent about 96,700 cub. ft. It was thus clear that if the uilding which the petitioner desired autho- ty to erect were a new one he would first eed to obtain the consent of the Corpora- on, as his present building was nearly twice e cubical extent authorised by section 65. he petitioner argued that section 65 did not pply because it had reference to new struc- res, not to additions to existing buildings hich were already more than 350,000 cub. ft. extent. It was true that the section did ot in terms provide for a case like the esent, but the Lord President was disposed think that where the building already tended to more than 350,000 cub. ft. no dition to its cubical area or contents uld be made without the consent of the orporation.

Underpinning a House: Damages for ettlement.—At the Birmingham assizes on arch 23rd the case of *Higginbotham* v. *arsons and Martin* was heard. This was an tion for damages for trespass. The trespass leged consisted in the defendant erecting a use by the side of a house of the plaintiff's, derpinning the wall of plaintiff's house, d causing a serious settlement. For the aintiff, it was stated that he built four uses in Weatheroak Road, Sparkhill. e last of the series adjoined a piece of land ich the defendant acquired, and on which commenced to build a house: he came ht up to the plaintiff's house, dug down the purpose of making cellars, under- nned the wall, and caused it to settle and ck. The defence was that what had been ne was lawful and done in such a way at the plaintiff had no right to complain; at in building the house the defendent ployed a contractor; that there was no cessity and no expectation that the con- ctor would do underpinning; that the defendant received no intimation of it, and, therefore, the person liable was the contractor, and not the defendant.—Plaintiff's counsel pointed out that in the plans under which the contract was taken, underpinning was contemplated. He contended also that it was the duty of the defendant to see that the contractor whom he employed should not do any injury to the adjoining property. Evidence for the plaintiff was given to the effect that the underpinning was not properly carried out. Red bricks instead of blue bricks were used, and common mortar instead of cement; the three top courses were laid dry, and the top course was laid in brick ends for the plaintiff's footings to rest on. For the defence it was stated that there was no real necessity to underpin, but it was discovered that the plaintiff had trespassed by his footings about 4½in. on to their building land, and they had to do what was done in order to get a vertical line to build up to. If the plaintiff's property had not been there there would have been no necessity to underpin.—His Lordship said there was no doubt that the underpinning was badly done. He gave judgment for the plaintiff against Parsons for £35. The action against Martin would be dismissed.

Claim for Unsatisfactory Work.—In the King's Bench Division of the High Court judgment was recently given in an action by Mr. Stanley Broadbent, of Leicester, against Messrs. T. & W. Meadows, builders' contractors, of Heaton Norris, Stockport, claiming £200 odd, balance due for work done and goods supplied. His Lordship said it appeared that defendants had entered into a contract for the erection of some buildings at a sanatorium at Baguley, and they employed the plaintiffs as sub-contractors to do the slating and tiling work. The defendants said that the work which the plaintiffs had contracted to do was not completed to the satisfaction of the architect, and that if there was any money due to plaintiffs, which they denied, the sum of £105 was sufficient. The agreement between the parties was clear, that the plaintiffs were to be bound by the architect's certificate, and, therefore, on the legal rights the plaintiffs were only entitled to £105, though he regretted he could not give them more. Judgment, therefore, for the plaintiffs for that amount.

COMPETITIVE DESIGN FOR JUNIPER GREEN CHURCH. W. G. ROWAN, ARCHITECT.

The Ancient Church of Ickford, Bucks, is proposed to be restored.

A new Workhouse Infirmary for the West Ham Union has been opened at Leytonstone. It occupies a site of close upon 23 acres, has taken three years to build, and has cost £250,000 to build and furnish it. It accommodates nearly 700 patients. The staff will number over 200.

Keystones.

Safety of Roman Monuments.—Signor Nasi stated in the Italian senate last week that the monuments of the Palatine were not in danger; they only required a few minor repairs, which would be executed without delay.

Memorial to Journalists.—Mr. W. Goscomb John, A.R.A., has consented to become the art adviser of the Committee of the Institute of Journalists appointed to make arrangements for the memorial in St. Paul's Cathedral to war correspondents who lost their lives in South Africa.

A new Hotel in London, known as the "Kenilworth," has been erected at the corner of Great Russell Street and Bloomsbury Street. It has nearly 300 rooms and accommodation for over 350 persons. It is built with red-brick facings and Portland-stone dressings. The entrance porch is built in white and grey Italian granite.

A Night Refuge for Females has been erected in Watergate, Perth, from designs by Mr. David Smart. The contractors were:—Mason, Mr. Alexander Beveridge; joiner, Mr. M'Quibban; plumber, Messrs. Frew, Watson & Co.; plasterer, Mr. M'Ritchie; slater, Mr. Taylor; painter, Mr. Mackay; electric lighting and blinds, Mr. Campbell.

Buried Cities of Ceylon.—Mr. Edward Ames recently read at the Camera Club a paper dealing with the buried cities of Ceylon. In the year 1817 an Englishman was hunting big game in what he believed to be the primeval forests of Ceylon, when he was suddenly confronted with the evidence of a highly educated civilisation in the character of a ruined temple. Prior to that date the Singalese had preserved the secret of their former greatness from Europeans, although Moors and Portuguese must have known of the existence of these ancient cities long ere this. Since then, discoveries of great interest have been made, until to-day abundant evidence of great cities and magnificent buildings is presented, offering full proof of the authenticity of the ancient history of those cities, the records of which exist.

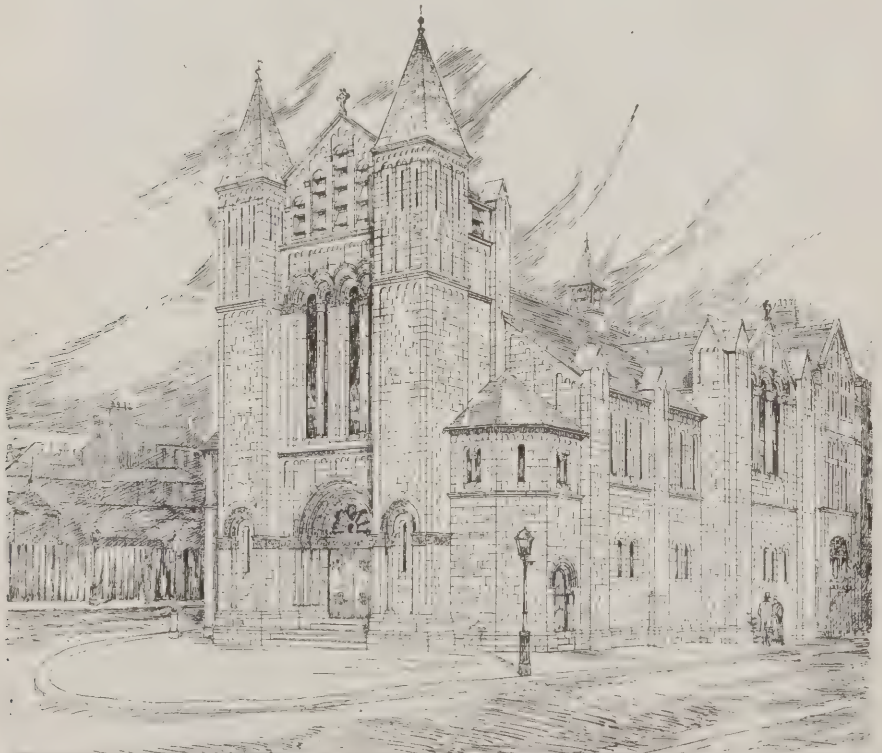
Shepherd's Hall, Chorley.—Twenty-two designs were received in this competition. Mr. Dyson, of Horwick, won the £10 premium.

Lady Sanitary Inspectors.—Kensington was the first public authority to appoint ladies to inspect workshops, and since then many others have followed their example. The credit of the reform belongs to Dr. T. Orme Dudfield, who still remains the medical officer of health for Kensington.

Supervision of House Design in South Kensington.—The Secretary to the Treasury in reply to a question in the House of Commons as to whether the Board of Works had any jurisdiction over the houses about to be built north of the footpath in Church Street, Kensington, so as to ensure architectural uniformity and good taste, said that the condition for letting provided for the erection of the houses according to designs to be approved by the Commissioners of Woods.

The Memorial to Lord Dufferin which is to be erected on the Donegal Square West site at the new City Hall in Dublin has been designed by Mr. F. W. Pomeroy, and will cost £5,000. The architectural setting of the figures will be in Portland stone on Classic lines, consisting of a canopy supported by four Ionic columns standing on a massive base showing four panel faces, on two of which will be seated bronze figures of India and Canada. Above the canopy will be a small dome on which a bronze figure of Fame will stand.

A new Presbyterian Church at Muswell Hill has been opened. It is Perpendicular Gothic in style, and is faced externally with whole white flints in combination with best pressed red facing bricks and red terra-cotta dressings. The interior is finished with sand-faced stucco. The seating is circular on plan, all radiating from the pulpit, which has a spacious platform in front of it. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C. The builders were Messrs. W. Johnson & Co., Ltd., Belle Vue Road, Wandsworth Common, S.W.



THE WYND CHURCH, GLASGOW. MCKISSACK AND ROWAN, ARCHITECTS.

Mr. A. Edward Thompson, architect, of Withernsea, is preparing plans for the new riding school, stables, recreation-rooms, offices, &c., to be built at Hull for the East Riding Imperial Yeomanry.

A new Roman Catholic Church in the Mile End Road, E., has been erected from designs by Mr. Frederick A. Walters, F.S.A., of Westminster. It is in Gothic style, of red bricks with Ancaster stone dressings, &c.

A Church Competition.—The competition recently held for the Baptist Church, Beverley Road, Hull, has been decided in favour of designs submitted by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, architects, 5, Clement's Inn, Strand, London, W.C.

In the Crypt of St. Paul's Cathedral, on one of the piers just west of the sarcophagus of the Duke of Wellington, there has been fixed a memorial tablet by Mr. J. N. Forsyth, the sculptor, in memory of the late Sir Samuel Browne, V.C. The memorial is of pure white marble, and is carved in low relief with a figure of a Punjaub cavalryman, who holds a scroll bearing an inscription. It is intended to set up a replica of the memorial in Lahore Cathedral.

Durban Municipal Buildings Competition.—Twenty-seven competitive designs have been received for the Durban Town Hall, Library, Museum and Art Gallery. Thirteen have been sent in from South African architects and fourteen from home competitors. Six are being selected by an assessor (Mr. W. E. Robarts, president of the Institute of Natal Architects), and the final competition will be limited to these. The premiums of £500 will be awarded for the first and £300 and £200 for the second and third, with £100 each to the other three competitors.

Competition Reform Society.—The committee of this Society disapproves of the existing conditions of the competition for a free library at Maidenhead because the Council retain to themselves the right to erect a building in accordance with any one of the three premiated designs they may select; also the clause as to cost is unsatisfactory. The Society, therefore, requests its members to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised.

The Church of St. Giles Without, Cripplegate, Fore Street, E.C., has been exposed by reason of the City Corporation, in widening the street, having recently pulled down the Quest House and four shops, of date about 1660, which stood in Fore Street between it and the north side of the church, and hid the church from view. The opportunity presents itself for acquiring the piece of land, which will otherwise be sold for building purposes. It is desirable that the whole of the north side of the church should remain open to the street, and that the north wall and windows, now blocked, should be suitably restored. The requisite outlay is about £9,000, towards which about £2,000 is promised.

Liverpool Architectural Society.—In the annual report for the past session, just issued, reference is made to the Liverpool Corporation and its competition for workmen's dwellings. The Council resents the setting aside of the designs submitted, in favour of the city surveyor's plans. Considerable attention has been given to the schedule of charges, originally published in 1870 and revised in 1890; it is hoped the edition now being published will prove useful and satisfactory. The honorary secretaries remind senior members that applications are constantly being made by draughtsmen wanting situations, though very few architects apply for the names of likely assistants. The present membership of the Society is 154. The statement of account shows a balance in hand of £36 2s. 2½d.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Buildings to Measure at Plymouth.

PLYMOUTH.—PROBATIONER writes: "Kindly mention any Early English or Decorated work in or near Plymouth suitable for measuring as a testimony of study for the R.I B.A. Intermediate Examination."

There is Early English work at Plymstock, Yealmpton and Buckfastleigh. The first two of these are close to Plymouth, and should both be visited for the purpose of selection.

G. A. T. M.

Sewage Treatment.

DORSET. — BACTERIA writes: "Kindly recommend a book giving the pros and cons of the treatment of sewage by the septic tank system."

See "Specification, No. 5," published at these offices, price 5s. nett.

R.I.B.A. Examinations.

SIDMOUTH.—DOWN SOUTH writes: "Where can I obtain the syllabus of the R.I.B.A. examinations; also, what books should I require for the preliminary examination?"

All the information you require is contained in the R.I.B.A. Kalendar, which can be obtained from No. 9, Conduit Street, W., price 2s. 6d.

The Architectural Association.

TWICKENHAM.—H. writes: "How might I join the Architectural Association?"

Communicate with the secretary, Mr. D. G. Driver, 56, Great Marlborough Street, W.

Quantity Surveying, Mensuration and Book-keeping.

QUANTITY writes: "(1) Have any articles on quantity surveying appeared in THE BUILDERS' JOURNAL? (2) Can you recommend any books for mensuration and book-keeping as required for the Surveyors' Institution examinations?"

(1) No. See the notes on the preparation of bills of quantities in "Specification, No. 6." (2) Hunter's "Self-Instruction in Book-keeping" and "Progressive Exercises," price 2s. and 1s. 6d. respectively (Longmans & Co.); Stevens's "Elementary Mensuration," 3s. 6d. (Macmillan & Co., Ltd.).

Classic and Mediaeval Ornament.

HULL.—A. G. writes: "Can I obtain large plates of Mediæval and Classic ornament suitable to draw out for the R.I.B.A. Intermediate Examination?"

For Classic ornament see Spiers's "Orders" and H. D'Espouy's "Classic Ornament"; for Gothic see A. Pugin's "Specimens; Examples; Normandy" and J. K. Colling's "Details."

Books on Water Towers.

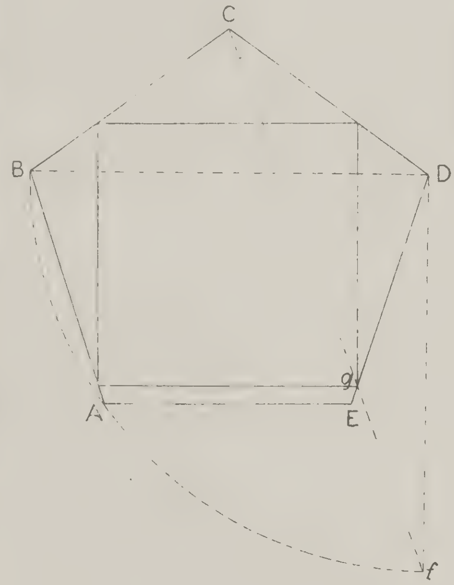
LONDON, N.W.—B. E. A. writes: "Are there any books on the construction of water towers?"

"The Water Supply of Towns and the Construction of Waterworks," a practical treatise for the use of engineers and students of engineering, by W. K. Burton, A.M.I.C.E., Professor of Sanitary Engineering in the Imperial University, Tokyo, Japan, and Consulting Engineer to the Tokyo Waterworks (price 21s., post free); "Towers and Tanks for Waterworks," the theory and practice of their design and construction, by J. N. Hazlehurst, Member of the American Society of Civil Engineers (price 10s. 6d. nett, post free); "Waterworks Distribution," a practical guide to the laying-out of systems of distributing mains for the supply of water to cities and towns, by J. A. McPherson, A.M.I.C.E. (price 6s. nett). These books can be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C.

Examination in Elementary Mathematics.

SHEFFIELD.—A. F. F. writes: "Which are the best books for the geometrical portion of the Board of Education's examinations in elementary mathematics (Honours, Part I.)? The syllabus requires problems in pure geometry, and those also which require the application of algebra or trigonometry. Could you spare room for a solution of the following question (from a recent paper)?—Show how to construct a square so that its vertices shall lie on four of the sides of a regular pentagon."

The best book for the geometrical portion of this examination is probably Casey's "Sequel to Euclid" (Dublin University Press). The construction of the problem submitted is shown by the accompanying sketch. Draw the given regular pentagon A B C D E, whose sides are 1·176 times the radius of circumscribed circle; join B D and set up D*f* at right angles and equal to B D; join C*f* crossing E D at *g*, which will be one vertex of the square required.



HENRY ADAMS.

S.K. Examinations in Building Construction.

HERNE BAY.—S. H. H. writes: "What is the date of the next examination in building construction under the Science and Art Department, South Kensington, and which is the nearest centre to here?"

The examination in building construction will be on Saturday, May 9th next, from 6 p.m. to 10 p.m. It would appear from IX., page 23, "Supplementary Regulations for Secondary Day Schools and for Evening Classes" (price 4d.), that it is now too late to make application. Application for examination should have been made to "the special local secretary (where one has been appointed) or to the correspondent of the managers of a school where examinations are to be held, by March 18th for admission to the evening and by April 28th for admission to the day examinations." There is no day examination in building construction. If it is intended to have a school, to be recognized by the Board, at Herne Bay in time for 1904, steps should be taken to enable Form 125 being filled up and forwarded before September 30th (or other date which may be substituted for September 30th). We advise you to procure a copy of the "Regulations" quoted from above; it may be had from Messrs. Eyre & Spottiswoode, or through any bookseller. External candidates, such as your students, are charged a fee of 2s. 6d. each. Any secretary of an existing school in, say, Canterbury will explain in ten minutes' conversation the steps to be taken to set up a school which surely Herne Bay ought to have.

Building Surveyors.

CHAGFORD.—E. G. S. writes: "(1) Where can I obtain information about the examination for building surveyors? (2) Are the posts of sanitary and building surveyors generally combined? (3) What is the average salary of a building surveyor?"

(1) An examination for building surveyors to local authorities is held by the Royal Institute of British Architects, particulars of which are obtainable from the secretary, 9, Conduit Street, Hanover Square, W. It does not seem, however, to have any very great value, as exceedingly few surveyors think it worth their while to enter for it. Probably the entrance examination of the Incorporated Association of Municipal and County Engineers, 11, Victoria Street, S.W., would be more to the purpose. (2) In small places they are usually combined. In larger towns the borough surveyor often acts as building surveyor, and it is only in the largest cities that the building surveyor is a separate official. (3) This varies from a nominal fee to several hundred pounds a year, it being impossible to state an average.

G. A. T. M.

Obstruction of Light.

LANCASHIRE.—LEEP writes: "A friend of mine owns two dwelling-houses on a highway, and desires to know whether he can claim compensation from the adjoining church trustees for obstructing the light. The church was commenced about a year ago, and has so darkened the rooms of the adjoining houses that one of the tenants has given the landlord notice to quit. Has the owner of the property good grounds for a claim?"

This is a matter about which a local solicitor should be consulted, provided that the lights were in existence for nineteen years and a day before they were first interfered with. The fact that the tenant has given notice to quit (if this be genuine and not a mere arrangement) is evidence of damage; but the distance at which the church is erected is suggestive that the amount of light cut off cannot be great. A judge would probably want to know also why an injunction against the building was not sought at an earlier stage. The case is consequently a doubtful one, and the result would depend largely upon the judge before whom it was heard.

G. A. T. M.

Half-Timber Work.

RAINHAM.—STUDENT writes: "In building houses to represent the old black-and-white half-timber houses, should the timbers be framed and backed with 9in. brickwork or framed in thin oak and nailed to the face of the brickwork? What section should the oak framing be?"

Sham half-timber work is most reprehensible; if the wall is of bricks it will be stronger if built entirely of them. If the local by-laws allow real half-timber to be used with plaster panels, or in 4½in. brickwork, with vertical tiling on the front on battens or tiling alone, it has of course the advantage of cheapness. The oak looks best when left from the adze and should not be stained or coloured. The plaster filling is best flush with the face, though it is often left ½in. back from the face of the beams. For further information see "Specification, No. 6," a reply to an enquiry with illustration of a half-timber house in course of construction on p. 286 of our issue for June 14th, 1899, and an article by Mr. W. A. Melton which appeared in our issues for December 15th and 22nd, 1897.

MODERN LONDON BUILDINGS.

(*Continued from* p. 89, *No.* 424.)

Having received numerous enquiries on the subject, we thought it useful to have a list compiled of the principal buildings erected in London during the last twenty-five years. In compiling this list the Editors have met with much difficulty. The pages of this and other technical journals have been consulted and put largely under contribution, and our thanks are tendered to our contemporaries for the large amount of information which was thus obtained. Still, inaccuracies and omissions must be inevitable in such an undertaking, and we should be much obliged to any of our readers who would kindly write to us with corrections and additions. As far as it is possible to do so the buildings are dealt with in districts, and, as will be seen, are gathered together under the respective years when they were erected. The list of public and semi-public buildings in the E.C. district was published in our last issue.

E.C. DISTRICT: DOMESTIC BUILDINGS.

Building.	Architect.	Approximate Cost.	Remarks.
1876.		£	
No. 1, Poultry	J. & J. Belcher	—	
1878.			
Queen Anne Chambers, Holborn Viaduct.	W. Leckham Witherington.	—	The building is of red brick and Dumfries and Bath stone.
1884.			
Artisans' Dwellings, Brown's Estate, William Street, Blackfriars.	W. Hewson Lees	—	The dwellings are built of stock bricks, with red-brick cornices, strings, &c.
Vicarage House (of St. Bride's, Fleet Street), Bridewell Place.	Basil Champneys	—	The vicarage has a frontage of 44ft. and a height of 48ft. The style is a mixture of Elizabethan and Queen Anne. The facings are of red brick; gauged brickwork being used for carving and ornament.
1885.			
Artisans' Dwellings, Seward Street, St. Luke's.	Marshal N. Inman	33,125	The foundations of the buildings are carried down to a depth of 20ft. The buildings themselves consist of one-, two- and three-room tenements, which afford accommodation for about 1,500 persons.
City and Central Dwellings Co.'s Workmen's Dwellings, Seward Street, Goswell Road.	Marshal N. Inman	48,000	The building consists of eight blocks, each giving accommodation to about forty-eight families, or a total accommodation of nearly 1,400.
1898.			
Headmaster's House, Merchant Taylors' Schools, Rutland Place, Charterhouse Square.	W. Hilton Nash	—	The materials used for the house were Portland stone, Monk's Park stone and red bricks. The reception-rooms are on the ground floor, and there are nine bedrooms on the upper floors. The house communicates with the boys' dining- and luncheon-rooms.

E.C. DISTRICT: RELIGIOUS BUILDINGS.

Building.	Architect.	Approximate Cost.	Remarks.
1875.			
Church of the English Martyrs, Tower Hill.	Welby Pugin	10,000	The stonework is of Cooper Hill stone, except in the caps and bases, which are of yellow Mansfield stone, the columns being of Aberdeen red and Bessborough grey granite. The exterior is of Box Ground Bath stone and brick. The style is the English Gothic contemporary with Flamboyant.
1876.			
St. Mary Aldermary, Bow Lane, Queen Victoria Street (alterations).	Tress & Innes	12,000	
Welsh Chapel, Bridgewater Square, Barbican.	Charles Bell	5,000	Accommodation is provided on the ground floor and in galleries for 650 persons. The walls are of brick, with Kentish rag facings and Portland-stone dressings. The spire, 90ft. high, is slated, and the style is Early Gothic.
London Mission House, New Broad Street (additions).	E. C. Robins	12,000	The additions are in the Italian style, harmonizing with the existing buildings erected forty years earlier by Sir William Pite.
1879.			
St. Sepulchre's Church, Snow Hill (restoration).	Newman & Billing	15,000	
1880.			
Wesleyan Chapel, City Road (partly rebuilt).	Charles Bell	5,000	
1882.			
St. Clement's Church, Bath Street, City Road.	William Butterfield	—	The entire length of the church is 135ft., of which the chancel takes up 41ft., the width of both being 28ft. The walls are of grey stocks externally and red brick internally, with Bath-stone dressings.
Welsh Wesleyan Chapel, City Road.	Wilson, Son & Aldwinckle.	9,000	
1890.			
Billingsgate Christian Mission, St. Mary-at-Hill.	George Baines	4,025	The mission hall, on the first floor, is constructed to seat about 200 persons. A retiring-room leads into the hall, and over this room is a library with brick window at angle. The ground-floor and basement comprise two large rooms each 37ft. by 19ft., which are leased to the Postal authorities. The exterior is faced with red Bracknell bricks, with Ancaster-stone dressings, and red glazed brick pilasters to the ground-floor storey.
Mission Hall (for St. Paul's Church, Clerkenwell), 85, Goswell Road.	Henry Ough	—	The elevation is of red brick with terra-cotta dressings. The basement contains lavatories, stores and kitchens.
1891.			
St. Bartholomew-the-Great, Smithfield (new south transept).	Aston Webb	—	The external facing is of flint with Portland-stone dressings, and the internal facings are of Bath stone.
Mission House, Shoreditch, E.C.	R. J. Lovell	—	The house contains a mission hall and several rooms for classes, while a series of bathrooms for poor women and children are provided. Besides bedroom accommodation for the ladies in residence, there are a refectory and private rooms, and also a soup kitchen.
1903.			
The Leysian Mission Buildings, City Road. (In course of erection.)	Bradshaw & Gass	100,000	On the lower floors are complete suites of club rooms for working men, lads and girls, with a large gymnasium and drill hall for boys' brigade, &c. The small hall will seat about 600, and has a complete suite of twenty-five classrooms of various sizes attached to it. The roof of the small hall is a flat, to serve as an open-air preaching and concert garden. The great hall holds about 2,000 persons, in connection with which are various retiring-rooms. On the third and fourth floors are situated the Leysian and Moulton House settlements. On the upper floor is a small settlement for lady workers and accommodation for the missioner. On each side of the central entrance shops are arranged, each with basement storage. The first and second floors over the shops are formed into twenty-seven offices. Polished granite pilasters are used in the lower part, the whole of the upper part being of bright red terra-cotta. The buildings will be completed in 1904, the foundation-stone having been laid in 1901.

E.C. DISTRICT: COLLEGES AND SCHOOLS.

Building.	Architect.	Approximate Cost.	Remarks.
1875.		£	
Merchant Taylors' Schools, Charterhouse (extension).	Edward I'Anson	50,000	
St. Paul's Cathedral Choir School, Carter Lane.	F. C. Penrose	13,260	The school is 148ft. long by 40ft. wide, and is of brick with terra-cotta dressings, the spandrels, &c., being executed in sgraffitto ornament.
1879.			
Board School, Graystoke Place, Fetter Lane.	E. R. Robson	6,859	Accommodation is provided for 436 children.
1882.			
City of London School, Victoria Embankment.	Davis & Emanuel	76,000	The building has a frontage of 132ft. to the Embankment, and the main buildings occupy an area of 18,000ft., in addition to gymnasium and fives-courts. The classrooms are on the ground, first and second floors. The large dining-hall in the basement measures 50ft. by 32ft. by 16ft. high, and accommodates 600 scholars. The walls of the basement are lined with cream-glazed bricks. The entrance on the ground floor gives access to a vestibule 34ft. by 32ft. In the "teaching block" are eight classrooms, each 24ft. by 22ft., to hold forty boys. On the ground floor are masters' sitting-rooms. The great hall, 100ft. by 45ft., runs the whole length of the building on the ground floor towards the Embankment. The hall is 84ft. high to the ridge, which is surmounted by a flèche. On the second floor of the "teaching block" are laboratories, lecture-theatre, kitchens, &c., and a lecture hall 58ft. by 48ft. The façade is Renaissance in style, executed in Portland stone carved by Mr. Gilbert Seale.
1883.			
Birkbeck Institution, Bream's Buildings.	Fowler & Hill	—	The building is 80ft. high, and contains library, reading- and coffee-rooms, and a lecture-room 66ft. by 50ft., to seat 1,200 persons. The walls are of red brick, with stone dressings and mullioned windows.
Finsbury Technical College, Tabernacle Row, City Road.	E. N. Clifton	—	The building is of brickwork with stone dressings. The upper floors contain class- and lecture-rooms to accommodate 200 persons, and on the ground floor are laboratories.
1885.			
Guildhall School of Music, Victoria Embankment.	Sir Horace Jones	20,000	The building is Italian Renaissance in style, executed in Portland stone, and comprises four floors containing 42 classrooms. In the basement is a common-room for professors, refreshment-rooms, &c., while on the second floor is the practice-room, measuring 70ft. by 28ft.
1886.			
Finsbury and Shoreditch Polytechnic, Appold Street, Finsbury Square, E.C.	H. W. Dobb	8,000	The elevation of the building is in the Tudor style. In the basement are a swimming-bath and a gymnasium. On the ground floor are a concert-hall 66ft. by 40ft., games-room, drawing-room and refreshment-room. On the first floor are the workshops and classrooms, and a flat roof 120ft. by 70ft. gives space for open-air concerts, &c.
Zion College, Thames Embankment.	Sir A. W. Blomfield	26,000	The building, which is in the Perpendicular style, is 75ft. high, and has a 75ft. frontage to the Embankment and a return frontage of 134ft. On the ground floor is a hall 63ft. by 30ft., also a book- and court-room. On the upper floor is a library, whilst the mezzanine floor contains luncheon- and book-rooms.
1887.			
City of London College, White Street, Moorfields.	E. A. B. Crockett	16,000	The building is in the Gothic style, executed in red brick and Portland stone. The basement contains the great hall, 70ft. long by 40ft. wide and 27ft high. The ground floor contains the reading-room, 53ft. long by 20ft. wide, with a coffee-room adjoining, a library, office, board-room and principal classroom 44ft. by 20ft. On the other floors are more classrooms, including studios, laboratories, &c., giving total accommodation for about 400 students.
1891.			
Bishopsgate Girls' School, Bishopsgate.	T. Chatfeild Clarke	18,000	Accommodation is provided for 550 pupils, together with all the requirements of a middle-class girls' school. The materials used are Lawrence's red bricks with buff terra-cotta dressings. The architecture is based on the collegiate buildings of the Jacobean period.
1893.			
St. Bride Foundation Institute, Bride Lane.	- - - -	18,000	The building has a frontage of 107ft. with a return frontage of 34ft. and an average depth of 75ft. It consists of five floors, including the basement. The swimming bath, 75ft. by 27ft., and washing baths occupy part of the basement and ground floor. The remainder of the basement is taken up by book stores, laundry, lavatories, strong-rooms, &c. On the remaining portion of the ground floor are the library and gymnasium, 48ft. by 23ft. On the first floor is the executive department, board-room and offices, and a reading-room 50ft. by 27ft.; also a lithographic printing school of 1,500 sq. ft. area. On the mezzanine floor in front are the Passmore Edwards and Blades libraries, and the printing museum. On the floor above are the letterpress printing school, 70ft. by 33ft., a girls' reading-room and caretaker's apartments. The frontages are faced with red brickwork, with Portland stone and terra-cotta dressings. The floors are fireproof in construction, and the staircases are of stone.
Science School for the Merchant Taylors' Company, Charterhouse Square.	W. Hilton Nash	4,000	The ground floor contains classrooms and physical classrooms, and the upper floor contains a lofty laboratory with open-timber roof, storerooms, &c. The buildings are faced with red brick and Monk's Park stone bands and window dressings.
1894.			
Additional Wing, Central Foundation Schools, Cowper Street.	T. & H. Chatfeild Clarke.	3,500	This building is of three storeys, with one room on each floor. The ground floor is mostly left open for light and access to the basement, the front wall being supported on Portland-stone columns and arches. On this floor is a room suitable for an office. On the first and second floors are placed physical and chemical laboratories respectively. These are lofty rooms about 33ft. square; they are heated by hot water at a low pressure. The street elevation is of Suffolk bricks and Mansfield stone, with an arcade of Portland stone on the ground floor.
City of London School for Girls, Carmelite Street, Victoria Embankment.	Andrew Murray, City Surveyor.	16,000	In the basement, cloakrooms, lavatories and recreation-room are provided. On the ground floor are an entrance hall, lady-principal's room, secretary's office and two classrooms. The two floors above have five classrooms each, and the third floor has four classrooms. On the fourth floor is a luncheon-room, 70ft. by 28ft. 6in. and 16ft. high, with kitchen, &c. On the attic floor are rooms for the housekeeper. The buildings adjoin the Guildhall School of Music, and have a frontage of 71½ft. and a depth of 51½ft. Accommodation is provided for 250 girls. The elevation to the street is in Anglo-Italian style, the material used being Portland stone.
Mercers' Schools, Barnard's Inn, Holborn.	T Chatfeild Clarke	-	The area of the site is 27,000 ft. super. The old Inn Hall still stands and is incorporated in the school buildings, which are faced with red brick and Ancaster-stone dressings. There are two entrances to the main block, one of which is surmounted by a clock tower. The old hall is used as the dining-room, and kitchens, &c., have been built adjoining it; and the headmaster's room is near it. In the main block on the ground floor is the large assembly hall, 70ft. by 40ft. On the same floor are lecture-room, laboratory, &c. On the first and second floors are classrooms, six on each floor, warmed by low-pressure hot water. A separate building, facing Fetter Lane, contains the chemical laboratory and the drawing school. The buildings are fireproof throughout, and are lighted by electricity. The classrooms accommodate 300 boys. The lavatories form a separate building in the playground.
1897.			
Guildhall School of Music, Victoria Embankment (extension).	Andrew Murray, City Surveyor.	20,500	The building has a frontage to John Carpenter Street of 72ft. 6in. and a depth of 51ft. 6in., the area of the entire site being about 3,700ft. The accommodation provided consists of, on the ground-floor level an orchestral saloon 47ft. wide and 55ft. long, with a stage 47ft. wide by 13ft. deep. The height of the saloon is about 30ft., and it will accommodate 650 persons. On the second, third and fourth floors are thirty classrooms. The basement is occupied by dressing-rooms, &c. The floors are fire-resisting throughout. The elevation, which is 22ft. higher than the older buildings, is faced with Portland stone, rising from a granite plinth.
1898.			
Cripplegate Institute, Golden Lane.	Sidney R. J. Smith, together with F. Hammond.	30,000	The general facing of the building is Fareham brick, with Portland-stone dressings. It contains reading-rooms lending library, boys' room, concert hall, ward offices, committee-room, refreshment-rooms, technical instruction and classrooms, and residence for caretaker.
The Sir John Cass Technical Institute Jewry Street, Aldgate.	Arthur W. Cooksey	30,000	The basement provides for the various technical workshops, the physical laboratory, the lower part of the lecture-theatre and the necessary accommodation for the lighting and heating apparatus. Upon the ground floor is the large hall. The remainder of the floor provides rooms for the governors and secretary, the enquiry office, and the upper part of the lecture theatre. The first floor comprises the upper part of the large hall and classrooms. The second and third floors provide rooms for refreshments and social purposes, art and science schools, laundry and tailoring departments. The top floor consists of a large gymnasium, 74ft. by 36ft., and two playgrounds for the use of the school children. The building is of fireproof construction throughout, and is faced with red bricks and Portland stone.

Correspondence.

Architecture in Lancashire.

To the Editor of THE BUILDERS' JOURNAL.

SOUTHPORT.

SIR,—I had hoped that someone more competent than myself would have further replied to the enquiries concerning work worth measuring in Lancashire in your issue for February 25th.

In the issue for March 11th I was glad to see Mr. Eaton advising a visit to Middleton Church. May I advise "Vignola," of Southport, to visit the church at Halsall, four miles distant. There is plenty of work there that is worth measuring. The building is late Decorated and early Perpendicular, and there is a late Decorated doorway of great beauty between the chancel and the vestry which would be suitable for measurement as a R.I.B.A. testimony study. Indeed, to my own knowledge it has already on one occasion been so accepted. There is also a fine Decorated tomb on the north wall of the chancel. The church is always open.

Before going to Halsall "Vignola" might with advantage read the two articles on Halsall Church in vol. xii. (new series) of the Transactions of the Historic Society of Lancashire and Cheshire, which he will find in the Southport Reference Library.

While admitting that Lancashire is not well off as regards ecclesiastical architecture, I think it is going too far to represent the county as absolutely devoid of any architecture worth a student's while to measure, as "G. A. T. M." has lately on two occasions led your readers to believe. Lancashire churches are nearly all Perpendicular, and not the best of that, but in many of them there are particular features well worth more than a passing notice. In the "County Index" at the end of the seventh edition of Rickman's "Gothic Architecture" there is a list of twenty-one churches given as "good examples" in Lancashire. With the exception of the Norman Chapel of Stydd, near Ribchester, they are all Perpendicular.

As far as regards R.I.B.A. testimony studies, we may be situated in an unfortunate district, but there is plenty for students to measure if they will be content with something less than the best. "Vignola" might do worse than measure some of the old work at Ormskirk Church—the Norman arch in the north chancel wall, for instance, or the tombs in the Derby chapel. He could also find much to measure at Sefton Church, of which he will find a full account in Mr. Caröe's book on "Sefton." I should also suggest he turned over the pages of Canon Atkinson's edition of Glynne's "Notes on the Churches of Lancashire," issued in 1893 as vol. 27 (new series) of the Chetham Society's publications. Both these books he will find in the Southport Reference Library.

Manchester Cathedral and the Chetham Hospital are worth visiting. The early sixteenth-century stalls and the Derby chapel screen in the cathedral are particularly worth attention.

Mr. Eaton's article on Ordsall Hall, in your issue of January 21st, and that on "Some Lesser Lancashire Halls" on February 4th, should go to show that as regards domestic work Lancashire is not so poor architecturally as London and Oxford textbooks might lead one to suppose. It is very often quite as serviceable to a student to get to work on a small building and to study it thoroughly, even if it be a debased Perpendicular church or a Lesser Hall, as to turn him loose in a cathedral where he will be at a loss to know where to begin. At any rate, I feel strongly that students should not neglect what old work there is in their immediate neighbourhood merely because it is inferior to that further away.—Yours truly,

F. H. CHEETHAM.

Painting and Graining Oak Piers.

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—It was amusing to read on p. 76 of your issue for March 18th that an architect had directed a builder to paint and grain a couple of large oak gate piers: 9in. stuff (especially if it is English) is bound to open more or less when used out of doors, however long it may have been kept seasoning. But to putty up the shakes and paint and grain the whole is indeed alarming! The same thing was done to the window-frames of some shop fronts under the approach to St. Pancras Station. Passingly speaking, oak is *not* a desirable material for window-frames. Too often it shrinks or warps, and then good-bye to the glass! An instance occurred within my recollection at the church of St. Bartholomew at Lostwithiel in Cornwall, whose octagonal tower the late George E. Street, R.A., designated "the pre-eminent glory of Cornwall." It was, I think, in 1879 the late Joseph Clarke, F.S.A., when engaged in some necessary restoration to the general fabric, put in the framing of a fanlight over a doorway in oak. This was the actual work of a local builder. The "English" used was probably not over dry, with the inevitable result that it twisted, and as a matter of course the glazing cracked in every direction.

Painting and graining marble is only a step from similarly abusing our national wood. As all practical readers are aware, no marbles exposed to outdoor atmospheric influences retain their polish for many years in this country. I remember a building in Plymouth with large monolith columns of polished Devonshire marble on the façade. These looked remarkably well for a few years, but at length the gloss went off and the ambitious proprietor, thinking they were not showy enough, had them painted and grained, and so they stand to this day. Plymouth is one of our few towns that is practically paved with marble. The limestone is variegated, and after a shower of rain looks lovely. Kilkenny is also in some measure paved with its own marble. But the latter is black, and hence not nearly so noticeable.—Yours truly,

HARRY HEMS.

Obituary.

Mr. George Gill Ogg, of the firm of Messrs. G. Ogg & Son, builders, Bankhead, died recently at the age of twenty-four years.

The late Mr. William Holcroft, of Rufford & Co., Ltd., firebrick makers of Stourbridge, left an estate of the gross value of £277,215.

The late Mr. J. W. Drake, builder and contractor, of 123, Clapham Road, was buried last week. He was seventy-four years of age.

Mr. H. J. Boolds, architect, of Morpeth, died on March 12th at Embleton, where he had been living for the last few months. He began the practice of his profession in Morpeth in conjunction with Mr. William Hardy, of Morpeth. The partnership was not of long duration, as Mr. Hardy died in 1887. The original name of the firm, Messrs. Boolds & Hardy, was retained by the surviving partner. He did the extensive additions to Morpeth Grammar School for the accommodation of the science and art departments, the ground plan of the North Seaton Links Estate, Newbiggin-by-the-Sea, and the villas erected there. Also, the Post Office, Morpeth, the Miners' Theatre, Ashington; and numerous business premises.

A new Town Hall at Brading has been erected from plans by Mr. J. Newman, of Sandown.

Construction Notes.

Glass-cast Houses. A novelty is reported from California, namely, a house that "sparkles as if jewel-studded." The house is a wooden structure, and while the exterior is still wet with paint a mixture of sand and crushed fine-blown glass is thrown on, giving the effect of a cream sandstone forming which sparkles all over in the sun. The idea of using fine-blown glass alone for sanding on toys and small objects is an old one of course, but this adaptation is somewhat new. I should like, however, to hear of the state of that house after a year or two—how then for the sand facing? Perhaps in California the climate is drier and the atmosphere not filled with smoke, but do not let the experiment be tried in any form on this side of the seas.

Foundations. THE general principles that affect the design of foundations are simple, and yet are often neglected. The importance of this part of any structure is very great; local by-laws, of course, are so framed as to prevent cases of disaster, but the regulation width and depth of concrete footings by no means prevent settlements—as many architects seem to suppose and consequently do not take any precautions. Settlement occurs, more or less, in every building and precautions need to be taken to secure uniformity. The principles to be observed are two: distribution of the weight of the structure over a large area of bearing surface, and prevention of the escape of any of the supporting material laterally. In the former the two factors that need consideration are the resistance of the soil to compression and the superincumbent weight. Knowing these, the foundations can be varied in width so as to distribute the pressure equally, and when that is done the structure will of course settle uniformly. Upon an ordinary building site all the soil is of the same character, having the same resistance to pressure, and therefore the width of the foundation only needs to be varied according to the height of, or weights upon, the walls or piers. It occasionally happens, however (more often with a large building on an extensive site), that the subsoil or part of the site is of a different nature to that on another, and then the different resistances of these parts govern the width of the foundations as well. The usual foundations are a layer of concrete in a trench. The thickness of the layer is governed by the load it has to carry and its projection. When the load is very heavy and the ground soft (and the projection consequently wide) the thickness of concrete is saved by introducing something that will give the tensile strength required, such as steel joists or rods—or timbers may be placed under the footings. The depth of the excavated trenches will depend upon local features such as the nature of the soil, the depth to which frost penetrates, &c. The foundation bed should be horizontal unless the ground is rock, when it can be brought up in level stages by concreting. Before a large and important building is commenced, tests should be made of the resistance of the ground by loading unit areas with an equivalent weight to the structure. The second principle, of preventing the escape of the supporting material, is usually carried out by sheet-piling, with a subsoil of soft or constantly wet ground, but it comes into play in other circumstances, such as where a house is built on the side of a hill, which has to be cut in steps to give level foundations, it then being necessary to protect the soil from washing out, settling or sliding by reason of the rainwater flowing down the side of the hill. Piles are also included in this principle, being used where the escape or settlement of the subsoil cannot be prevented.

H. K. D.

FIRE INSPECTORS.

IN the course of the paper on laws, by laws and regulations for fire protection (Fothergill Prize Essay) which he read before the Society of Arts on March 11th, Mr. T. Brice Phillips quoted the following extract from the report of the Glasgow Fire Brigade for 1901:—

> Defective building construction still bulks largely in our list of causes of fires. This is an inheritance that will last for a long time. Improvement may be looked for in the stringency of the Building Regulations Act, and in the inspection and proper repair of all buildings damaged by fire from this cause. All fires arising from defective building construction are at once reported to the Master of Works, whose staff visit and instruct how restoration is to be safely carried out.

Fire inspectors, said Mr. Phillips, should be given some similar powers to those of surveyors or sanitary inspectors, and premises where fire had occurred should be brought under the operations either of special building by-laws, or it might be convenient by extending the meaning of the term "nuisances" to bring such premises under section 91 of the Public Health Act, 1875, so as to ensure that in reconstruction proper precautions are taken against a recurrence of fire. The larger boroughs should appoint their own fire inspectors, but other councils should be invested with power to unite for the purpose of such appointments. A similar power of combination by district councils is already contained in section 286 of the Public Health Act, 1875, as to the appointment of medical officers of health, and in any legislation upon the present subject the section might, with slight modification, be made applicable to the appointments now suggested. It is noticeable that a large proportion of fires are caused by defects in construction of fire-places and flues. A central statistical department could, with advantage, in such cases, keep records of whether such defects are in buildings which have come under the operation of building by-laws or not, whilst it would be the duty of fire inspectors to report on these defects and suggest remedies for the prevention of a recurrence of fires.

Coming Events.

Wednesday, April 1.

Architectural Association (Discussion Section).—Mr. A. M. Watson on "Some Unorthodox Views about Building," 7.30 p.m.

Institute of Sanitary Engineers, Ltd.—Special Council Meeting at 6 p.m.

Society of Arts.—Mr. A. C. Eborall on "Application of Polyphase Motors to the Electrical Driving of Workshops and Factories," 8 p.m.

Royal Archæological Institute.—Mr. C. E. Keyser, M.A., F.S.A., on "Swalcliffe Church, Oxfordshire." Mr. R. Garraway Rice, F.S.A., on "An Illuminated Pedigree of the De Ferrers Family made in 1612," 4 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary Meeting at 8 p.m.

Edinburgh Architectural Association.—Mr. Frank Caws, F.R.I.B.A., on "A Plain Talk on Fire-proof Floors and Construction," 8 p.m.

Thursday, April 2.

Society of Antiquaries of London.—Meeting at 8.30 p m.

Chemical Society.—Meeting at 8 p.m.

London Master Builders' Association.—Meeting of General Purposes Committee at 4 p.m.

Civil and Mechanical Engineers' Society.—Mr. Gilbert on "Design and Testing of Centrifugal Fans," 8 p.m.

Friday, April 3.

Art Workers' Guild.—Paper on "Scene Painting," 8 p.m.

Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.—Business Meeting at 8 p.m.

Institution of Junior Engineers —Mr. William Paterson on "Greasy Condensation Water as Boiler Feed." Mr. H. E. Yarrow on "Evaporative Trials of one of the Water Tube Boilers for Chilian Ironclad 'Libertad'," 8 p.m.

Architectural Association.—Mr. Banister F. Fletcher on "Palladio," 7.30 p.m.

Institution of Civil Engineers. - Students' Visit to the New River Company's Reservoirs and Pumping Statoon in course of construction at Kempton Park, at 3.30 p.m.

Saturday, April 4.

British Institute of Certified Carpenters.—Meeting at Carpenters' Hall at 6 p.m. Mr. W. Middleton on "Arches and Centering."

Glasgow and West of Scotland Technical College Scientific Society.—Annual general meeting at 7.30 p m.

Monday, April 6.

Society of Engineers.—Mr. Robert J. Thomas, M.I.C E., on "Road Maintenance and Administration," 7.30 p.m.

Liverpool Architectural Society.—Annual General Meeting. President's Closing Address by Mr. John Woolfall.

Tuesday, April 7.

Glasgow Architectural Association. — Mr. F. H. Newbury on "Ideals," 8 p.m.

Wednesday, April 8.

The Edinburgh Architectural Association (Associates' Meeting). Mr. J. D. Traill on "Woodwork of Louis XIV., XV. and XVI," 8 p m.

The Japan Society.—Mr. M. Tomkinson on "A Gossip on Japanese Art," 8.30 p.m.

Bankruptcies.

[Abbreviations: R O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver.]

During the week ending March 28th thirteen failures in the building and timber trades in England and Wales were gazetted.

J. Ashby, builder, Lowestoft. R.O. March 17th

E. Lawrence, builder, Leicester. Discharge suspended for two years, March 20th.

A. Neesom, builder, 19, Cartwright Road, Chorlton-cum-Hardy. R.O. made on a creditor's petition.

King & Wilkins, builders, Sherbrook Road, Fulham, S.W. P.E. Bankruptcy Court, May 1st, at 12.

G. Beckworth, builder, Whitwick, Leics. R.O. March 16th.

C. H. Cannon, builder, 29, Connaught Road, Ealing, W. R.O. March 20th.

F. Merredew, joinery manufacturer. Kingston-on-Thames. R.O. March 17th.

N. W. K. Godard, builder, Aldrington, Sussex. R.O. March 21st.

J. Atkinson, builder, Rodley, Leeds. P.E. Leeds C C. April 21st, at 11.

F. E. Nicholson, varnish maker, Hull. R.O. March 16th.

J. W. Radnedge, builder, Merthyr Tydfil. R.O. March 17th.

A. L. Luke, builder, Caversham. Liabilities £402; assets £247: deficiency £154.

C. Cooper & Co., stone merchants, King William Street, London, E.C. R.O. March 23rd. First meeting of creditors April 7th, at 11.

R. Roughton, builder, Wisbech St. Peter, Cambs. First meeting King's Lynn C.C. April 23rd, at 10.30. P.E. same day at 11.

G. A. Waters, builders' merchant. Dover. First meeting, O.R.'s, Canterbury, April 2nd, at 9.30. P.E. same day at 10.

E. Skilter, lately builder, Beaconsfield Road, South Tottenham, London, N. R.O. March 18th. First meeting, Bankruptcy Court, April 2nd, at 11. P.E. April 28th at 12.

S. Cooper, builder, Kingston-on-Thames and Hampton Wick. R.O. March 10th. First meeting, 24, Railway Approach, London Bridge, April 3rd, at 11.30. P.E. Kingston C.C. May 5th, at 2 30.

T. Banbury, builder, 21, Warwick Street, Rugby. Liabilities £1,729; £1,697 expected to rank for dividend; deficiency £1,219. R O. March 14th. P.E. Coventry, April 20th, at 2.30.

W. Ball, builder, Cheadle. Gross liabilities £7,386; £2,845 expected to rank for dividend; deficiency £1,086. Failure attributed to losses in building property. Adjourned P.E. held at Stoke-on-Trent on March 24th and closed.

Cadman & Son, shop-front builders and fitters, Hampstead Road, N.W. P.E. concluded March 25th The turnover for the last sixteen months of the trading was between £34,000 and £35,000, as against £41,790 for the year ended August 31st, 1901. Failure was attributed to keenness of competition and to loss on trading, stated at £5,559 since September, 1899.

New Companies.

The Sligo Sawmills and Joinery Co., Ltd., Georges Street, Sligo. Capital: £10,000 in £1 shares.

Robert Corry, Ltd., builders and contractors, University Street, Belfast. Capital: £20,000 in £1 shares.

The Carlingford Granite Co., Ltd., Carlingford, co. Louth. Capital: £5,000 in £1 shares.

J. W. Dean, Ltd., builders and contractors, 84, Paxton Road, Chiswick. Capital: £3.000 in £1 shares.

Currall, Lewis & Martin, Ltd., builders and contractors, &c, 333, Icknield Port Road, Birmingham. Capital· £30,000 in £1 shares (10,000 preference).

Bramley, Sons & Co., Ltd., dealers in ironmongery, turnery, &c., 46, Granby Street, Leicester. Capital: £15,000 in £1 shares.

A PROFITABLE BUSINESS OF YOUR OWN!

A GENUINE OPPORTUNITY.

Our organization of AUTOMATIC ADDRESSING BUREAUX, extending throughout the United Kingdom, offers a splendid opportunity of establishing, in your Town or District, a remarkably profitable business of your own, connected with a co-operative enterprise quite unique in the world. Briefly stated, our proposition is the following:—

If you will establish, in your Town or District, an ADDRESSING BUREAU, and agree to organise and conduct same on the lines upon which our own is based, we will grant you a License giving you the right to the use of our name, in addition to other valuable privileges.

Only one License will be granted in each Town or District. There will be no overlapping.

The enterprise is of FAR-REACHING UTILITY, and is based on an entirely NEW BUSINESS principle.

For full particulars write at once, mentioning this publication and enclosing stamp for reply.

THE
AUTOMATIC ADDRESSING BUREAUX, Ltd.,

Douglas & Richards,* Southampton	4,592

* Accepted. [Surveyor's estimate, £5,564.]

METAL CEMENT.

A CORRESPONDENT in the "Deutsche Bauzeitung" writes warning the readers against the use of metal cement. He says that, lately, this very convenient, useful, soluble cement has been taken up pretty freely, even by some houses of importance. It will fuse at 120 degs. C., become fluid like water, and combines easily with stonework or with iron or other metals. On cooling it hardens and is resistant like Portland cement after five days, but, he says, on holding a piece of metal cement in the hand the heat will cause it to yield a smell which betrays sulphur, which constitutes the fusing element of the composition. Now it has been ascertained that sulphur will ultimately ruin iron as well as the hardest stone. If damp or air gets to it decomposition works very quickly, and even if it is kept away from both decomposition will take place, though a longer time will be required. It forms iron sulphide. No such metal packing has yet been found in old building work. On the other hand machinery foundations, garden railings, or such like constructions have been known, on being taken up after three years, to have the iron parts thinned down as though they had fused.

The writer of the letter adds, by way of conclusion, that the directors of the Baden State Railways have forbidden the use of metal cement in connection with their work.

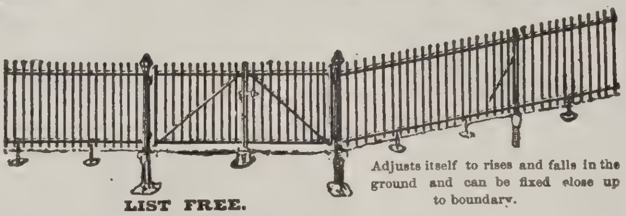
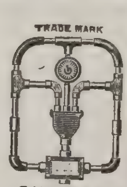
No. 2750. Round Bar RAILING.
Is, we believe, the Cheapest Railing in the Market.
Can be had with Sharp Points without extra charge.



LIST FREE.
Adjusts itself to rises and falls in the ground and can be fixed close up to boundary.



Simplex Conduits.
The "Simplex Steel Conduit System" is now recognised by all the leading authorities to be the **best method** of installing Electric Wires. It is now almost **exclusively employed** for all kinds of installation work.
ECONOMY and EFFICIENCY
are secured by the use of Simplex. Do not be satisfied with imitations. Every Conduit and Fitting stamped "Simplex."
We are devoting a big factory and all our energies to the bringing out of one product, and it is owing to this concentration of all our efforts that our system to-day stands in the **very front rank** of wiring systems.

April 8, 1903. Vol. 17, No. 426. 9, East Harding Street, E. C.

Wood in City Buildings. With the advent of concrete and iron construction, and of steelwork protected with a terra-cotta or similar casing, wood came to be regarded as an undesirable and dangerous material for City buildings: then, after several great fires in so-called "fire-proof" structures, people looked back to wood as affording perhaps the best fire-resisting construction after all: finally we are arriving at the true estimate, which, so far as human life is concerned, puts concrete and metal construction in a far higher category than wood. A floor built up of hardwood planks might perhaps be more fire-resisting than any other, better able to withstand the shock of falling weights and the disintegrating effects of water: so that from the standpoint of saving the building itself one could wish for nothing better. In Hamburg such construction is adopted throughout. But, apart from questions of cost, there is one very grave defect with wood of all kinds when the safety of human beings is considered: it is the volume of smoke generated. There are not many fires where persons are actually burnt to death: more often they are suffocated or killed in panic caused by outbursts of smoke. So that this question of wood construction is a vital one. Our attention is more particularly drawn to it just now by the recent discussion at the Royal Institute of British Architects and the publication of a test made by the British Fire Prevention Committee with a floor of yellow fir timbers, the details of which are given on p. 113 of this issue. Over and over again firemen have given their preference for wood—"concrete, stone and iron are most dangerous when we get to work on them"—but as Mr. Max Clarke observes in the publication to which we have referred, it is now clearly established that hardwood construction, such as oak, is not conducive to the saving of life, because of the intense smoke it produces. "Steel and concrete may, in the end, be destructive, so far as the structure is concerned, but if properly protected, and perhaps even if not protected at all, they are of immense advantage, in that they do not produce direct cause of death from smoke or vapour. No amount of good planning would avail if the smoke were so dense that a person could not live through it, to get out of a building, and, equally, no amount of solidity of timber construction could be looked upon as satisfactory if the result were as above stated." This fact cannot be too much emphasized. There may be failures among the many systems of fire-proofing with concrete and steel - perfection can only be arrived at by experience—but we believe the systems to be based on the right principles and that eventually "fire-resisting" buildings will prove incomparably safer than those of the "slow-burning" type.

———

Lambeth Bridge. From a report of the Bridges Committee of the L.C.C. it appears likely that a Bill to obtain Parliamentary powers for the reconstruction of Lambeth bridge will be obtained during the next session. That a new structure is urgently needed is a matter of some notoriety; the present bridge has not for a long time been adequate in either strength or width for the traffic it was called upon to take. Built in 1861, it is of the suspension type; but though strengthened in 1888 under the supervision of Sir Benjamin Baker, it is still deficient in stability and has to be used under restrictive conditions. It was the original intention of the L.C.C. that the rebuilding of this bridge should follow the completion of Vauxhall Bridge, and the temporary bridge erected to take the traffic from the last-named was intended afterwards to perform a similar office for the sister structure at Lambeth. The difficulties of the foundations, the controversy over the numerous designs and the change of engineers are matters that have doubtless combined to prolong the re-erection of Vauxhall Bridge, but after making all allowances it is difficult to acquit the Bridges Committee of contributing to the delay by vacillation and indecision. Undoubtedly a masonry bridge is regarded by architects as more desirable than a steel one, the conditions being favourable, and beyond question a masonry bridge is more enduring and less expensive to maintain. Common-sense will therefore direct the erection of such bridges whenever possible. But there are occasions when by reason of gradients, headway required, cost, or speed in erection, a steel bridge becomes a necessity. Such a necessity is dictated, says the Bridges Committee, by the conditions governing Lambeth Bridge. The gradients are very steep, being "at present 1 in 19 and 1 in 22 on the north and 1 in 20 and 1 in 23 on the south. Under an agreement the Council could not raise the level of the centre of the road at the junction of the bridge approach with Lambeth Road and the Albert Embankment more than 3ft. 10in. above the present level, and as a result that height fixed the level of the beginning of the road over the bridge." Under the most favourable circumstances no masonry bridge could be erected with a less gradient than 1 in 25. Further, during erection it would be impossible to obtain the clear headway of 15ft. at high-water mark required by the Conservancy under the two arches on either side of the centre span. These conditions, if correctly stated, undoubtedly call for a steel structure, and we think it quite unnecessary for the Bridges Committee to state the case so apologetically. The best structure is the one that conforms to the natural conditions and limitations of its position and purpose. Architects have no objection to a steel bridge *per se*, but they demand that the design, whether for steel or masonry bridges, shall be consonant to the material employed, and in this respect the County Council have lamentably failed. If the new Lambeth Bridge is to be of steel, let it frankly appear as steel, and let all cast-iron balustrades, bad Gothic tracery, cast-iron Corinthian columns and other frippery be omitted. Let the bridge be built up of standard sections with that good, plain lattice effect which has never been equalled in this class of design; and though the foundations must be of masonry, let the abutments above the high water be of lattice steel, so that the bridge presents a light, graceful and homogeneous appearance from bank to bank. If anyone doubts the artistic effect of latticework let him compare the beautifully graceful effect of the arc-lamp standards on the L. & S.W.R. at Nine Elms Goods Station, and elsewhere, with the cast-iron abominations that the County Council have placed on the Embankment. It is something, no doubt, to ask the County Council for a reasonable design, but Parliament should be thoroughly satisfied that the design has the approval of the highest artistic experts before it is passed.

———

Apsley House. The announcement of the forthcoming sale of Apsley House—adjoining Decimus Burton's screen at Hyde Park Corner — will be read with some surprise. It was of course the national gift to the Duke of Wellington; but it has architectural interest as well, for it was originally a plain brick mansion built about 1785 from designs by the Brothers Adam. Its present Bath-stone front dates from 1828, when it was cased, the front portico and west wing (containing a gallery 90ft. long) being added at the same time by S. & B. Wyatt at a cost of £130,000. It is to be hoped that the house will not be handed over to a building syndicate, as seems probable with Devonshire House.

FIRE-RESISTING BUILDINGS.

IN 1898, after the Cripplegate fire, a conference of architects and insurance surveyors held two meetings with a view to ascertain what reduction of premium the insurance companies would allow if buildings were constructed under the following conditions: —

1. If buildings are flat-roofed, with hard fire-resting material.

2. If floors of iron and concrete, constructional ironwork covered with fire-resisting material, as required by the London County Council regulations, floors connected only by staircases, which, with the landings, to be enclosed by fire resting material, such as cement on metal core, now much used; lights in these partitions to be sheet plate. Teak or oak doors, treads and risers.

3. Similar floors, but pierced for lift, enclosing walls of brick rising through roof, and openings on each floor protected by light iron shutters.

4. Wood floors and joints pugged 4in. between joists with some fire-resisting material, pierced for stairs, constructed as in No. 2.

5. Pugged floors as above, with lift in addition, lift enclosed with fire-resisting partitions as stairs in No. 2, and with iron doors.

6. If the lighting areas or well-holes common to buildings in different occupations be carried down to the basement floors and not roofed over by skylights on the ground floor.

7. If windows in front and back wall fitted with iron sashes and frames but left without shutters.

8. If opposing windows, within, say, 20ft., are fitted with iron shutters or some fire-resisting material for blinds.

Any other heads or points which the Offices may desire to note or which are set out in existing tariffs.

At a second meeting a tariff was submitted in which a normal building with a minimum rate was given, and the rate increased to meet ten or twelve different modes of construction.

This tariff appeared to be exactly what the Science Committee of the R.I.B.A. had been endeavouring to obtain from the Offices, and they were strongly of opinion that if the insurance offices regulate their premiums on any principle whatever and agree upon a tariff among themselves, it is only fair to the insurers and their advisers that such tariff with clear definitions should be available for public use, but this was not agreed to. Since this conference some rules for standard fire-resisting buildings, dated February 1902, have been issued by the Fire Offices' Committee (see the BUILDERS' JOURNAL for January 22nd, 1902). The rules are numbered 1 and 2. No. 1 applies only to cotton mills, flax mills, woollen mills and worsted mills. No. 2 gives rules for standard fire-resisting buildings, not including those scheduled above.

After a careful consideration of these rules the Science Committee of the Royal Institute of British Architects report that it would appear they have been drawn up without reference to the London Building Act, 1894, and in several points the rules differ from the provisions of the Building Act. "It would greatly facilitate business if these rules could be made to accord with the Building Act, and if the Fire Offices' Committee would draw up a tariff which would be available by the public where the normal building should be the type allowed under the Building Act, with ten or twelve varieties of construction or arrangement, whereby the normal rate would be reduced. We recommend the Council to approach the Fire Offices' Committee, to ascertain whether they would meet a Committee of the Institute to discuss these rules and tariff, with a view to making them workable. It is the general experience that the rules as at present drawn do not encourage fire-resisting construction."

Mr. H. D. Searles-Wood referred to this matter at last week's meeting of the Institute, when a paper on "Fire-Prevention" was read by Mr. Horatio Porter, A.R.I.B.A.

Mr. Thomas Blashill, late superintending architect to the London County Council, considered that experimental tests were generally valueless because they were conducted under conditions which would never obtain in actual fires—what use was it, for example, to test materials which had been saturated with paraffin or tar? He deprecated the employment of hollow partitions and shafts because of the "fire haze" they created, which did not burst into flame until it came into contact with fresh air. He hoped we were coming to the time when there would be no wooden floors—he had constructed floors of iron and coke-breeze quite as economically. Coke-breeze, having already passed through the fire, was one of the safest materials, provided it was used in the proper proportions. Burnt ballast also was admirable.

Speaking unofficially on behalf of the Fire Offices, Mr. Mead (Sun Fire Office) said they were always ready to consider suggestions from the Institute, and the present one would be sure to receive every attention. As to incendiary fires, he said that their proportion was small, though it was possible to conduct them in a manner which covered the traces of their origin.

Mr. Lewis Solomon, F.R.I.B.A., spoke of the amicable relations which existed between architects and the Fire Offices' officials, mentioning that though the Offices did not publish any requirements they had particulars which they were willing to lend, while their surveyors were most obliging in looking at drawings and making suggestions which were very helpful. But the Offices showed a want of business tact in regard to their premiums. After the Cripplegate fire those owners who wished to rebuild their premises in a fire-resisting manner asked for a reduction in their premiums, but this was not granted. He was very much in favour of teak staircases, and said that though they might not be permissible in factories under the London Building Acts, he believed they would be a hundred times safer than some of those which satisfied the regulations. Concrete stairs, which made up nine-tenths of the new constructions in London, were far better able to resist fire than stone stairs; but teak was better.

Mr. H. Lovegrove, A.R.I.B.A., referring to sprinklers, said that when water was allowed to run from the upper floors, where a fire might have originated, it was calculated to spoil the goods on the floors below. He mentioned a friend's recommendation that the sprinklers should be 8ft., not 10ft., apart. In his opinion, good concrete stairs were the best. Stone stairs were very inferior. Coke-breeze was a first-rate material, and he thought a floor made with it stood better than one of ballast. He disapproved of armoured doors.

Mr. Lewis Banks, F.R.I.B.A., urged the necessity of armouring concrete. With a fierce fire the concrete broke through, and holes were left which allowed the flames to pass, whereas if the concrete were armoured it would hold together. The new Midland Hotel at Manchester, which was perhaps the most scientifically fire-resisting hotel erected in this country, had stairs of concrete armoured on the face and covered with marble. After much experience he had found hematite slag to be the best fire-resisting material. It took longer to set, but when set it was very much harder than Portland cement, and it withstood fire better than any other material with which he was acquainted.

Mr. Max Clarke, A.R.I.B.A., said it was permissible under the Building Acts to drive wood plugs into the walls with iron holdfasts in them, with the result that in the event of a fire the holdfasts became red hot, the wood burnt, and might set fire to skirtings, &c. There could be no such thing as a "fireproof" building. They could encase their columns and girders, but in time these would get as hot as their coverings. Firebricks of course withstood fire better than other bricks, but not so much weight could be put upon them; consequently it often became necessary to chose a medium brick. He differed with Mr. Blashill that ballast was a good material. At the Theatre Royal fire at Glasgow, where the corridors were of ballast concrete, when the water was turned on the whole of the floors fell through: whereas from the tests made by the British Fire Prevention Committee it had been found that coke-breeze concrete, though incandescent throughout, did not collapse. Cast iron was satisfactory so long as no water got near it, but when that happened it was useless. In Hamburg fireproofing with heavy timbers was adopted, an admirable system, but bolts were allowed to be passed through the timbers—a mistake, because the bolts became hot and burnt the wood for several inches around them. Though timber construction might withstand fire, it produced a vast amount of smoke, and that was a grave defect. Iron doors were useless if hung only at one point, as was permissible under the Building Acts. Slag wool he considered to be the best non-conducting and fire-resisting material, far better than asbestos.

Mr. John Slater, B.A., spoke of the extreme importance of making roofs fireproof, which might be done with concrete asphalted. It seemed strange to him that the London Building Acts should be so stringent in some matters, while allowing a building of, say, five floors to be constructed with wooden joists and no ceilings.

Temporary Hospital Buildings.

An article on this subject was published in the "Lancet" for March 25th, in which the following recommendations are made for the treatment of existing temporary buildings:—

Floors.—In order to reduce the fire risk in existing buildings of wooden construction in the first instance the floor should have the spaces between the joists filled in with some non-combustible substance such as concrete or hollow plaster slabs.

Partitions.—The lower part of the partitions at least should also be treated in the same way, as wood partitions when filled in with brick nogging and plastered are practically fire-resisting. In the case of most temporary buildings the floors will be found to be raised from the ground, the joists being carried upon brick piers. This is done partly to avoid the uneven surface of the site and also to afford ventilation. All internal wood lining must be removed and plaster slabs on metal lathing substituted; in cases where the spaces between the wood framing are not filled in as suggested the plaster slabs should have a backing of silicate cotton as a protection against both cold and fire.

Ceilings.—The wood linings should be removed and fibrous-plaster slabs on metal lining substituted. All exposed ironwork or wood tie-beams and collars should be encased in some fire-resisting material, such as asbestos.

Lighting.—All gas lights in asylums should be enclosed in locked lanterns.

Heating.—Gas stoves should stand upon a solid stone base and any adjacent woodwork should be protected by an intervening piece of very fine mesh iron-gauze. This will be found a better non-conductor of heat than the sheet iron in common use. Slow-combustion iron stoves, gill stoves, and independent gas stoves with flue pipes are open to objection. If used, care should be exercised as to over-heating, and special attention is required to see that the flue pipes are properly insulated where they pass through the roof or wall. The pipes at this point have a tendency to perish quickly. They should here pass through a second larger tube with a free air-space between them, and the outer tube should be packed with silicate cotton between it and the framing of the roof or wall. Where it passes through the roof this air-space may be utilized for extracting the vitiated air by extending the outer tube a few feet above the roof, as is often done in the case of steamships for ventilating the lower decks by means of an outer casing to the funnel. Many years ago this system was successfully applied to the Hospital for Sick Children in Great Ormond Street by a Mr. Knight. Heating by hot water is certainly safer, cleaner, and more healthy. It is much more expensive in the first instance, but more economical in maintenance. A portion of the pipe should pass through a water chamber to prevent undue dryness in the air.

A Fire Test.

Publication No. 73 of the British Fire Prevention Committee has just been issued. It deals with a floor of fir supports and oak flooring tested for two hours last October. The floor was 22ft. 3in. by 10ft. in the clear, and consisted of two 10in. by 12in. beams of yellow fir placed across the testing-hut, with four 10in. by 10in. joists notched into them at 2ft. 6in. centres, oak boards 8½in. wide and 2½in. thick being spiked on top: a 15in. by 15in. yellow fir post supported the floor in the centre. The floor was loaded with 232lbs. to the sq. ft., distributed. In four minutes smoke issued from the joint between the parapet-wall and the oak flooring. In 89 minutes flame first came through the floor. In 109 minutes a small portion of the oak flooring fell. The post, beams and joists were considerably reduced in size and charred, the post to a depth of about 1¼in. and the beams and joists about 2in. The average temperature of the fire was about 1,400 degs. Fahr.

SIR JOHN VANBRUGH.

THE concluding meeting of the session of the Leeds and Yorkshire Architectural Society was held on March 26th, Mr. Butler Wilson, F.R.I.B.A., being elected president for the third successive year. Following the election of officers, a lecture was delivered by Mr. Robert P. Oglesby on "Sir John Vanbrugh, Dramatist and Architect."

The line which divided Vanbrugh's work as a playwright and his career as an architect was clear and decided. There was, in a sense, a slight overlapping of vocations, inasmuch as his first completed architectural work was a theatre in the Haymarket. This sudden leap from the drama to architecture was taken as a glorious joke by his brother wits and litterateurs, who forthwith let loose such a flood of sarcasm and raillery upon his architectural efforts as would have crushed with ridicule any ordinary individual. A house that Vanbrugh erected for his own occupation on the site of the ruins of old Whitehall was dubbed by the wits the "Goose-pie." The first great scheme of this imaginative but unschooled architect was the design and erection of Castle Howard, Yorkshire, for the Earl of Carlisle, in 1702. His want of training was here observable on all hands, but his genius for the picturesque atoned for many defects. The Earl of Carlisle was so satisfied with the designs for Castle Howard that he created Vanbrugh Herald Clarenceux King at Arms. Walpole declared that the Mausoleum there "would almost tempt one to be buried alive."

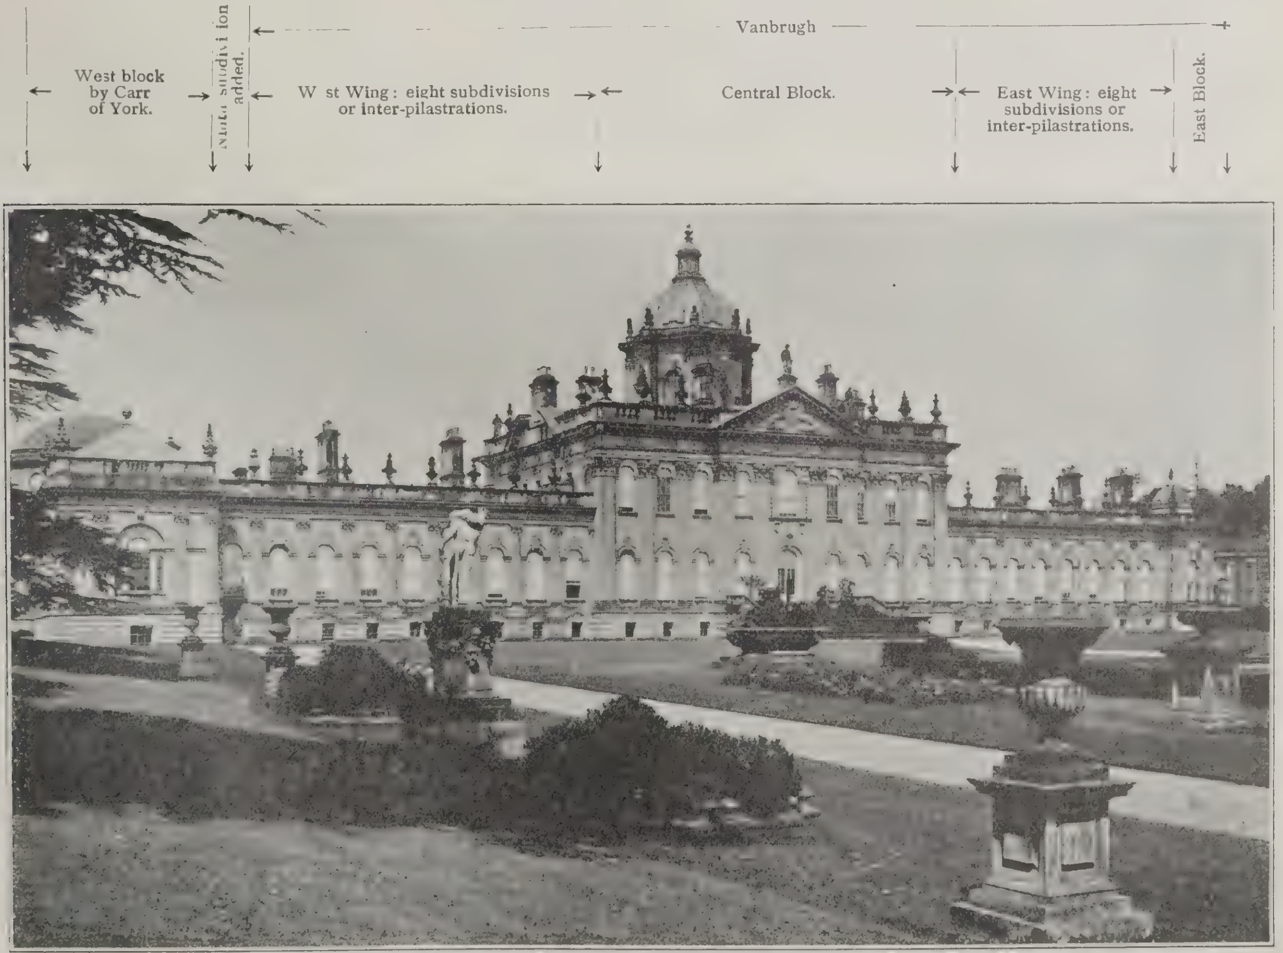
In the east wing of the south front of Castle Howard there are, contrary to classic law, an even number of sub-divisions—eight, whereas to the west wing are allotted nine such spaces. Mr. Oglesby advanced the theory that Carr, of York (the architect of Harewood House), in completing the west block, added another space, thus correcting Vanbrugh's want of training.

Among other notable buildings designed by Vanbrugh were Clarendon Building, Oxford; Seaton Delaval; King's Weston, near Bristol; Fleurs Castle, Roxburghshire; Kneller Hall, Hounslow; Grimsthorpe Lincolnshire; and Stowe, Buckinghamshire. Reserved to the last was Vanbrugh's greatest work, "Blenheim," erected by a grateful nation for that famous son of Bellona, John Churchill, first Duke of Marlborough, in commemoration of his glorious victories over her enemies. The plan of Blenheim at once stamped Vanbrugh as a man of powerful imagination, and, concluded the essayist, notwithstanding his glaring want of refinement and taste, he would, had he lived longer and studied further, have become a really great architect. His ponderous extravagances, however blamable in detail, were never contemptible in the whole; but it was this love for the ponderous in architecture that inspired Dr. Evans's witty and not inappropriate epitaph—

> Lie heavy on him, earth! for he
> Laid many heavy loads on thee.

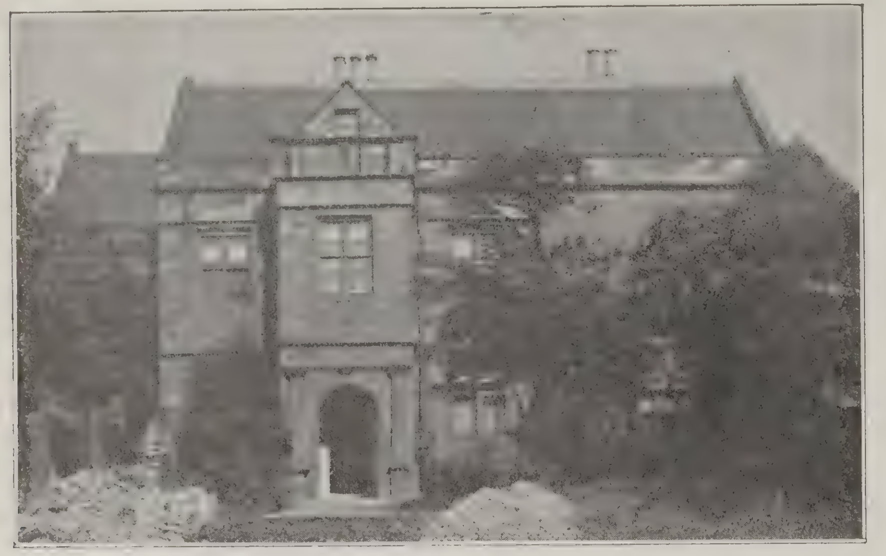
All the buildings of this unschooled architect were conceived on such a huge scale that it has been quaintly remarked that their ruins will have far greater effect on the minds of posterity owing to the additional piles which conjecture will supply in order to give meaning to the whole.

It may be mentioned that a melodrama by Mr. Oglesby, in collaboration with another gentleman, was produced last week at the Prince's Theatre, Bradford.



Vanbrugh
West block by Carr of York.
Ninth subdivision added.
West Wing: eight subdivisions or inter-pilastrations.
Central Block.
East Wing: eight subdivisions or inter-pilastrations.
East Block.

THE SOUTH FRONT OF CASTLE HOWARD, YORKS. SIR JOHN VANBRUGH ARCHITECT.



KNOSTROP HALL, NEAR LEEDS: SOUTH FRONT.

KNOSTROP HALL.

KNOWESTHORPE HALL, or, as it is more generally known, Knostrop Hall, is situated in the village of that name about two miles east of Leeds. The hall was once the home of the Baynes family, as indicated by the cross-bones over the front entrance. On one side of the building are the remains of a structure which once probably formed a handsome summer-house or porch having open arches on two sides, and to the right and left of one arch are to be seen two rudely-carved statues on pedestals. There are also indications of the former existence of two statues to the right and left of the adjacent arch. The gateway shown to a larger scale by the drawing on p. 117 has recently been pulled down; it was opposite the front entrance and made a most striking feature, of which the stone "chairs" and semicircular steps played a not unimportant part.

Correspondence.

Early English and Decorated Work in Devon and Cornwall.

To the Editor of THE BUILDERS' JOURNAL.

EXETER.

SIR,—Referring to a reply on p. 107 of your last issue relative to remains of these dates near Plymouth, it may be remarked that, outside Exon.'s unrivalled cathedral, there are practically few remains. The great wave of rebuilding that swept the two counties in the fifteenth century left hardly anything of an earlier date save Norman doorways, arcades, fonts, and chancel and tower arches. The one great and glorious example of Norman work (if we except the cathedral towers) is the noble west front (and two south-western bays) of the church of St. Germanus at St. German's (about ten miles west from Plymouth), the ancient seat of the see of Cornwall. Those who would learn much interesting matter about this church should procure "The Architectural History of St. German's, Cornwall," by the Rev. Preb. F. C. Hingeston-Randolph, M.A., the learned rector of Ringmore, published by William Pollard & Co., of Exeter (1902). The best example of Decorated work in Devon is probably the parish church of St. Andrew at Aveton-Gifford, about sixteen miles south-east of Plymouth. The great Walter de Stapeldon, bishop of Exeter (A.D. 1308-26), who transformed the Norman towers into transepts, built the rood screen, the sedilia and bishop's throne in his cathedral, and was probably responsible for the existing Decorated work in his old parish church. There is no more beautiful work of that period in England than Exeter Cathedral (fifty miles from Plymouth). For Early English work the Beer stone arcadings in the eastern ends of the north and south (internal) walls of its Lady-chapel (Bishop Marshall, A.D. 1194-1206, and Bishop Simon of Apulia, A.D. 1214-23) stand unrivalled for infinite grace and beauty. Further, the fifty miserere in the choir (one unfortunately removed thirty years ago, and now preserved in the cathedral library), by Bruere (A.D. 1224-44), are the most complete, perfect and interesting series of their period not only in this country but in the whole world.

Yours truly, HARRY HEMS.

Architecture in Lancashire.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—I am obliged to Mr. Cheetham for so kindly supplementing the information which I was able to give "Vignola" about churches in Lancashire, and should be glad if other readers would likewise assist me in the often difficult task of recommending buildings to study in certain restricted districts. Often, too, such questions as "Vignola's" come from students who have obviously resided for some time in the districts named, and I would appeal to such that they should exhaust local resources of information for themselves before writing to THE BUILDERS' JOURNAL — putting someone else to the trouble of doing what they could better and more easily do for themselves.

With Mr. Cheetham's closing remark—that in his opinion "students should not neglect what old work there is in their immediate neighbourhood merely because it is inferior to that further away"—I fear I cannot agree. The young student who is trained upon indifferent work is likely to produce indifferent work. The utmost care is therefore necessary to secure that young men should study only that which is good.—Yours truly,

G. A. T. M.

THE ARCHITECTURAL ASSOCIATION.

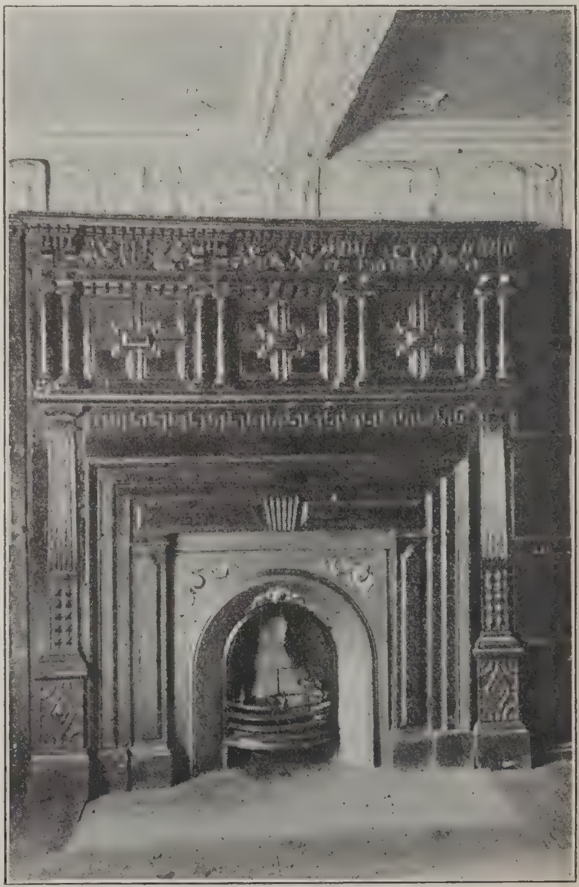
ANDREA PALLADIO.

By BANISTER F. FLETCHER.

A MEETING of the Architectural Association was held last Friday evening, Mr. Henry T. Hare presiding. Mr. Alan J. Healey having been elected a member of the association, Mr. Banister Fletcher read a paper on "Andrea Palladio: His Life and Work," of which the following is a short summary:—

Of the early life and parentage of Andrea Palladio there exists but little information. All his biographers, with the exception of Paolo Gualdo, describe him as having been born in the year 1518. The latter, however, informs us that he was born in 1508, thus making him just ten years older; but, unfortunately, there is no further confirmation of this statement.

Palladio's father, whose name was Pietro, was a mason at Vicenza, where he died in 1545. Though we should much like to know some of the circumstances of his boyhood and the various influences and episodes which contributed to his success in after years, all we are privileged to learn is from Palladio himself, for he tells us that he early possessed a great love and natural inclination for architecture, and that, as a boy, he read Cæsar's "Commentaries," and imagined and designed the bridge over the Rhine from Cæsar's written description, afterwards utilising this over the Bacchiglione, near Vicenza. Gualdo mentions that Palladio also seriously studied mathematics, which he considered an essential part of an architect's education. His humble birth is corroborated by Leoni, who describes him as of "mean extraction," adding, "that in consideration of his great abilities, and as a reward for the honours he did his native city, he was



OLD FIREPLACE IN DINING-ROOM, KNOSTROP HALL.

made free of same, and received into the body of the nobility." But this honour only came to Palladio when his fame was established throughout the whole of Northern Italy. It is evident that his early life was a studious one, and we naturally infer that a most excellent education was conferred upon him by his father, the mason Pietro, who, in all probability, sacrificed much to secure his son's future.

Palladio appears to have soon deserted sculpture for architecture, meanwhile also studying the works of Vitruvius, Alberti, Michelozzi, Cronaca, and San Gallo. It was Palladio's good fortune to be born in an age pregnant with a restless ambition to continue the work of the Renaissance; it is, therefore, not surprising to find him also fired with the prevailing spirit of his time.

Brunelleschi's great and original efforts a century before had given the necessary impetus, and had encouraged many others to follow his example. Brunelleschi was the pioneer in Florence, his greatest works being the dome of the Cathedral, Santo Spirito, and the Pitti Palace. Bramante, of Urbino, will be remembered as the designer of St. Peter's, and Peruzzi as the architect of the Villa Farnesina. Sansovino, the master of the Venetian School, built the Library of St. Mark, Venice, lately damaged by the fall of the Campanile.

In accordance with the custom of the times, Palladio possessed a patron in Gian Giorgio Trissino. It was with this patron that he first visited Rome in 1541, when he was thirty-three years of age. He must have been exceedingly industrious during this visit, as his drawings of the Classic buildings in his treatise testify. He visited also at various periods Ancona, Rimini, Naples, Capua, Pola in Istria, and Nîmes. In May, 1547, we also hear of his visiting Tivoli, Palestrina, Porto, and Albano, returning to Vicenza in July, and taking with him nine books, entitled "L'Italia liberata dai Goti." In 1551 he is for the third time in Rome, "in the company of Venetian gentlemen."

During his stay in the ancient city no doubt Palladio came often in contact with many of the great artists of the day. Here he could gaze upon the great achievements of Bramante, who died in 1514, and Raphael, who died in 1520, and could study the progress of the cupola of St. Peter under the masterly direction of Michelangelo, and see this great master's work on the Palazzi dei Conservatori on the Capitol. Here, as Angelo and San Gallo before him, he might wander to see the Laocoon which had been disinterred in the vineyard of Felis di Fredi, and was now placed in the gardens of the Vatican. Letarouilly informs us, that while Palladio was measuring here he built an altar in the long hall of the hospital of S. Spirito, the only work of his to be seen in Rome.

In Palladio's writings we find interesting information regarding the architects and painters of his day. Especially does he eulogise Vasara, whom he styles "a painter and architect of great merit." We also find mention made of Sansovino who died in 1570, accompanied by much praise of the buildings erected by him. Other contemporaries are mentioned, amongst these being San Micheli, the great military architect of the Renaissance, whose special work is evidenced in his fortresses and palaces at Verona.

We have no information regarding Palladio's marriage, neither do we find any mention made of his wife. He had a family of four sons and one daughter. The eldest son, Marc Antonio, became a sculptor, like his father; we find him living at Venice in 1588, and he died in 1600. Leonidas, who assisted his father, died about 1574. We read of his directing the building of the dome at Montagnana in 1566. Orazio, the third son, studied law in Padoa in 1564 and died in 1574. Silla, the youngest, was an architect, and assisted by Scamozzi, completed the Teatro Olimpico, upon which his father was engaged at the time of his death, and died about 1627. Zenobia married Dell Fede, a goldsmith, whose name appears inscribed in the guild of goldsmiths at Vicenza.

Before the year 1564 Palladio was in legal documents called "of Vicenza" and "inhabitant of Vicenza." In those relating to the marriage of his daughter he appears as "civis Vicentine," a distinction worthy of mentioning in the days of the Republic.

None of the honours conferred on Palladio can exceed the publication of his works, which was undertaken with much courage and diligence by Ottavio Bertotti Scamozzi, who measured, drew and restored his buildings. This book contains most interesting engravings and commentaries, showing much learning and scholarship. It embraces four large volumes, of which many editions have appeared both in Italian and French.

KNOSTROP HALL: REMAINS OF PORCH.

Though infirm for a long time, Palladio nevertheless continued to take an active part in the building of his edifices, and when the end came it found him at work upon his final effort, the Teatro Olimpico.

Palladio's death was a great grief and loss to his loyal native city, which revered him not only for his genius, but for his many other virtues—for he was both amiable and benevolent, and beloved by those under him.

His principles are best exemplified in his buildings, but a striking point about many of them lies in the fact that he was not slavishly bound by his own rules as to the proportions of the classical columns and their entablatures. Like many another, he was an exemplar of the saying that a genius can be above rules. Although he refers in detail to the various parts of a building and their proportions, he has left no information as to the design and composition of structures as a whole.

It has been held that he was specially in favour of obtaining size and dignity in his composition by including two storeys of his façades within one order. This has been said to have influenced English architecture in contrast with the precepts of Vignola which were followed in France; but Palladio employed both methods equally, while he was also fond of marking his ground storey with rusticated blocks of masonry, expressing his first floor (piano nobile) by an order, and his upper (or attic) story by flat pilasters. He also employed the attic storey, seldom used by other masters, in lieu of a great crowning cornice.

His style has been defined as a mean between the severe use of ancient forms and the licentious style of those who reject all rule whatever.

Speaking generally, the plans of his buildings were suitable to the requirements of the Venetian nobility for whom they were erected. The fact that they are not well suited to our present requirements cannot detract from their stateliness and convenience when considered in relation to the age in which they were erected, and the climate of Italy. The disposition and proportion of his apartments in regard to each other are often exceedingly happy and effective. Some have found fault with the magnificence and display which are observed in some of his façades, but here, again, we must remember for whom and with what purpose they were built. His clients were Venetian noblemen, eager to display their power and position by the erection of grandiose buildings, which he provided in his spacious columned vestibules, grand staircases, galleries, libraries and colonnades.

Palladio's architecture was essentially columnar and not fenestral, and his entablatures were proportioned to the column with which they were associated, whereas his predecessor, Sansovino, occasionally employed an entablature disproportionate to the columns as at St. Mark's Library, in which windows are placed in a deep frieze. In addition to the methods referred to, Palladio frequently used two orders of different scale in the same facade; one comprising the whole height of the building and the smaller subordinate "order" being only one-half or two-thirds of the larger one.

Columns were sometimes placed on pedestals in order to give additional height, sometimes not so. The pedestals never seem to have been decorated with panels, sunk or raised, although this feature is so treated in Palladio's book. Fluting is generally omitted from the columns as designed by Palladio, and this was probably due to the fact that they were frequently formed of brick and stucco, materials which were unsuitable for fluting in long lengths.

Palladio's knowledge of the details of ancient Roman architecture was extraordinary, yet his inventive genius was considerable, and we seldom find that he repeated any of his designs. On the contrary, his façades abound with various dispositions of the orders, in addition to which he obtained effect and contrast by the judicious use of plain and rusticated walling and the use of arcades.

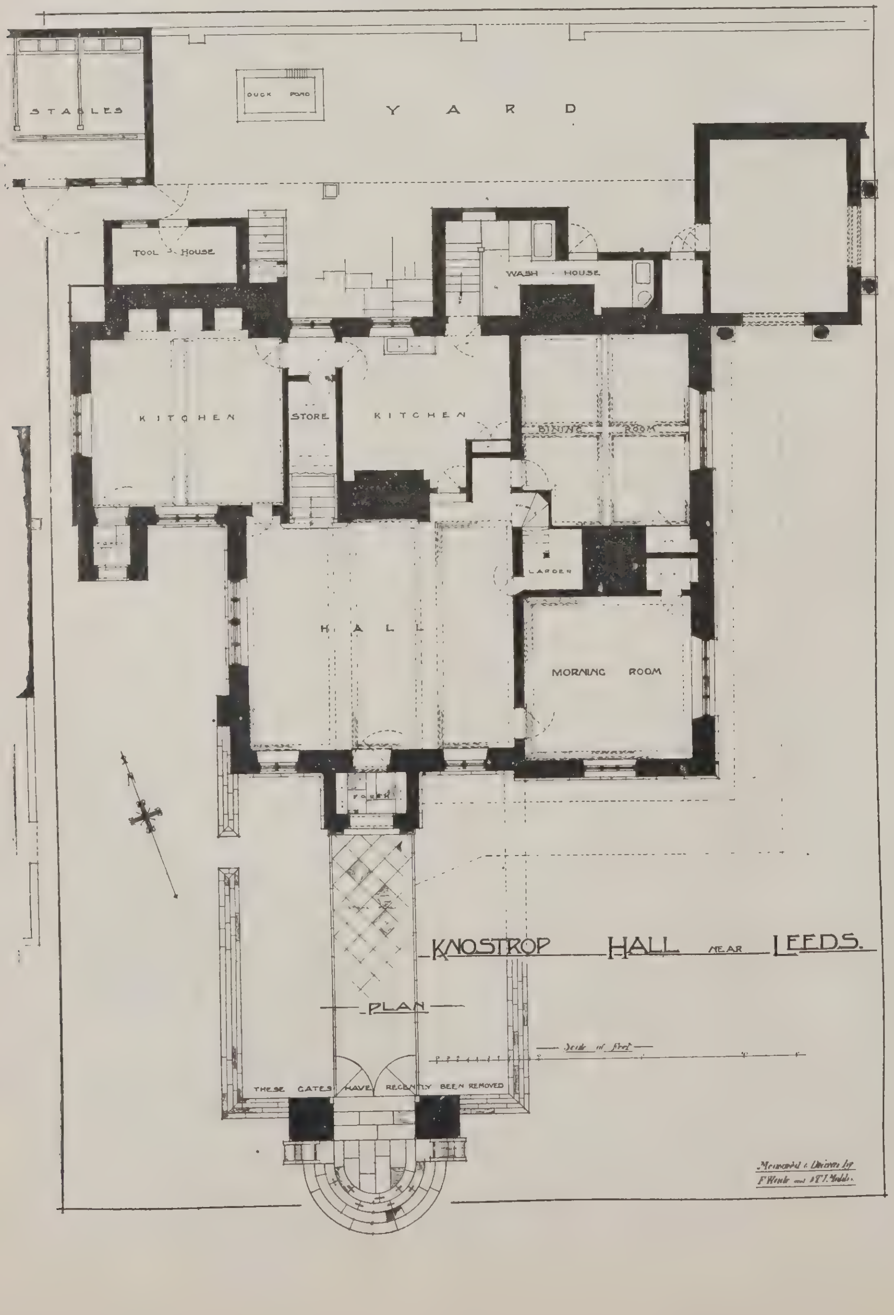
His rustication is often excellent in design and scale, and gives considerable character to his buildings, not in an excessive way, as at Florence, but as a set-off to his columns and their entablatures. In the design of his arcades and of entrance halls he appears to have preferred the larger order, embracing two storeys, with small pilasters placed behind them to carry the floor of the upper gallery.

In these arcades semi-circular arches usually rest on piers in conjunction with a trabeated arrangement adopted from ancient baths. A favourite arrangement, however, was one in which he divided the interval between two piers in three parts by small piers or columns, with an arch only covering the central aperture, a combination which seems to have been copied from some colonnades at Diocletian's palace at Spalato.

In the designs of his doors, windows and niches simplicity seems generally to have been sought after. Fewness in number and largeness in size was his aim. The openings were generally crowned by pediments, alternately angular and circular; but these were never broken—a rococo feature in which he did not indulge. On these pedimented openings he occasionally placed reclining sculptured figures, probably copied from Sansovino or Michelangelo.

The entablature to his orders is generally unbroken, but happy effects are sometimes obtained by projecting the columns beyond the main face of the wall and breaking the entablature around their projections.

In the profile of mouldings he was specially careful; the architraves and friezes were generally plain, the latter being sometimes pulvinated, and his cornices have the consoles and other ornaments carefully centred over each other.



Interior decoration seems to have been somewhat neglected, owing, no doubt, to want of funds.

Perhaps few men, with the exception of Vitruvius, has exercised more influence in matters architectural than Palladio. This was chiefly effected by means of his great literary effort, published in four books in 1570, of which countless editions have been published, and which has been translated into almost every European language. The most interesting to English students is the third edition, published in 1742, as it contains the notes by Inigo Jones taken from his manuscript in Worcester College, Oxford. Mention should also be made of the valuable Burlington-Devonshire Collection now in the R.I.B.A. Library. These drawings of ancient buildings and of his own designs are believed to be by Palladio himself. They show his careful study of ancient buildings in Rome and elsewhere, and from a perusal of them we may agree with Sir Joshua Reynolds that "the greatest natural genius cannot subsist on its own stock; he who has laid up no materials can produce no combinations. The more extensive his acquaintance is with the works of those who have excelled, the more extensive will be his power of invention."

Inigo Jones (1572–1652) was the pioneer of Palladian architecture in England, and it must be confessed that no student so thoroughly studied his master's works as he did.

Lord Burlington paid many visits to Italy, and his life there among the artists of the day seems to have given him an extraordinary liking for and interest in the works of the Palladian school. His collection of drawings by Palladio, already mentioned, and of works by other artists of the period, must have helped very much to have popularised the art of Palladio.

Giacomo Leoni was brought over to England by Lord Burlington in 1715, especially, it would appear, to help in the translation of Palladio published in that year. Remaining in England he executed a number of important buildings, such as Latham Hall, Moor Park, &c., which must have influenced contemporary architecture.

Symmetry and grandeur were the qualities which predominated in eighteenth-century architecture, due in a large measure to the disciples of the Palladian school.

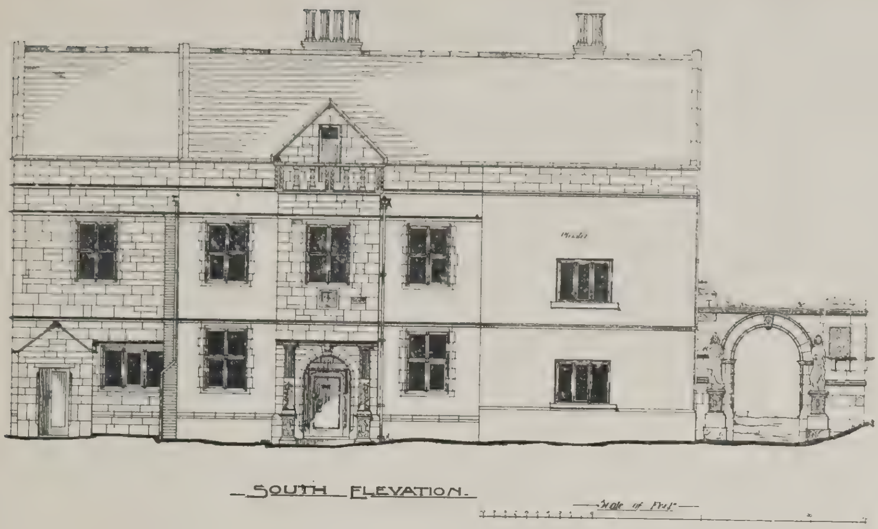
Nicholas Hawksmoor (1666–1763), Colin Campbell (died 1734), Sir John Vanbrugh (1666–1726), James Gibbs (1683–1754), Thomas Archer (died 1743), William Talman (died 1715), the Earl of Burlington (1695–1753), Kent (1684–1748), and Robert Adam (1728-1792), stand out pre-eminently as the followers of Palladio and Inigo Jones and as the developers of the truly national elements of the English Renaissance.

Sir William Chambers, by his writings, and especially his "Treatise on the Decorative Part of Civil Architecture," carried on the traditions, and objected to the Greek revival of architecture, which was then beginning to be felt.

Thus, till within a century ago, the school of Palladio and his English followers was bound up with the traditions of English architecture. In the nineteenth century, tradition being broken up, the age of revivals commenced.

A discussion followed in which Mr. Hugh Stannus, Mr. Louis Ambler and Mr. Hare took part.

The Bells of St. Bride's, Fleet Street, E.C., will be rung frequently and on all festive occasions for the future. For some years, owing to the shaky condition of the tower, it was not possible to ring them without danger, but since the tower has been reconstructed the bells have been rehung and their fittings renewed.



KNOSTROP HALL.

STRIKES.

What is Lawful and What is Not.

It is lawful for a trade union to "call out" its men in order to get rid of another set of workmen, if it is done with the intention of obtaining an advantage for the members of the union. On the other hand, where A had some men in his employ who were not members of a union, and the union, in order to punish these men for not becoming members before, refused to admit them, and induced a customer of A to cease dealing with him by threatening to call out their men in the customer's employ, it was decided that the acting members of the union were liable. Further, where A had incurred the hostilities of three trade-union societies by selling to builders who had refused to be bound by the rules of the societies, whereupon the societies refused to work for any builder upon goods bought by him from A, and so induced a particular builder who had bought goods from A to break his contract with A, it was held that an action lay.

The chief means by which pressure is brought to bear by employers are lock-outs, and by employed—strikes, picketing and black lists. Lock-outs are legal if no contract is broken, *e.g.*, to give notice to the workmen. With regard to strikes, men may combine to leave their employer if they give proper notice to determine their employment. They may strike unless he will raise their wages, and trade unions which assist them by withdrawing their own labour and declining to work, and which assist them in supporting themselves, can do so. As to picketing, it would seem that this, excepting only for the purpose of obtaining or communicating information, is unlawful. Where men where imported from Ireland during a strike to replace the men on strike, and on their arrival were met by agents of the trade union, who offered to pay their expenses if they would return, the conduct of the agents was held to be illegal.

A trade union is in the same position as a company, and is liable for the action of its agents within the scope of their authority, that is to say, it is liable for the acts of its agents done in the course of its business and for its benefit, despite any restrictions nominally placed on their actions.

In the case of a single individual it is established that it is legal for a man to persuade any employer to dismiss his workmen, however bad the motive may be, but not to dismiss his workmen without notice, unless no notice is necessary to put an end to the employment. It is perfectly legal for one workman to persuade another not to enter a particular employment, but it is illegal for him to use threats, *e.g.*, of personal violence, to the man to prevent him from entering the employment. But it it must be remembered that, if two or more persons combine to do such acts, their motive may make all the difference between legality or illegality.—(Extracts from an article in "The Chamber of Commerce Journal" for April.)

A. A. OF IRELAND.

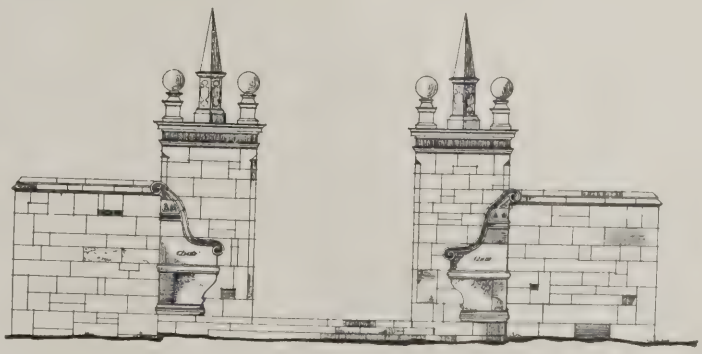
Proposed Irish Qualifying Examination.

There has been a movement during the present session amongst the senior members of this Association to endeavour to have a qualifying examination held by the Royal Institute of Architects of Ireland prior to admission to that body. After seven years' educational work it has been found that A A. members would not enter for R.I.B.A. examinations whilst entrance to the Irish Institute was such a simple matter. A deputation recently waited on the Council of the Institute, with the result that a joint conference is now sitting to discuss whether such a qualifying examination is desirable and feasible. The representatives of the Institute are Sir Thomas Drew, Messrs. W. M. Mitchell, F. Batchelor, W. Kave Parry, G. Sheridan and J. M'Carthy, and the representatives of the Association Messrs. F. Hayes, F. G. Hicks, J. H. Webb, R. M. Butler, C. H. Ashworth and H. Allberry. The matter is of much importance to the profession in Ireland in order that present educational facilities may be reorganized and increased.

WAKEFIELD CATHEDRAL.

Progress made with the Additions.

Throughout the winter the work of enlarging the cathedral at Wakefield, as a memorial to Bishop Walsham How, has gone on very steadily; it is expected that the enlarged structure will be formally opened in the summer of 1904. Over the full period of three years there will have been an expenditure of about £45,000. The same Perpendicular style, which is the predominating feature of the old church, is continued, fine Crosland Moor stone being used. The new north and south transepts are well advanced. That on the north side will soon be ready for roofing. The eastern chapel has risen as far as the window heads. Vestries are constructed on both sides, a fine chapter-house is rapidly assuming shape, a bishop's vestry is near to, and a fireproof muniment room, in which the records and registers may be deposited, has been built. Generally speaking, the enlargement follows closely on the lines of the chancel and crypt at Truro, likewise designed by the late Mr. Pearson. In demolishing the old eastern wall the workmen found several old monumental slabs or stone coffin lids. One of them is elaborately carved, the design suggesting twelfth-century work. Some remains of Norman architecture were found in the walls, and also the upper part of a niche which is supposed to have enclosed the three-quarter size effigy of William de Melton, Archbishop of York in 1329, when the church was reopened after reconstruction. The recumbent effigy of the late bishop, designed by Mr. R. L. Forsyth, is to be placed in the recess of the south transept, and just above the monument will be the stained glass memorial window subscribed for by children of the diocese. The new east window is to be given by the Fernandes family. Family memorial windows are also to be placed in both transepts. Of the total estimate of £45,000 there is about £3,680 yet to be raised before the cathedral extention can be opened free of debt. One rather vexatious cause of expense which the committee encountered was the necessity for purchasing houses lying to the east of the cathedral, and built apparently on the churchyard itself. This, with the compensation for rights of light, swallowed up no less than £8,250. Even now the cathedral suffers by the close proximity of buildings which nestled up close to the old church in days gone by and acquired prescriptive rights which in these latter days have been a veritable thorn in the flesh to those interested in cathedral development.



ELEVATION OF ENTRANCE GATES PRIOR TO REMOVAL.

KNOSTROP HALL, NEAR LEEDS

Bricks and Mortar.

Aphorism for the Week.

Prepare thy work without, and make it fit for thyself in the field: and afterwards build thine house.—PROVERBS xxiv. 27.

Ruskin. IN the course of his "Recollections of Ruskin," which he recently gave to the members of the Richmond (Surrey) Athenæum, Sir William B. Richmond, R.A., said he doubted if any artist had ever drawn architecture with more feeling than Ruskin. He had a most refined sense of form, and as a colourist he was no less remarkable; but it was strange that the inventive faculty as applied to drawing and painting did not appear in his works of art. As he once observed, "I have no power to design; I can only draw what I see." Dealing with Ruskin's strictures on the art of Michael Angelo, Sir William pointed out that Ruskin's mind was cast in the lyric, not in the epic, mould. The weakest part of Ruskin's work was where he dealt with human emotions; his enthusiasm, while it was strong, did not include the tragedy of life. Yet in a sense this limitation was his strength. In its relation to art Ruskin's mind was like the microscope; it was Aristotelian, not Platonic; he worked from the small to the great, not from the great to the small.

Scotch Castles. IN his third Rhind lecture at Edinburgh Mr. Thomas Ross, architect, proceeded to trace the progress of castle-building in Scotland during the Mediæval period. William the Conqueror secured and held his position, he said, by his rapid movements, and by the construction of temporary castles of timber and earth. Few castles of stone and lime were erected till about thirty years after his death, and most of the Norman keeps in England were built between, say, 1120 and 1180. These castles were built by the usurping Norman lords to defend their conquests, and were thus the outcome of circumstances which did not arise in Scotland. David I., whose reign of thirty years occupied most of the Norman keep-building period, had no need of Norman castles to overawe his subjects; and the many Norman families who then came to Scotland appear to have met with little opposition. David was a great church-builder, not a castle-builder, and during the twelve years' reign of his son, Malcolm, the country being then in a state of comparative peace, Norman castles were not required; thus it came about that there were no such castles in Scotland, so that the first period of stone castle-building in England was a blank in Scotland. But as a modified kind of Norman keep ultimately came to be a favourite with the nobility of this country, the plan and arrangements of Norman keeps were explained. Considerable light was thrown on the early castles of Scotland by the Bruce and Wallace; and when built of stone, this circumstance was always emphasized so as to distinguish them from castles built of "tre." It was evident that it need not be assumed that a reference to a castle in the twelfth century in Scotland meant a stone-built structure—the probability being that it did not—and not perhaps till the thirteenth century did stone castles come to be erected in Scotland, and of the type which succeeded the Norman keeps in England, known as Edwardian castles. These were the castles of the first period, and might be briefly described as strongly fortified camps defended by stout lofty walls and towers. Castles of this type were built in great numbers throughout the West Highlands and Islands, and had been vaguely written about as of Scandinavian origin, but they quite agreed in principle and detail with the Edwardian castles of the mainland and of England, so they were Scottish castles.

The new Khartoum. THE special Soudan correspondent of the "Standard" has forwarded an interesting account of the new Khartoum. He says that considering three years ago Khartoum was nothing more than a dirty dust-heap, the work that has been accomplished by the Royal Engineers is truly wonderful. Of course the city is still in the hands of the builders; everywhere are gangs of workmen levelling roads, preparing foundations, making bricks of Nile mud, carrying, hammering, digging, building. Women, too, are employed. Their principal duty is bearing water for the lines of young trees that will one day make each street a shady avenue. Already the town is lighted with lamps far better than in many an Egyptian city, and it is hoped that six months more will see a tramway in working order.

The Doctor and the Architect. INSPIRED by a leading article in the "Times" in which it was observed that many a doctor or architect had found his professional life to consist of two periods—one in which he was too young to be trusted, the other in which he was too old to be efficient: inspired by this observation, appeared some verses in "Punch"—

Two men there dwelt upon a time
Within a certain city.
Both were distinctly men of parts
Well versed in their respective arts.

To fell diseases of the kind
That everyone who can shuns
One of the pair had turned his mind,
The other's forte was mansions.
They were, as you'd no doubt expect,
A doctor and an architect.

The latter, when but twenty-nine,
Planned a Titanic building,
A house of wonderful design,
All marble, stone and gilding.
Said he: "My fortune's made. I wis,
Men can't resist a thing like this."

With eager hope his heart beat high,
He took his plans up boldly,
And thrust them in the public eye:
The Public viewed them coldly.
"Pray take that rubbish right away,
You're far too young for us," said they.

The doctor's turn came next. His was a novel treatment for consumption, but the public sternly rejected it also —

Apparently you quite forget
That you are barely thirty yet.

The years rolled on, but the hapless pair found life no whit the gayer.

And then—the Public changed their mood!
Their hearts began to soften.
They felt the doctor's cures were good—
(They'd had that feeling often).
They also chanced to recollect
The merits of the architect.

"Come plan us mansions, bring us pills."
Their cry no answer rouses.
No one alleviates their ills,
No one designs them houses.
Upon enquiry it appears
Each has been dead for several years.

Sculpture and Painting. PROFESSOR ANDERSON, of University College, Sheffield, lectured recently on the relations of sculpture and painting. The object of the lecturer was to bring out the fact that sculpture reached something like perfection long before even moderate skill in pictorial representation, as we understand it, was obtained; how sculpture affected painting at every step, and how in turn painting reacted on sculpture. In Egyptian drawings, for instance, there is no idea of proportion, perspective, or the right relations of the objects depicted to one another; with a wonderful skill in draughtsmanship and often irreproachable decorative feeling, the artists nevertheless produced only graphic diagrams. Many of these productions, however, are charged with symbolic meaning in every detail. It was much the same in Assyrian art, only here, as the medium was usually low-relief clay modelling, the direct influence of the sculptor's art was sooner seen. In Egypt the only available stone was the exceedingly hard and intractable porphyry, in which the figures are always stiff and unnatural; but when the sculptor was content with wood he readily produced the most natural and life-like figures. Early Greek pictorial art was shown to have a distinct relation to Egyptian and Assyrian, but to have rapidly outstripped it under the influence of the marvellous talent of the Greeks for sculpture; though here also sculpture was seen to be in advance of the graphic art. The invention of bronze casting had a wonderful effect in freeing the Greek sculptors for the development and expression of ever bolder ideas: while both in bronze and marble they reached the perfection of skill in the representation of living and moving forms. Professor Anderson, in conclusion, showed how progress in art was a perpetual striving to pass out of the bounds of convention into freedom, and how in art, contrary to the case in morals, methods and materials must be accounted as nothing provided the result is good. In art any method or any lack of method justified itself if the artist's productions were good.

Spoiling Canterbury Cathedral. MR. RALPH THOMAS objects to the mural tablets on the north wall of the nave of Canterbury Cathedral, condemning them as hideous cemetery masons' tablets with large black borders which do not harmonise with the surroundings. "The Hales (1496) and Boys (1612) bays are delightful, though we could dispense with the commonplace Turner tablet. The next bay has three 'magnificently polished' white marble tablets, with 'ditto black borders': the dates are 1835, 1838 and 1846. Nothing in the cathedral is in viler taste than this bay except those which follow it with their ugly monuments, forming a frightful background to the lovely altar tombs to Archbishop Sumner and Archdeacon Parry. The further bays are at present free." Finally, he regrets to observe the ruthless manner in which the original stonework of the cathedral is cut away to make room for modern monuments.

In the Cotswolds. THE Architectural Association of Ireland held a meeting last week. Mr. F. G. Hicks, president, occupied the chair. Mr. Guy Dawber, F.R.I.B.A., lectured on "The Stone Buildings of the Cotswolds." He said the Cotswold district comprised about 300 sq. miles of undulating country, and contained numbers of most interesting and characteristic examples of domestic architecture. They did not find much of this domestic architectural work earlier than the sixteenth century. During the reign of Queen Anne, when the commercial classes became a power in the country, many of the old Royalist families who had suffered by the Civil War and afterwards by the reckless extravagance of the Restoration were compelled to sell their estates and migrate to the towns. The estates were bought by the wealthy merchants, and this might to some extent account for the want of variety in the style of the houses. The domestic buildings at the beginning of the seventeenth century varied but slightly. The old Cotswold builders managed to get the most delightful effects out of very simple plans of buildings. He showed some peculiarities of arrangement of the stone slates with which the houses were roofed, and said that nothing was attempted in the way of workmanship that the local people could not do themselves. Very little change was noticeable from the sixteenth to the eighteenth century, as the people showed a disposition to cling to old methods, and to think that what was good enough for their fathers was good enough for themselves. Notwithstanding this fact, however, there was a good deal of individual variety in buildings raised even on the most simple plans.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

New Flooring Materials.

LEYTONSTONE.—ENQUIRER writes: "Where can floors of 'Eubœolith' and 'Papyrolith' be seen in or near London?"

Probably the makers could themselves give you the information you require, and refer you to floors already laid down; but the fact that both Eubœolith and Papyrolith are new is evidence that they have not been much used, so that a certain amount of risk must be run in using them. To judge from samples is all that can be done. They appear to be suitable for bathroom use, but we have no data upon which to pronounce a definite judgment. G. A. T. M.

Constructional Ironwork.

LONDON, S.W.—STEELWORK writes: "I shall have in hand presently some heavy building work for India (power-stations, &c.) which has to be substantial, but low cost is essential. Where can I find information on the subject? Various and comparative trade prices and a few detailed drawings would be of value to me."

For heavy work in power-stations, &c, a specialist should be consulted, particularly if economy and safety are to be combined. "Specification, No. 6," contains some information, but the best periodical for drawings and details is the American paper called "The Engineering Record," published weekly at 114, Liberty Street, New York. Annual subscription 6 dols. Parts I. and II., 2nd series, Designing Ironwork (E. & F. N. Spon, Ltd., 125, Strand, W.C., 1s. 6d. and 2s. 6d.) will be found useful.

HENRY ADAMS

Buildings to Measure at Horsham, Epsom and Kingston.

(1) HORSHAM.—STUDENT writes: "Kindly mention any Gothic work in the neighbourhood of Horsham suitable to measure for the R.I.B.A. examination."

(2) EPSOM.—H. F. writes: "Please name some suitable buildings within a radius of ten miles of Epsom suitable to measure for the R.I.B.A intermediate examination."

(3) KINGSTON-ON-THAMES. — STUDENT writes: "Are there any churches within easy reach of Kingston suitable for me to measure for the R.I.B.A. final examination?"

(1) Horsham Church, mainly Early English in style with some Perpendicular additions, appears to be a particularly fine structure; but there is not much else of value for the purpose named within easier reach than Chichester Cathedral, where a few weekends might be very profitably spent. Before going there, the Dean's permission to sketch and measure should be obtained.

(2) The church at Leatherhead is principally of fourteenth-century date, the nave piers being perhaps a little earlier, while Banstead Church, of flint and stone, is chiefly Perpendicular, with some small Early-English windows in the church. There is also a little thirteenth-century work left at Carshalton. All these are within a radius of 10 miles from Epsom, and from among them suitable subjects could doubtless be selected.

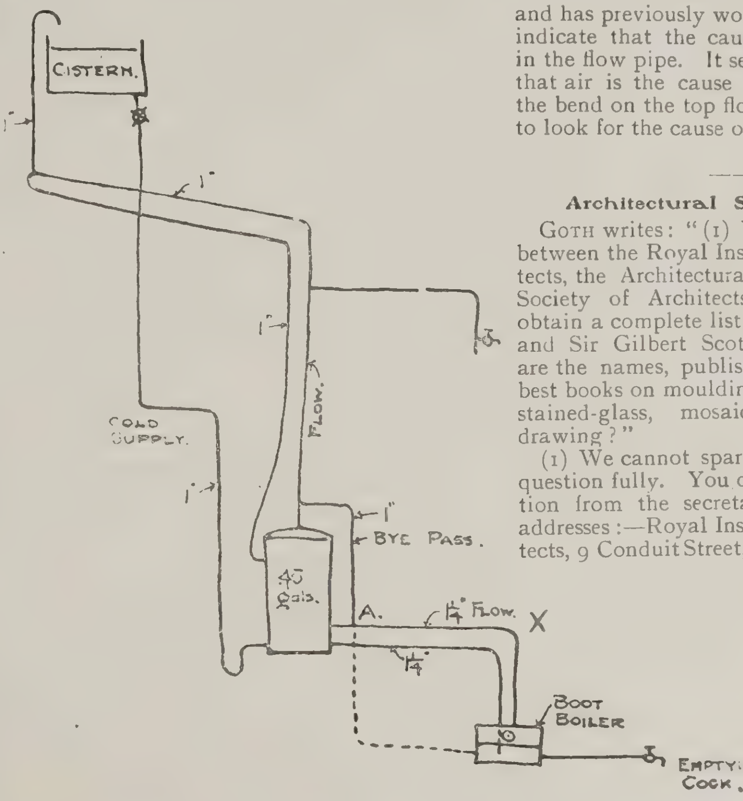
(3) Possibly the Perpendicular church of Thames Ditton would be suitable, or the chancel of Merton; but it would probably be better to spend a few week-ends or a longer holiday in a cathedral city, there being nothing of real importance in the neighbourhood. G. A. T. M.

Hot-Water Apparatus.

HULL.—B. W. writes: "The accompanying sketch shows the hot-water apparatus recently installed in a country house. The system has proved efficient in every way except that the pipes knock at or near the boiler. The plumber offers to stop the nuisance by disconnecting the bye pass pipe from the flow pipe at A and connecting it to the boiler as shown by dotted line. He declares that there are no traps in the system where air can collect, and asserts that he has cured similar cases by this method. The flow pipe does not dip at all into the boiler. I shall be glad to have your opinion on the matter."

It is practically certain that the pipes are too high at the bend where I have marked a cross on the sketch, and that there is consequently an air trap there, or else that there is an obstruction in one of the pipes between the boiler and the cylinder. I do not see how the alteration that the plumber suggests can effect a cure, but if he can show actual instances it might be tried. Even in that event, however, it would be unnecessary, because if the pipes are clear with a continuous rise between boiler and cylinder the water will circulate without noise.

G. A. A.



KIRKCALDY.—D. F. S. writes: "Adverting to the reply to 'Liverpool' in your issue for December 24th last, regarding hot-water supply, it strikes me that none of the systems can work properly. I should feel obliged if 'G. A. A.' could explain by what principle the water in the return pipe from the hall radiator finds its way back to the kitchen boiler, seeing that the pipe dips underneath the floor and has to rise up again."

As to whether any of the systems would work properly, until one or more is tried, can only be a matter of opinion. The principle by which the water in the return pipe from the hall radiator finds its way back to the kitchen boiler is the same as causes water to circulate in any hot-water system, and will be found fully explained in any treatise on the subject. The fact that the pipe dips so slightly would cause no serious difficulty. The most of my hot-water experience, as well as my experience of steam heating, was gained in the United States, and it was very usual there to run the return pipe under the floor when the last fixture supplied was on the same floor as the boiler. G. A. A.

LONDON, S.W.—INSURED writes: "What is the cause and remedy for noises in a hot-water system—supply from boot-boiler at back of kitchen range to hot-water tank in roof fed from cistern? The pipes serve lavatories, baths and a hot-water heater satisfactorily, but at night noises are heard in the pipes to the hot-water tank, which is about 25ft. above the kitchen range. There is no safety-valve on the pipes, except the usual vent pipe direct from the top of the hot-water tank to the outside of the roof. There is also a tapping on the top floor (where there is a bend) when hot-water is drawn from this lavatory during the day."

If this is a new system and the pipes are all clear there are most likely air traps in the pipes, that is, the rise from boiler to tank is not continuous. If it is an old system and has previously worked silently it would indicate that the cause of noises is deposit in the flow pipe. It seems from the question that air is the cause of the noise and that the bend on the top floor is one of the places to look for the cause of the trouble.

G. A. A.

Architectural Societies; Books.

GOTH writes: "(1) What is the difference between the Royal Institute of British Architects, the Architectural Association and the Society of Architects? (2) Where can I obtain a complete list of the Pugin's, Street's and Sir Gilbert Scott's books? (3) What are the names, publishers and prices of the best books on mouldings (especially Gothic), stained-glass, mosaic and architectural drawing?"

(1) We cannot spare space to answer this question fully. You can obtain all information from the secretaries at the following addresses:—Royal Institute of British Architects, 9 Conduit Street, W.; the Architectural Association, 56 Great Marlborough Street, W.; and the Society of Architects, St. James's Hall, Piccadilly, W. (2) In the catalogue to the library of the Royal Institute of British Architects or the British Museum. (3) For mouldings see Pugin's works on Gothic architecture and J. K. Colling's "Details of Gothic Architecture" (published by B. T. Batsford, £2 2s.): methods of delineating them are given in Spiers's "Architectural Drawing" (Cassell & Co., Ltd., 10s. 6d.); "Windows a Book about Stained and Painted Glass," by Lewis F. Day (B. T. Batsford, £1 1s. nett). We know of no recent English book dealing adequately with mosaics. We advise you to consult several recent papers read before the Royal Institute of British Architects, and published in their journal, and "Specification, No. 6." For a book on drawing get Spiers's, referred to above.

Acquirements of a Pupil.

NEWCASTLE-ON-TYNE.—J. M. G. writes: "What reasonable acquirements should a pupil have attained after completing his three years' articles?"

He should be a neat tracer and able to prepare simple drawings from rough sketches and to read plans, and should be able to design very simple buildings, such as cottages and stables. He should have a thorough text-book knowledge of construction and a knowledge of office routine; should be able to sketch well and set up perspective in outline, with correct shadows.

Hydraulics.

NEWPORT (MON.) – H. T. writes: "Kindly recommend a good book on Hydraulics, suitable for preparation for the A.M.I.C.E. examination."

"Hydraulic Power and Hydraulic Machinery," by Henry Robinson (Charles Griffin & Co., price £1 14s.).

Wrought-Iron and Steel Stanchions.

LONDON, N.W.—N. K writes: "Is there any book dealing with the design of wrought-iron or wrought-steel stanchions, giving suitable formulæ for calculating their strength? Hodgkinson's and Gordon's formulæ seem only for cast-iron columns, and Professor Adams in his book on the 'Practical Designing of Structural Ironwork' only includes cast-iron stanchions and pillars. They are so often made now in wrought iron or steel."

See the articles on "American Steel Construction" in "Specification," Nos. 4 and 5.

Finishing Walls to Fives-Court.

LONDON S.W.—E. B. M. writes: "How should the brick walls to a fives-court be finished?"

The joints should be scraped out to a depth of one inch and the wall rendered and floated with one coat of Portland cement (1 part) and clean sharp sand (2 parts), and finished with neat cement or half cement and half sand, $\frac{3}{8}$in. or $\frac{1}{2}$in. thick, trowelled to a smooth surface, this latter following on the first coat before it is dry, and the work done in sections to provide against slight expansion to which cement is liable.

Bending Moments for Beams.

NEWCASTLE-ON-TYNE—STUDENT writes: "What are the formulæ of bending moments for beams loaded as follows:—Beam fixed at one end and loaded at other, beam fixed at one end and uniformily loaded, beam fixed at both ends and loaded at centre, beam fixed at both ends and uniformily loaded?"

See an answer to an enquiry on p. 409 of our issue for June 26th, 1901.

Exposed Woodwork.

LONDON.—M. E. writes: "In order to comply with the local by-laws, the half-timberwork in the gables of a house recently erected was constructed of 1in. deal boards nailed to the brickwork. These boards were given two coats of hot Stockholm tar. The house faces due south and is in an exposed position. In two years the weather has removed practically the whole of the tar. Can you suggest a remedy by which the boards can be made to retain the colour of real half-timber work?"

Stockholm tar will not retain any "face" on fir—at least not for any length of time. The best that can be suggested is to stain the framing with burnt umber in oil, and then to varnish with an elastic, outside, copal varnish. The only alternative is paint—preferably varnish colour. H. E.

Lens for Examining Samples: Rough Cast.

LARGS.—A. L. writes: "Kindly describe a lens suitable for examining samples of stone, sand, &c.; also the method of applying cement rough-cast to brickwork."

There are any number of makers of optical instruments who supply a suitable lens, and it would be invidious to mention any. We advise you to get a microscope with two or three powers, the greatest being one magnifying up to 100 diameters. Rough-cast is applied to brickwork with a wood shovel-shaped implement. Often only the finishing coat is applied in this way, the first coat being composed of smaller stones and applied in the ordinary way with trowels. The rough-cast should be composed of 3 of aggregate to 1 of Portland cement matrix.

The Building Trades' Exhibition.

LOUGHBOROUGH. — INTERESTED writes: "Will there be a building trades' exhibition this year?"

Yes. It will be held at the Royal Agricultural Hall, Islington, from June 13th to 20th.

Plaster Cornices.

ALLOA.—STUDENT writes: "Please recommend a cheap book on plaster cornices for plain and cove ceilings, illustrated by detail sketches. I have seen Miller's book on plastering, but it is not what I wish."

We do not know of any book such as you require. Kemp's "Practical Plasterer," though illustrated, is not what you want.

Concrete Floors.

WINDERMERE.—R. W. writes: "Would a concrete floor for a private house formed with **I**-shaped main joists, and **T**-shaped minor joists, put 2ft. 6in. apart with 6in. or 7in. of concrete, be an expensive form of floor and less likely to cause disturbance to a room below than ordinary joists and boards? I propose to insert 3in. by 2in. scantlings in the concrete for fixing flooring to. Would it be well to leave a space of about 1in. between the boards and concrete, or should the boards be put down on the concrete with a composition to prevent decay?"

The form of floor you propose would be considerably more expensive than an ordinary timber one and would allow almost as much sound to pass though. A wooden floor protected by a slag-wool slab ceiling with slag-wool filling would be far better. If concrete is adopted it should be tarred first and the boards laid direct on it, nailing to wood fillets as you propose.

Pargeting.

SHEFFIELD.—A SUBSCRIBER writes: "What should be the proportions in making dung mortar for pargeting a chimney flue? Kindly name a small book containing useful information for builders."

Pargeting is made of 1 part of lime and 3 parts of cow-dung free from litter. It should be used fresh. Hurst's "Architectural Surveyor's Handbook," 4s. nett (Spon). A larger work which you should possess for reference is "Specification, No. 6." A series of seven articles on "Building Notes and Memoranda" was published in our own columns last year.

Roof-Truss to Carry Top Floor.

HARROGATE.—DOUBTFUL writes: "Is the construction shown by the accompanying sketch (not reproduced) proper for a warehouse floor having to carry oats, corn, &c, columns being dispensed with on the floor below, which is used for storing hay, &c., thereby putting the weight of the top floor on to the principals? What dead load should a floor so constructed safely carry? If each principal were further strengthened at each queen-post and tie-beam by the additions shown, what extra load would the floor carry, and is there any other better means of strengthening than this?"

The weakest part of this roof-truss would be the foot of queen-post if held by plain strap as shown on one side. A double 1in. tie-rod with $1\frac{1}{8}$in. screwed ends, strap over principal rafter and plate under tie-beam, would greatly increase the strength. If the tie-beam is made 12in. by 6in., tie-rods added as above, and the other parts as shown, it is estimated that the floor would be safe with a distributed load of 2 cwt. per ft. super., which would mean one tier of sacks only. The coach bolt into the foot of the king-post through the straining beam is useless as shown, as the thread will not hold in end grain. This should be a bed bolt, *i.e.*, a bolt with the nut let in the side of the king-post.

HENRY ADAMS.

The Design of Flats.

EDINBURGH.—L. W. writes: "Is there any publication or magazine article, &c., on the planning and management of high-class 'mansions'? What average number of rooms to each house has been found most suitable?"

I know of no publication dealing with the planning and management of high-class "mansions." In the pages of "Flats," "an illustrated paper for owners and occupiers and all interested in flats and maisonettes" (published by the proprietors, Messrs. Robins, Snell & Terry, 95, Victoria Street London, S.W.), many illustrated articles have appeared during the past few years dealing with the largest of the flats and residential hotels in the metropolis, together with one or two special articles on Parisian flats; and these might be referred to with advantage. Artillery Mansions, Moscow Mansions, Sloane Gardens House (ladies' residential chambers), Hyde Park Court, St. James's Court –these and a dozen others are types of flats mansions where tenants are catered for and valeted and the servant problem finally solved. Plans of these and many ordinary flats buildings could, I believe, be obtained from the proprietors of "Flats." The best letting suites in London contain from two to three reception rooms and three to five bedrooms, with office and servants' apartments added. In the larger suites there should be at least two rooms for servants' bedrooms, and these should be relegated to that portion of the suite containing the offices, but, at the same time, should have no communication with them. There are many very excellent buildings in London the planning of which is spoilt by the servants' bedrooms leading direct from the kitchen. I know even of a building where the servants' water-closet and the larder form one apartment; but this is, of course, exceptional. You cannot do better than obtain plans of some of the best buildings, evolving after a careful consideration of these your own perfected scheme. It is certainly strange that the literature of architecture should contain no work on buildings of this class. A paper on "Flats; Past, Present and Future," was read by Mr. Leonard J. Snell before the Auctioneers' Institute on November 14th, 1900. A paper upon the planning of flats was read before the Sanitary Institute about four years ago and was published in their proceedings. And a paper on "Flats" was read by Mr. E. T. Hall before the Architectural Association on January 18th, 1901, and published in THE BUILDERS' JOURNAL for January 23rd.

B. W.

Cesspools.

FREEHOLDER writes: "In an urban district having no drainage scheme the following is the by-law relating to cesspools: 'Every person who shall construct a cesspool . . . . shall construct such cesspool in good brickwork in cement and with a backing of at least 9in. of well-puddled clay, &c.' As a matter of fact, this form of cesspool is never used in the district. The form of cesspool which is always used—with the approval of the sanitary authority—is a well sunk about 25ft. or more deep into the chalk lined with brickwork built dry—thus known as the soak-away dumb-well system. I propose to open up an estate. (1) Am I legally safe in using the soak-away dumb-well system? (2) Can the Local Government Board object? (3) Can adjoining owners object? (4) Can other ratepayers object. If after dumb-wells are constructed, and either of the above do object to the use of dumb-wells, (5) what is my position, and (6) what is the position of the sanitary authority who approved such a questionable form of construction?"

(1) Hardly. You do it at your own risk, unless the local authority has a saving clause which enables it to modify its by-laws in

dministration. (2) Yes. (3) Yes. (4) Yes. 5) You would have to reconstruct in accord nce with the by-laws. (6) You could sue t for the cost of such reconstruction; but he result is very problematical. See answer o question (1). *Generally:* Is it worth while o initiate such an extremely insanitary ystem, remembering your own and your lient's interests? The soak-away system oisons the surrounding ground, and is exremely prejudicial to wells and water-sheds; nd, if we are not misinformed, the water uestion in your district is somewhat acute urther, why construct such an enormous esspool? Is it meant to serve several houses? f you drain several houses into one pipe eading to a cesspool you create a sewer hich the local authority (being bound to aintain) will, naturally, oppose. If you ave a cesspool for each house, one 12ft. deep y 10ft. in diameter will be sufficient size. should be cleared at least twice a year. water-tight cesspool is practically a septic ank, and aërobic bacterial purification takes lace in it.

CONTINENTAL NEWS AND OPINIONS.

[The following extracts have been transated for The Builders' Journal from the erman and Russian press.]

Fires and Soot.

In the German town exhibition to be held his year in Dresden a special section will e devoted to protection from fire and soot. t will include fuel, fireplaces and apparatus or the reduction of soot or smoke, regulating pparatus, and apparatus for receiving and emoving soot, &c.

Iron for Buildings in Russia.

The Russian Finance Minister, M. de Vitte, has been making exhaustive financial eports to the President of the Russian echnical Society, saying, *inter alia*, the rotection system as applied to the Russian etallurgical industry has already led to his point, that the price of the most imporant product, iron, has reached such a low evel that it may now be extensively and rofitably used for building purposes. He proeeds to say: "When we consider the buildg situation in Russia, it appears as though e builders were afraid of iron and would se nothing but bricks and wood. This was omprehensible when the price of iron, say fteen to twenty years ago, was very high; ut we may now hope for a much more xtensive use of this metal in buildings," and e finally adjures the Society he addresses to all a special congress to take the initiative pressing the question forward. He then dicates how he thinks the congress should e composed; and as such an invitation is ntamount to a command in Russia we are ot surprised to read from the "Russische-eutsche Bote" that the Society most wilngly adheres to the Finance Minister's ggestion, and has appointed a committee give effect to it.

A Well-Conceived Competition.

The Academy of Fine Arts in Berlin holds ery third year a competition of a peculiar nd. Only Prussian architects are admitted it, and candidates must not have passed eir thirty-second year. Persons qualified der these conditions are required to submit ans, elevations, perspective drawings, secons and photographs of some building tirely carried out from their designs and der their direction. These documents are spected by a jury, which awards to the thor of the best a prize, consisting of the m of 3,300 marks, which the winner is liged to spend in a year's travel and study, his discretion, the only restriction being that, unless he is familiar with Italy, he must spend a part of his time in that country. As the prize is awarded only once in three years, it does not constitute a very heavy drain upon the resources of the Academy, while it affords a valuable stimulus to young architects to study their early work to the utmost in the hope of winning such a distinction.

Trass Cement.

In the dams hitherto carried out in the Rhenish province and Westphalia, and also in the weirs of Lauchensee in the Vosges, trass-lime cement has been used in the proportion of 1 part of lime to 1½ parts of ground trass and 1¾ parts of sand. The peculiar properties of trass mortar—its slow setting and its elasticity—make it very valuable. It may be left for days, should building be interrupted by rainstorms, and still be serviceable, and its elasticity when set allows expansion and contraction of the finished work without cracks.—("Centralblatt für Bauverwaltung.")

Cement Works in Russia.

About ten years ago the cement industry in Russia was very insignificant. In the southern part there was only one factory, that of the Black Sea Company, at Novorossisk. This was a German enterprise, and its output was never more than 30,000 barrels. The Black Sea Company may be said to have had a monopoly and the price it got (over five rubles per barrel) finally attracted competition. The metal and mining industries increased very largely in the district served by the cement company, and the demand for cement increased in proportion, so that it was possible to profitably import foreign cement. About the end of 1896 a French company started a factory about 22 miles distant in the direction of Batoum. This example was soon followed by others, and in 1898 the Black Sea Company, which had stood alone for seventeen years, had eight new competitors. Notwithstanding the extraordinary increase in the demand for Portland cement, which rose from 400,000 barrels in 1896 to about 1,500,000 in 1901, the greatly increased production brought down prices to such an extent that, in 1900, the older factories paid no dividends and the others suffered severe losses. Some of them had to go out of business entirely. In order to prevent further lowering of the price an association of cement manufacturers has been formed. Whether this will do any good remains to be seen. The bigger concerns will probably be able to stand. There is no lack of raw material, and fuel and labour are cheap. Attempts will be made to reduce expenses, and to this end the casks, which were brought from Poland. will be made on the spot, as wood is plentiful. In this way it is hoped that the industry will develop in a satisfactory manner.—(Th. Ind. Z.)

The Imperial Testing-Station at Berlin-Charlottenburg.

The "Praktische maschinen Konstrukteur" gives a full account of the operations conducted by this testing-station during 1901, and a few figures showing what was done with building materials will illustrate the imperial care devoted to such matters in Germany. In the first place, it is noted that the station grows yearly in favour. During the year in question 32,580 tests were made, against 31,982 tests in the preceding year. Some of these were carried out at the request of foreigners. Of the 1901 tests, 20,391 were of binding material; 12,189 of various kinds of stone. Amongst the roofing material tested was a considerable variety of expanded-metal work, some of the metal being galvanised with tin or copper, besides hollow-stone material and brick. Armed-cement was especially dealt with. There was a considerable reduction in the number of tests of ordinary concrete, probably because the large consumers made their own tests. But many more tests were made with trass-lime mortar. There was a considerable increase in the number of samples of lime sandstone, showing that this is coming into use. Another notable feature of the tests was the number of samples of jointless flooring in imitation of linoleum and woodwork. For this purpose for the first time the sandblast has been employed in producing patterns on these materials. A committee appointed by the Minister of Public Works and for Trade and Commerce was charged with the testing of gypsum; samples are being obtained from abroad as well as at home, and the committee has paid a special visit of inspection to the gypsum works in the Harz Mountains, which are centuries old.

Turkestan Houses.

After the annexation of Central Asiatic Khanates, says the "Novoe Vremya," we began a type of building like Swiss, Tyrolean, Caucasus or other mountain places. The walls of the large Turkestan houses consist of wooden carcases strengthened with a system of uprights bound together with beams above, the carcase being filled up with burnt-brick or dried clay. Such houses, if raised about 2ft. from the ground, are very lasting, especially if the lower beams are steeped in tar. When earthquakes occurred, the inhabitants of two-storeyed houses hastily left their homes, whilst those in the frame-houses remained indifferent, and were not frightened even by the falling of a cornice: so that in future no house should be encouraged that is based on brick. Many of our architects will cry out against this, as they will not be able to utilize the style they have learned; but we can have beauty with the Swiss or Tyrolean styles, and combine the carcase system with it.

Russian Theatre Architecture.

Before the Russian Architectural Society (as reported in the "Novoe Vremya") Mr. A. K. Montag gave a lecture a short time ago showing the disabilities under which the Russian theatre architect labours, as compared with his colleagues of other countries, owing to Government restrictions. The German conditions are much simpler, and as a consequence the Russian theatre has remained much inferior to the German. For example, whereas in the Russian small theatre there can only be one range of boxes besides the parterre, in Germany there may be four rows. Again, business premises are not allowed to be combined with large theatres, whereas in Germany this is permissible. In addition, there are various technical restrictions: so that during the last thirty years not a single large theatre has been built in Russia. The lecturer concluded with the hope that this state of things would be changed by the agitation of the Russian architects.

New Buildings in Berlin.

The "Deutsche Bauzeitung" in its description of Ludwig Hoffmann's work on Berlin building says that the best basis for the artistic representation of a building is a clear unconstrained ground plan, bearing simply in mind the purpose of the building. If the plan is good, it does not need much art to give an artistic effect to the superstructure. But on the other hand, the brightest ideas do not suffice to make up for the faults of a defective plan. A work of art can never result from a collection of good ideas without a good general design. The "Centralblatt für Bauverwaltung" accepts this standpoint, and charges the author with inconsitency when he says that Italian plaster façades are good for common schools and schoolmasters' residences. This is an expensive dress for such buildings. It has hitherto been used only for high-class houses: then what becomes of the general principle that every building should express the object of its existence?

Views and Reviews.

Conversion of Timber.

The use of English timber has of recent years so receded into the background before the invasion of foreign timber that we are inclined to unduly overlook it and forget the way in which to handle and use it. Such a book therefore as this not only renews attention to the many advantages which English timber possesses, but keeps in permanent form a mass of information and experience in the conversion of timber for the market which under the close competition was likely to be lost. This little book should be in the hands of every timber merchant and timber worker. The author's *nom-de-plume* is familiar to readers of the "Timber Trades' Journal."

"English Timber and its Economical Conversion," by "Acorn." London: William Rider & Son, Ltd., 164 Aldersgate Street, E.C. Price 3s. 6d.

The Great Nineteenth Century.

This is only a small book and yet it sets forth the aims and achievements of art during the nineteenth century in a comprehensive manner, as one would expect from so eminent a critic as Dr. Waldstein. Moreover, it is a decidedly refreshing book to read, because instead of abuse or condemnation we find eulogy of the past century; indeed, the author feels himself to be in the very midst of a vigorous art life surrounded by the growth of great things in all matters human—"so great, important and epoch-making, that I doubt whether in the whole of the race a like outburst of energy can be found." Art to him is not painting only, but literature, music, sculpture, architecture, and all else that arises out of man's natural desire for harmony. Similarly, he gives a wide meaning to science, and strongly contradicts the assertion that an age must be either of science or of art, holding that a great age is likely to produce great people, great in many different things—"the achievement of Plato and Aristotle was as great in science as that of Phidias and Sophocles was in the dominion of art. The same must be said of the leaders of the Renaissance. The same can be said of the nineteenth century. It is emphatically untrue that the achievement of the nineteenth century has been less in art than in science." Dr. Waldstein considers the past century was the age of artistic expansion—in "landscape painting, which has been carried on in the nineteenth century in a manner and to a degree unknown to previous generations"; in literature ("I for one am astounded at the number of remarkable books produced every year . . ."); in music, poetry, sculpture, architecture and decoration.

Dr. Waldstein is above all a modern, and looks forward to development in the spirit of our own age; so that it is fitting he should admire Rodin's work and believe even that sky-scrapers could be converted into imposing tower-like structures, and railway stations and exhibition buildings made impressive. He confesses, however, that for many years he could not put himself in sympathy with many genuine sculptors of the type of Rodin, and the rough and broad impressionist manner in which they worked their uncoloured statues in stone and bronze. "For I felt that the sketchy and unfinished character, the suggestion of the accidental which the appearance of such works produced, were contrary to the essential nature of sculpture . . . But I learnt to recognise the justification of artists of the Rodin type when I realized that the range of sculpture, as regards subjects to be presented, has expanded in our own age; and that the new forms of expression which these new ideas required have shifted the monumental qualities of sculpture on to a different plane."

Of "L'Art Nouveau"—the art of macaroni and the mutton bone—Dr. Waldstein speaks with caution—he believes it was born in America with the Philadelphian Exhibition of 1875, and carried to Europe through the illustrated magazines.

The book is of much interest, and exhibits the wide learning which its author possesses. We note, however, that Chavannes is spelt without the "s" (p. 74); Copley Fielding with a comma between, as if it were two men (p. 62); and "Adams's" instead of Adams or the Brothers Adam (p. 81).

"Art in the Nineteenth Century," by Charles Waldstein, Litt.D., Ph.D., L.H.D. (a University Extension Lecture delivered at Cambridge). Cambridge: The University Press, price 2s. nett in cloth. paper covers 1s.

Mineralogy.

This book by Prof. Henry A. Miers deals only with the character and properties of materials. It does not deal with the modes of occurrence of minerals, their geological distribution, their origin, their alteration or their artificial reproduction. The book is very wisely confined to the former, for it already consists of 584 pages, and another volume would be required to deal with the other branches of the subject of mineralogy. Besides, this division makes the subject clear to the student, who, when he has mastered this book, can proceed safely to the other branches. Professor Miers is a great authority on this subject, and he has produced a most excellent treatise, so very clearly written that anyone having even a slight acquaintance with general science cannot fail to easily grasp almost everything in it. The book is divided into two parts; the first deals with the crystalline and general properties of minerals, the relations between the properties, and the description and determination of minerals; the second part is a description of the more important mineral species. The book is concluded with a number of tables and a very full and carefully prepared index; it is most fully illustrated with about 700 clearly drawn figures. Minerals are defined and determined by the study of two properties which they possess, namely, chemical composition and crystalline form. Minerals may have the same chemical composition and yet differ in all other essential properties, and, on the other hand, they may have the same form and yet differ in all other respects, but if they are of the same form and composition they will certainly have in common other properties, and are said to belong to the same mineral kind; there are about 800 kinds. The properties of minerals can be divided under the heads of general (such as density, specific heat, temperature of fusion, and chemical composition), and directional (such as cohesion, elasticity, and numerous optical, thermal, electric and magnetic properties, and, as well, the crystalline form). If a mineral has all its directional properties in the same direction it is said to be amorphous; when some of them vary with the direction they are said to be crystallised. An amorphous material has no characteristic shape (such as powder or glass), but every crystallised material has one—a body exhibiting its characteristic shape being called "a crystal." The form of a crystal is due to the substance of which it is composed and not to the conditions under which it has been crystallised, and is therefore a fixed property for study. The study of minerals along these lines has progressed greatly of recent years, and we are under a great debt of gratitude to Professor Miers for having summarised so masterly the facts discovered. The study of minerals is of the utmost importance in the study of the composition of building stones and their resistance to stress and atmospheric action, and anyone investigating the subject from this point of view should procure this book.

"Mineralogy: An introduction to the Scientific Study of Minerals," by Henry A. Miers, D.Sc., M.A., F.R.S., Waynfleete Professor of Mineralogy in Oxford University. London: Macmillan & Co., Ltd. Price 25s. nett.

Construction Notes.

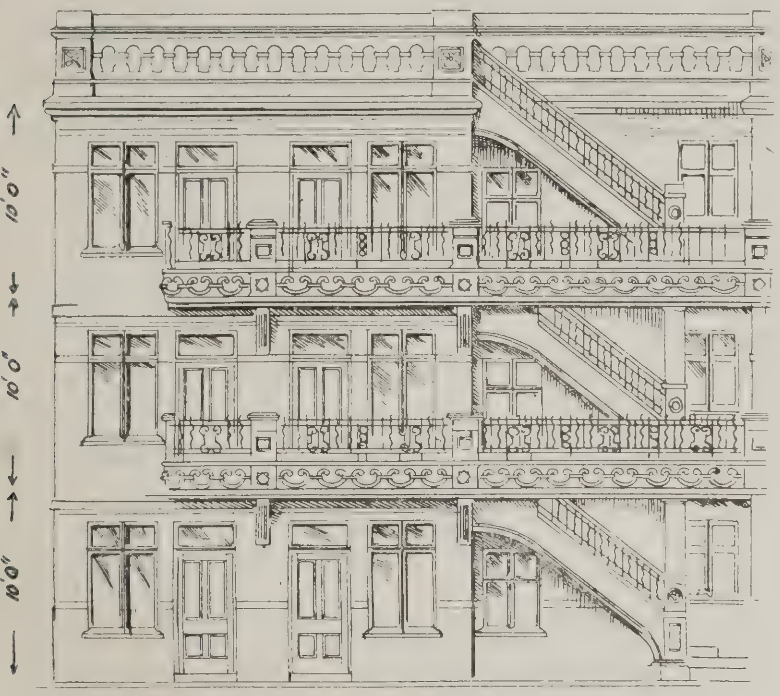
Corrosion of Steel. SENSATIONAL statements have recently appeared in the press about a new process of hardening and "annealing" steel so as to protect it against atmospheric action. Until we have further and fuller information, the real value of the process cannot be determined, but we wait in the hope that expectations will be justified. The process is known as the Holzer-Frith process, and was discovered about three years ago. We are told of experiments that have been made to test the resistance to corrosion of steel which was treated by it. Two similar pieces of steel—one treated by the new method—were immersed in sulphuric acid for seventeen days, being taken out and exposed to the atmosphere for fifteen minutes three times each day. At the conclusion of the test it was found that the piece not treated by the new process was eaten away to the extent of 75 per cent., whereas the treated piece was not perceptibly corroded, and was barely discoloured. So much for the question of protection from corrosion. Now, as regards the hardening. Under the present method of cooling by plunging hot steel into a cool medium, such as oil, water, &c., the steel is hardened it is true, but is usually rendered very brittle owing to the irregular contraction, which causes great internal strains. Under the new system the operation of plunging is done away with, the material to be treated being placed in a tank containing mercury at ordinary temperature capable of being hermetically sealed. After sealing the tank, heat is applied by gas or coke furnaces, and the material is not removed until cold. During the time of cooling an electric current acts on all sides of it—this part of the process is still guarded as a secret by the inventors. The result is stated to be a very hard and very tough uniform material which resists corrosion by salt water or the atmosphere. The new process costs shillings where the old system costs pounds. The Government, we are informed, have investigated the process, and the experts are stated to have sent in a favourable report; the great Armstrong firm at Elswick are likewise stated to have tested the process with favourable results. If all that is claimed for the process is justified, some of the greatest difficulties in the application of steel to structures will be overcome. We have already pointed out that one of the most promising lines of research in the protection of iron and steel against corrosion lies in the direction of an alteration of the molecular structure of the material. Attention has hitherto been chiefly paid to protective coverings, such as paints or the Bower-Barff process (this consists in heating iron to about 538 degs. Centigrade in an atmosphere of superheated steam, which decomposes to form a coating of black ferroso-ferric oxide of iron). The cost of applying paints, &c., to ships and bridges totals to an enormous sum yearly. The Forth Bridge alone costs £40,000 a year to maintain. Perhaps under this process, or another on similar lines, we shall see a great development in the use of exposed ironwork in architecture. Architects have felt an aversion to doing this up to the present, disliking the constant painting, which flakes and looks bad in a few years, and have hid it as an unsightly thing. Engineers too seem to feel this. But at what cost of the beauty that comes from the logical expression of structure this avoidance has been productive of in modern architecture and bridge engineering we all know. Perhaps now we shall have a reasonable treatment of the modern shop front, though it has always remained open for the bold architect to electro-plate the iron girder and stanchions.

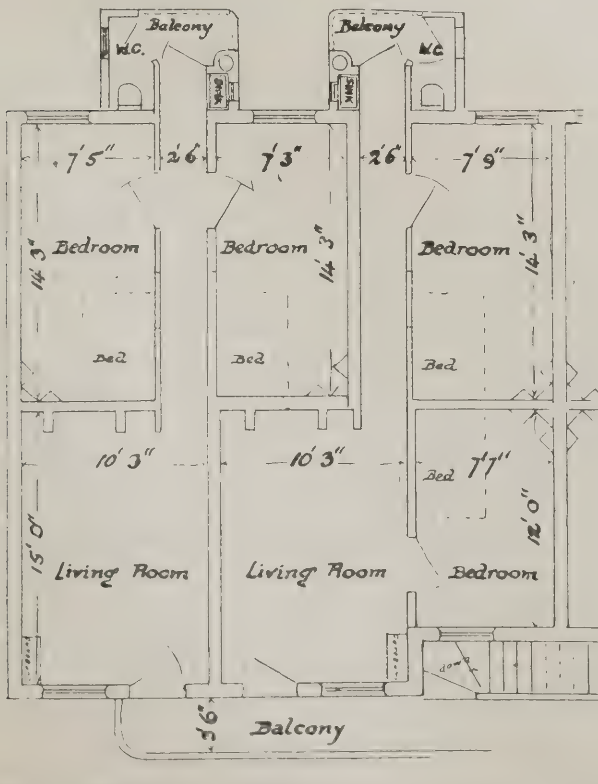
H. K. D.

LIVERPOOL'S CONCRETE COTTAGES.

As already announced in our columns, the Liverpool Corporation proposes to erect some concrete dwellings in Eldon Street, according to the designs of their city engineer (Mr. John A. Brodie, M.I.C.E.).

The building will consist of three floors, on each of which four tenements are arranged. Each tenement comprises a living-room 15ft. by 10ft. 3in., and two bedrooms averaging 7ft. 4in. by 14ft. 3in., the height of the rooms from floor to ceiling being 10ft. The floors will be covered with ¾in. boards or other suitable material, laid on the concrete. The arrangement of the bedrooms relatively to the passages and conveniences is such that, if thought desirable, pairs of tenements can be used as two three-roomed houses, or alternatively as one four-roomed house and one two-roomed house. A fireplace and chimney is shown in each room, and through ventilation and light is provided. A cupboard for food is provided in each living-room against an outer wall, which is perforated to admit of free ventilation. Each tenement has a scullery, separate w.c. and ash-shoot accommodation, these being arranged in a projection at the back, and together with the drainage connections are kept outside the main building. Each tenement is provided with a separate entrance doorway from the balcony facing the street. The stairs and balconies are on the front elevation, and open to full view from the street, with the object of avoiding the evils of common stairs and passages within the buildings. As the roof is practically flat (the slope being that usually allowed as cross-fall for flagged footwalks), a stair has been provided to the roof, which, being surrounded by parapet walls and made waterproof, can be used for washhouses and drying-ground or, if desired, as a playground.





LIVERPOOL CORPORATION COTTAGES. JOHN A. BRODIE, M.I.C.E., ARCHITECT.

The materials to be used in the construction of foundations, walls, floors, roofs, &c., of these tenements will be crushed clinker from the refuse-destructors and Portland cement, with a small proportion of embedded steel or iron. The crushed clinker and cement will be mixed in proper proportions at the destructor depôt, and filled into moulds to form slabs, each slab representing a complete side, floor or roof of a room. The openings for doors, windows, &c., as well as the fireplaces and flues, will be formed in slabs, and projections in the nature of dovetails with their corresponding notches or cavities are provided, so that each slab may be dovetailed to each of the slabs with which it comes in contact when erected, the permanent jointing material being cement-mortar. The balconies, stairs, balustrades and the chimneys, where they rise above the roof, are similarly moulded in blocks. The site of the buildings will be excavated where necessary, and the foundations composed of the same materials filled *in situ*, brought up to a level surface at the ground levels and allowed to set. The drainage, water and gas connections from the street are also put in and brought up to the ground level adjoining or under the site of each w.c. or scullery. When the various slabs and blocks have matured, they are lifted, placed on wagons behind a traction engine, and removed to the site of the proposed building. They are here lifted from the wagons by an overhead travelling crane, and deposited in their final position in the building. When the building has been erected, the windows, doors, grates and fittings are fixed in position, and completed as usual.

The engineer's estimate of the cost of the scheme is as follows:—

	£	s.	d.
Land— 413 sq. yds. at 12s. per sq. yd.	247	16	0
Cost of buildings complete, including drainage and finishing open spaces -	1,230	0	0
Capital expenditure -	£1,477	16	0
Twelve tenements (each consisting of three rooms) at 4s. per week, making a gross rental per annum of -	124	16	0
Less—Allowances for outgoings, say 40 per cent.	49	18	4
	£74	17	8

Or equal to a 5 per cent. return on the capital expenditure.

In the case of the first block it will be necessary to execute most of the work by hand labour; but if the experiment warrants the erection of further blocks on this system, the additional economies obtainable from conveying and mixing the materials in the first instance, and the subsequent handling of the slabs by mechanical arrangements, would enable the actual cost to be materially reduced.

We have already expressed our opinion that suitable concrete cottages can be erected, provided the work is carefully supervised, and we are therefore glad to see this experiment adopted by the Liverpool Corporation: but, though the plan has its merits, we cannot regard the elevation as satisfactory. The design is commonplace and the railings and embellishments on the balconies, the windows and the parapet, exhibit a sorry lack of architectural taste.

Law Cases.

What is a Sky-sign?—Mr. Francis gave his decision at the South-Western Police Court last week that an advertisement board standing out from the face of a building at a considerable height from the ground, but not above the roof, was not a sky-sign within the meaning of section 125 of the London Building Act.

An Alleged Bogus Building Concern.—At Scarborough Police Court on March 27th James Bakes, accountant, and Charles Strich, clerk, both of Scarborough, were committed for trial on charges of fraud and conspiracy in connection with an alleged bogus building concern, which they conducted under the title of the Northern Counties National Building Association, with an invested capital of £200,000. The *modus operandi* was to induce people to subscribe amounts periodically on the representation that within easy time they would become property owners, and it was alleged that the prospectus and other documents contained misstatements in respect of the location of the chief office, the directors' names, and other matters.

Builders' Successful Action against the Gravesend Corporation.—The case of *F. & E. Davey* v. *the Mayor, aldermen, and burgesses of the Borough of Gravesend* was recently heard in the King's Bench Division of the High Court of Justice. It was an action by builders and contractors to recover the sum of £2,544 as damages for breach of contract and the wrongful seizure of their plant by the defendants. By an agreement dated November 30th, 1901, the plaintiffs contracted with the defendants to build electric-lighting works at Gravesend for £7,094, according to a specification and conditions. The engineer was Mr. Trentham. Plaintiffs had carried up the chimney shaft 53ft. and erected the engine- and boiler-house, when the defendants expressed dissatisfaction with the work. It was decided to take the advice of another architect, and in April, 1902, Mr Crickmay, F.R.I.B.A., was asked to make a report. Mr. Crickmay did so, condemning a great deal of the work as not being according to the specification, and also condemning the chimney shaft as not being on proper foundations. Mr. Trentham then decided that the chimney shaft must come down; and after consultation it was agreed that the plaintiffs should rebuild the chimney shaft at an extra cost of £25. Mr. Trentham then gave the plaintiffs a certificate for £1,500, which he lodged with the town clerk on May 15th. The next day he wrote to the plaintiffs saying that owing to the defective state of the work he intended to retain the certificate he had given, and on May 23rd he wrote saying that he would not allow any new work to be done until the unsatisfactory work was set right. On May 30th the town clerk wrote the plaintiffs that the Council had arrived at the determination to stop the work. At the date of the stoppage the plaintiffs had done £6,300 of work, and had received £4,000, leaving a balance due to them of £2,300, and they also left on the premises plant and material to the value of £150 – For the plaintiffs Mr. Woodward and Mr. Thompson, architects and surveyors, stated that the brickwork was good, also the mortar, and the plaintiffs' work had been carried out quite satisfactorily; that the small variations from the specification could easily have been rectified by the contractor if the matters had been brought to his notice; and that the fault with the chimney shaft was owing to the site being water-logged and not with the building. – For the defence Mr. Crickmay stated that the brickwork and joinery were unsatisfactory. Fletton bricks were used instead of stocks; pit gravel instead of Thames ballast was used for making concrete for foundation; the fire-bricks were of inferior quality; the mortar in the chimney shaft was of inferior quality; the pointing was bad; and various other small matters were not according to the contract.—Mr. Justice Lawrence, in summing up to the jury, commented upon the absence of Mr. Trentham from the witness-box, whom he characterized as the only witness who could tell them all about the matter. His Lordship said it appeared that outside pressure had been brought to bear upon Mr. Trentham, who began to make complaints about the work which he had never made before. There was no doubt that Mr. Trentham saw the materials that were being used, and the question was whether, as the defendants' representative, he did not acquiesce in their being used. Did not that point to the fact that the trouble was between Mr. Trentham and the Corporation, and not between the plaintiffs and the Corporation, and the reason of bringing down Mr. Crickmay was that pressure might be put upon Mr. Trentham to do what the Corporation wished? With regard to the £1,500 certificate, it was said by defendants' counsel that the question of the right to withhold that was a matter of law. He was inclined to agree, and if he had to decide it he would hold that the engineer could not withdraw the certificate. That being so, the plaintiffs would be entitled to the £1,500, and also something for tools, plant, &c., together with the amount of work they had done at the time of stoppage. On the other hand, the defendants claimed to deduct £735 for bad work.—The jury found for the plaintiffs with £2,544 damages. Judgment accordingly.

Builders' Notes.

The Wilts and Dorset Bank, Salisbury, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester stoves.

The Lancaster Master-Builders' Association held its annual meeting recently, when Mr. T. Mawson was elected president; Mr. H. Warbrick, Mr. G. Wright and Mr. R. P. Wilson, vice-presidents; and Mr. D. S. Cross, treasurer.

The Bricklayers at Walsall have struck work in consequence of an application for an advance of ½d. per hour and an alteration of rules, particularly with regard to overtime, having been refused. About 200 men are understood to be affected. It is stated that the employers have offered to submit the dispute to arbitration.

Berlin Carpenters Dispute.—It is feared that about 12,000 Berlin carpenters and workers in wood will be locked out. That number of men employed at woodcutting and dressing machines struck work a short time ago for better conditions of labour. The Association of Masters informed the men's union, however, that unless work were resumed under the old conditions on Saturday last they would be compelled to resort to strong measures. As the men have taken no notice of this ultimatum the masters are taking steps to dismiss them *en masse*.

Newcastle Stonemasons.—A largely attended meeting of Newcastle, Gateshead and Gosforth operative stonemasons was held last Tuesday week to consider the proposed code of amended rules put forward by the Newcastle and Tyne District Building Trade Employers' Association. The chief feature of the new code is that the masters desire the workmen to labour nine hours a day instead of eight in the summer months, and seven and a half hours from November 1st to February 1st in place of the seven hours now worked in December and January. The men decided unanimously to reject the whole of the new rules suggested.

The Bricklayers of Leigh, Atherton and Tyldesley, who threatened to strike because the masters had refused to advance wages from 9½d. to 10d. per hour, finally decided to withdraw their application for an advance of wages, and agreed to accept the proposal that in winter work should only be between light and dark.

A Dispute at Preston has occurred in the painting trade. In view of the Guild 8½d. per hour was conceded by the masters, but subsequently the state of trade did not justify the advance, and the masters gave six months' notice to revert to the 8d. rate. The men accepted the proposed reduction, but gave the necessary notice for an advance to 9d. to come into operation last week.

Strike of Belfast Painters.—A peculiar dispute has arisen in the Belfast house-painting trade resulting in the withdrawal of forty men from one of the largest concerns there. It occurred through a member of the National Amalgamated Society of Painters and Decorators refusing to become a member also of the local painters' trade union, which is a separate and distinct body, and the refusal of the employers to dismiss him.

The Horton Asylum: Great Excess over Estimate.—The excesses over the Horton Asylum are now engaging the attention of the London County Council. The building was undertaken by the Works Committee at £284,445, or £12,130 below the lowest tender (Messrs. Kirk & Randall's). A heavy loss is now reported. The actual cost of the work to the Works Department has been £330,500, or £39,500 over the architect's final estimate. In the opinion of the present Works Committee the causes to which this excess is due are—(*a*) Error of judgment on the part of the late manager of works in undertaking the work, and insufficiency of accepted estimate; (*b*) refusal of local authority to allow temporary railway for carriage of materials, &c.; (*c*) rise in prices of materials and in wages; (*d*) scarcity of labour. The Committee consider that the time of two years allowed for the erection of the asylum was too short, and that had the work been done by contract the quality of the work might have suffered.

Engineering Standards Committee: Government Grant. – The Treasury have expressed their willingness to include in the Board of Trade Vote for 1903–4 a sum of £3,000 as a contribution to the funds of the Committee for that year. After the sum has been voted by Parliament the actual expenditure under the vote will need to be authorized by the Board of Trade (Railway Department) on the recommendation of a committee appointed by the Institution of Civil Engineers. This committee will consist of the president and the senior vice-president of the Institution, Mr. James Mansergh, Sir John Wolfe Barry, Sir William Preece, Sir Benjamin Baker, Sir Douglas Fox and Mr. Archibald Denny, with a representative of the Board of Trade. The Engineering Standards Committee venture to hope that when the present vote is exhausted the Government will favourably consider the desirability of further assistance, as they attach very high importance to the necessity of organising a permanent body which shall keep in touch with the scientific and practical development of the trades concerned and be prepared to revise the standards by addition or deletion, and to modify the methods of testing as necessity may arise.

Fireproof Floors.– The Edinburgh Architectural Association held a meeting last week, Mr. Hunter Crawford presiding, when Mr. Frank Caws, F.R.I.B.A., of Newcastle-on-Tyne, gave an address on "Fireproof Floors and Construction." He pointed out that since the great fire in London, which caused quite a revolution in the substitution of brick walls for those of timber, there had been but very slow progress in fireproof construction. Latterly, however, the comparatively new material, Portland cement, had made fireproof floors a feature, the mode of construction of which permitted of great variation, and the practice of architects and experts showed wide differences in matters of detail. Generally speaking, said the lecturer, the introduction of steel girders as supports for the concrete had been carried to a very unwise excess, inasmuch as the action of fire upon the steel, causing it to expand, made it most injurious to the concrete floors, and, instead of being a support, it proved in such cases the means of their destruction. Therefore, he advocated a method of constructing floors in large slabs of concrete, with a minimum amount of steel bearers, so disposed and protected from the fire so as to give the necessary support without introducing an element of weakness. In closing, Mr. Caws described his own practical experience in buildings he had erected on the principle which he advocated.

Labour in the Colonies.—The Emigrants' Information Office, 31, Broadway, Westminster, S.W., state that this is the best season of the year for emigration to Canada, and there is an excellent demand for almost any kind of labour all over the Dominion. Emigrants should prepare to start at once. At Sydney, in Nova Scotia, there is a good demand in the steel and iron works and in the coal mines for general labourers, machinists, &c. Both in Nova Scotia and Ontario men, skilled and unskilled, are wanted for sanitary earthenware works and brickyards. The building trades are busy in all parts, and carpenters, bricklayers, plasterers and others are wanted. The metal trades are very busy in Ontario. In the Province of Quebec and in Ontario lumbermen have been very busy. In British Columbia the metal and building trades are fairly busy. In New South Wales and other Australian States the long drought has now, to a great extent, broken up; but it will be some time before its effects will have passed away. A report from Sydney states that the trade is very bad in New South Wales generally, as well as in Sydney itself. The engineering trade is very dull, and no more mechanics whatever are wanted. The building trades are better off owing to some Government works being in hand. There is no demand whatever for general labourers, wharf labourers or station hands. In other parts of Australia there is little demand for more labour, as the country is still suffering from the effects of the drought. In New Zealand there is a good demand for men in the building trades at Auckland, Christchurch, Dunedin and other places. In Cape Colony there is a demand for plasterers, bricklayers, carpenters and first-class painters. The cost of living is high. In Natal a good deal of work is going on in the building and other trades, but the local supply of labour is generally sufficient, though specially skilled men, if they land with a little money, should be able to procure work without difficulty. Wages are high, but the cost of living is high also. There has been a strike of bricklayers at Durban. Permits are still required by those proceeding to the Transvaal and Orange River Colony; they are not issued in this country, but must be applied for at the Permit Office at the Port in South Africa at which the emigrant lands. In the building trades at Johannesburg materials are coming up from the coast somewhat more quickly, and consequently men in those trades have been better employed, but a good many are still out of work. Shop and office fitters have been well employed. In the Orange River Colony there is a fluctuating demand for good carpenters, masons, fitters and painters. The cost of living is very high.

Keystones.

The R.I.B.A. and Registration.—Some sort of an official declaration against architectural registration is given in the R.I.B.A. "Journal" for April 4th. We hope to deal with it in our next issue.

Extension of Woolwich Arsenal.—It has been decided to enlarge Woolwich Arsenal, and for that purpose a large tract of land on Plumstead Marshes, lying between the present Arsenal boundary and the London County Council outfall sewer, is to be acquired at a cost of about £80,000.

"**Ventilating and Warming.**"—In the first part of this paper by Mr. B. R. Tucker published in our issue for March 25th a printer's error occurs in the third column of p. 84, line 12, where it is obvious the word "not" is a mistake. Air supplied by the plenum system can of course be filtered, washed, warmed or cooled, as desired.

A War Memorial Competition.—Over 100 designs were sent in for executing and erecting a war memorial at Chester-le-Street. The design selected is by Messrs. James Bennett & Son, Commercial Street, Birmingham, and is in the form of a granite obelisk over 15ft. high, the details being suggestive of the purpose for which it is intended.

Dissolution of Partnership.—The partnership existing between Mr. Frederick Wheeler, F.R.I.B.A., of 6, Staple Inn, W.C., and Horsham, and Mr. Percy Dean Lodge, F.MAN S.A., of Horsham, practising in Sussex as Frederick Wheeler & Lodge, architects, Bank Chambers, Carfax, Horsham, was dissolved on March 31st last. The practice will now be carried on solely by Mr. Frederick Wheeler at both the above London and Horsham addresses.

The Statue of the late Mr. Gladstone which Parliament authorized to be placed in Westminster Abbey, and which has been executed by Mr. Brock, R.A., has been erected in the north transept under the direction of the sculptor. It is of white marble and is erected on a marble pedestal. The deceased statesman is represented standing, wearing the gown of a D.C.L. of Oxtord University, and with his face turned slightly to the left towards the choir.

Sir W. Abney retires.—In the Architectural School of the Royal College of Art, South Kensington, last Wednesday, a bronze bust of Sir William Abney, by Professor Lantéri, was presented to Lady Abney on the occasion of the retirement of Sir William Abney from the principal assistant-secretaryship of the Board of Education, South Kensington. Sir John Gorst, M.P., in making the presentation, spoke of Sir William Abney's services in the development of the Royal College of Art. The whole of the merit for the change which had been brought about in the department, he said, was due to the work of Mr. Spencer and Sir William Abney; and the institution was now one of which the country might be proud.

Caerphilly Congregational Church Competition.—Clause 7 of the conditions of this competition states that the successful competitor will be paid 5 per cent. for all the "usual professional services of an architect," including the taking-out of quantities. The Cardiff, South Wales and Monmouthshire Society has been endeavouring to get this clause modified, and the R.I.B.A. addressed a letter to the promoters on the subject; but the answer given is a blank negative. The promoters have now issued to intending competitors what purports to be a copy of the correspondence between themselves and the Cardiff Society, but *with no reference whatever to clause 7!* The Institute hope that none of their members will enter for the competition.

A new Fire Station has been erected in Blackstock Road, Highbury, N.

Notre Dame, Paris, is to be lighted by electricty.

The Height of "Sky-Scrapers" in America can be legally restrained to 90ft.

A new Board School at Coatbridge has been erected at a cost of £7,000. Mr. James Davidson, Academy Street, Coatbridge, was the architect.

St. John's Wesleyan Methodist Church, Glasgow.—Mr. James McKissack informs us that this church (illustrated on p. 99 of our last issue) was designed by his father and Mr. Rowan when partners, not by Mr. Rowan alone.

A Donatello discovered.—Professor Bonola has discovered at Florence an original bas relief of Saint Cecilia by the Italian sculptor Donatello, of which a similar work in the British Museum, London, is said to be merely a copy.

Mr. Bertram Blount, F.I.C., F.C.S., announces that owing to the death of his late partner, Mr. W. Harry Stanger, M.I.C.E., F.C.S., the firm of Stanger & Blount, chemical laboratory and testing works, is dissolved. The business is being temporarily conducted at 2, Broadway, Westminster, but at an early date Mr. Blount will remove to other premises in Westminster.

The Edinburgh Architectural Association recently visited Darn Hall, near Eddleston. Permission for the visit was kindly granted by Lord Elibank and Mr. John R. Menzies. The house, which dates from about the end of the seventeenth century, occupies an elevated and secluded position in a romantic glen. The surrounding grounds have been laid out with great taste. The place was originally known as Haltoun or Blackbarony. The party was under the leadership of Mr. Thomas Ross, architect.

A Liverpool Competition.—At the Liverpool City Council meeting last week the award of Sir William Emerson was read on the seventeen plans sent in for baths, tramway offices and general offices, which the Council proposes to erect on the old site of the George's Dock at the Pierhead. The cost of the scheme has not yet been ascertained, but the baths especially are to be among the most extensive in the country. The awards were as follows:—(1) Stones & Stones, Blackburn, and W. E. Sproat, Glasgow, jointly; (2) Briggs & Wolstenholme, Liverpool; (3) Huon A. Matear, Liverpool, and Simon & Crawford, Liverpool and Manchester, jointly. The successful plans are to be exhibited at the Walker Art Gallery. The adjudicator suggests that an open space be left around the buildings, especially the baths, as on the Continent, so as to provide a fresh current of air across, and says that if this were done he would be inclined to recommend the first prize to the third firm, provided also they were a little stronger in their architecture.

Obituary.

Mr. James Carter, F.G.S., of Granville Road, Blackburn, died last week at the age of sixty-one years. Mr. Carter was the principal partner of the well-known firm of Messrs. James Carter & Co., coal, lime and cement merchants, of Blackburn, Clitheroe and Chatburn. Mr. Carter was born at Kendal, but going to Lancashire when still a young man, he entered into partnership with Mr. Rowe, at Darwen, this being about the year 1867. The business soon grew, one result being the establishing of the Bellman Park and Salthill Lime Works, Chatburn and Clitheroe, and, later still, the founding of branch offices at Fleetwood and Blackburn.

Complete List of Contracts Open.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
		BUILDING:		
April	9	Huddersfield—Four Shops	Industrial Soc., Ltd.	J. Berry, 3 Market Place, Huddersfield.

Bankruptcies.

[Abbreviations: R O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver.]

During the week ending April 4th seven failures in the building and timber trades in England and Wales were gazetted.

H. Hudspith, builder, Gateshead. Liabilities £67.

C. Butler, builder, 20, Bucklersbury, London. Liabilities £469; assets £46.

Pennick & Taylor, builders, Clacton-on-Sea. R.O. March 27th

M. S. Johnson, builder, 58, Kirkdale, Sydenham. R O. March 24th.

F. E. Nicholson, varnish manufacturer, Hull. P.E., Hull C.C., April 27th, at 2.

J. O. Bower, builder, Aberfan, Merthyr Tydfil. P.E., Merthyr Town Hall, May 6th, at 3.

M. & J. Keane, builders and contractors, Maesteg. R.O. March 23rd.

J B. Brez, builder and contractor, late of Weaste. Liabilities £434; deficiency £245

Lummis & Son, builders, Chelmsford. Liabilities £1 443; assets £971.

W. Purkis, builder, Braintree. Liabilities £5,540 5s.; £51 expected to rank; estimated surplus £229 9s. 3d.

A. Ventris, builder, Great Wakening. Liabilities £395; £163 5s. expected to rank; deficiency £130 6s.

C. Cooper & Co. stone merchants, 47 and 48, King William Street, London. P.E, Bankruptcy Court, May 6th, at 11.30

C. Stotter, brick manufacturer, Enfield. First meeting, O.R.'s, 95, Temple Chambers, London, April 8th, at 12. P.E., Edmonton C.C., May 4th, at 11.30.

J. Ashby, builder, Lowestoft. First meeting, O.R's., Norwich, April 8th, at 3. P E., Yarmouth Town Hall, April 21st, at 11.

N. W. K. Godard, builder, Aldrington. First meeting, O.R's., Brighton, April 8th, at 11. P.E., Brighton C.C., April 29th, at 11.

F. J. Rayner, contractor, Slinfold. R.O. March 24th. First meeting, O.R's., Brighton, April 9th, at 2 30. P.E, Brighton C.C, April 29th, at 11.

A. Taylor, surveyor, St. Andrew's Road, Brighton. R.O. March 24th. First meeting, O.R's., Brighton, April 8th, at 4.30. P.E, Brighton C.C., April 29th, at 11.

J. W. Radnedge, builder. Merthyr Tydfil. First meeting, 135, High Street, Merthyr, April 9th, at 12. P.E., Merthyr Town Hall, May 6th, at 3.

G. Merredew, joinery manufacturer, Kingston-on-Thames. First meeting, 24, Railway Approach, London Bridge, April 9th, at 11.30. P.E, Kingston C C., May 5th, at 2 30.

T. Harris, late a builder at Fazakerley, near Liverpool. A first and final dividend of 6s. 3d. in the £ has been paid on debts amounting to £524. Discharge suspended for two years last week.

A. Neesom, builder and contractor, 14, Marley Road, Levenshulme, late of Chorlton-cum-Hardy. First meeting, O.R's., Manchester, April 8th, at 2.30. P.E., Salford C.C., May 5th, at 10.30.

R. S Buckeridge, builder, Harrow Road, London, W. Liabilities £8,213; assets £3,677. Failure attributed to bad debts law expenses, losses through accidents, and high price of labour and materials. P.E., Bankruptcy Court, April 29th, at 11.30.

W. Thompson, builder. 81, Bishopsgate Street, London. E.C. Liabilities £2,128; assets £10. P.E. concluded March 31st. Failure attributed to loss on contracts due to under-estimating; neglect of work by a foreman; and heavy litigation in respect of a building speculation in Marylebone.

Godfrey & Liddelow, civil engineers and contractors, Victoria Street, Westminster. The firm was established in 1889, mainly to carry out a large contract with the Greek Government for the construction of the Piræus and Larissa Railway. The sum of £80,000 was deposited as caution money, and the works were proceeded with, but difficulties arose, and eventually the Greek Government seized the property and works and declared the caution money forfeited. The total amount claimed to be due to the firm in respect of the contract was £453 605 6s. 4d., and to the refusal of the Greek Government to pay the same the bankrupts attributed their failure. It was reported that the assets were not equal to 10s. in the pound, and that the applicant has continued to trade after knowing himself to be insolvent. The Registrar last week suspended the order of discharge for two years.

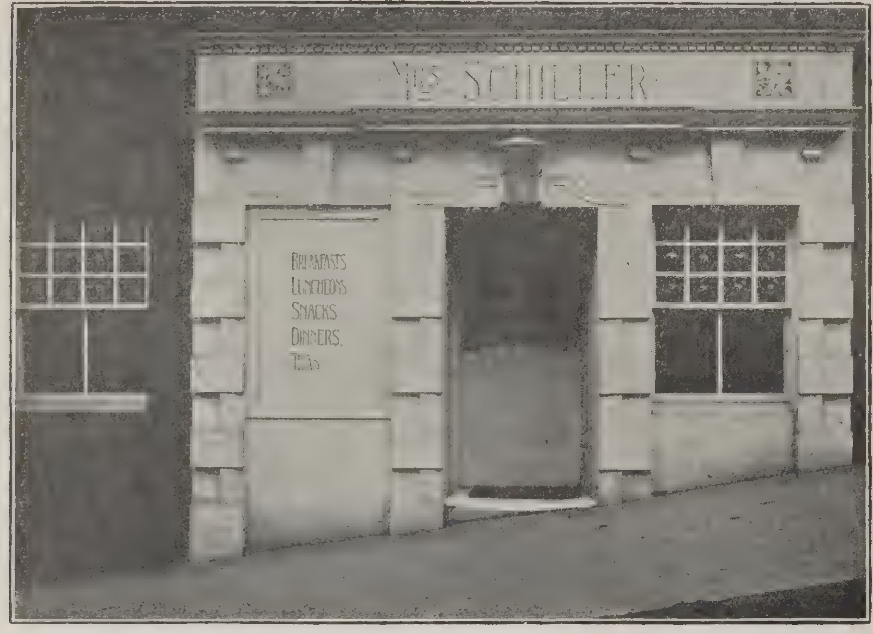
THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

April 15, 1903. Vol. 17, No. 427.

9, East Harding Street, E.C.

The R.I.B.A. and Registration. The circular issued by the Society of Architects, headed "A Government Diploma for Architecture," has drawn from the Royal Institute some sort of an official declaration against architectural registration; but the arguments advanced can hardly be called conclusive. We readily appreciate that the scheme has its defects—grave defects, perhaps—and we cannot feel equally zealous as the promoters express themselves to be; still, looking at the present condition of things, it would seem to be the lesser of two evils. The Institute "pronouncement" takes the form of a memorandum sent to the presidents of the allied societies. "In the event of any further steps being taken towards legislation in the matter, the Council will be prepared on learning the particulars to forward an amplification of their views." Meanwhile the presidents are desired to ascertain the general opinion of their societies, and afterwards to meet Mr. Aston Webb in conference "on matters vitally affecting the interests of architecture throughout the country." It is asked in the memorandum what chance there would be of passing the measure if it meant that engineers must design no more bridges or railway stations, and surveyors no more buildings on the estates they manage; and also, how legal registration could decide who should call himself an architect and who not. But, as we understand the scheme, it is clear that only those persons would be allowed to practise as architects who had passed the official examination: it would make no difference if a man were an engineer as well, while, as to surveyors, any measure is to be welcomed which is in the least likely to improve the type of house generally spluttered over "estates"—and we recollect that the Institute is itself particularly anxious that borough surveyors and engineers should not be given the architectural work of their towns. It is of course impossible to examine a man in his "art," but if we believe that a study and knowledge of past styles, past construction, past decoration, are essential to everyone who professes to be an architect, and that such study is conducive to an improvement in taste, then we must see that "surveyors" who undertook architecture would be the better for such training. The memorandum continues: "Architecture claims to be one of the liberal arts, akin to the art of the painter, the sculptor and the musician; and if they do not seek protection from the charlatans in their respective arts, why should we?" Architecture, however, is vastly more permanent than those arts, dealing with essential solidities: and it is not so much the charlatan as the incompetent practitioner who inflicts the most harm. The Institute suggests that if legislation is needed to protect the public from bad construction it should be directed against the speculative builder, who should be required to pass a building examination: while, "if the idea be to protect the public against bad art, can can any legal registration do this?" But, looking at the facts, how could speculative builders be required to pass any examination?—they are generally ignorant money-makers, and the strict administration of the by-laws is the only thing to which we can look for any remedy at present. It seems to us that the Institute, not having started the scheme itself, will not consider it without prejudice. We regret that this is so, as architectural registration can never hope to receive Parliamentary assent without its support. Maybe something will result from the forthcoming conference.

St. Mary Aldermary. We hardly expect to find Gothic in the City. A few days after the Great Fire "Doctor Wren" ascended the tower of St. Saviour's Church in Southwark and, looking upon the still smoking ruins on the northern bank, he sketched out a city which he intended should be wholly Palladian. Custom and tradition, however, were too much for him in many places: Gothic lingered in England after it died out elsewhere; it is found with Classic or Renaissance details in what is called "Oxford Gothic," also in a species of quasi-Gothic detail here and there, and can be clearly distinguished from the Gothic Revival of a later date. The English people were loth to part with their traditional architecture, and public opinion, influenced by sentiment and association, insisted upon more than one Gothic design from the hands of the great master of "Italian." To this cause we owe a few buildings in London, Oxford and elsewhere which are quite anomalous in style but saved by some intrinsic merits from failure or ugliness. One of the best of these is St. Mary Aldermary, a church one flank of which has been "disengaged" by the creation of Queen Victoria Street, the west door being entered from Bow Lane. Tradition asserts that after the fire the parishioners demanded that their new church should be as nearly as possible a reproduction of the one just burnt; this is not improbable, but another reason may have had even greater weight with the king's Surveyor-General, that the fabric was far from consumed; the tower, a very fine one, lofty and well-proportioned, still stood, and had only been scorched and blackened by the flames; the nave, too, was but slightly injured, and the problem was one that must have appealed to the architect's well-known ingenuity. St. Mary's, indeed, is not the only building thus treated by him; how little it is remembered that his first work at St. Paul's was to patch up the ruins of the cathedral into a temporary structure, which was actually used for eight or nine years. St. Mary Aldermary's consists essentially of a nave and two aisles, separated by very slender clustered shafts, with flattened slightly-pointed arches: smaller shafts proceed up the face of the clearstory, and from these spring a succession of elaborate fan vaultings, or, more correctly, ceilings so worked, mainly in plaster; the centre of each—where a carved stone boss or possibly a pendant would be found in a Tudor church—is a circular panel, with deeply indented ornament, and surrounded with elaborate mouldings; shields and foliage enrich the spandrels; the aisles are similarly treated, though the ornament is even richer and the centre panels are oval, two of them being used as skylights. The detail is somewhat artificial and would be condemned by purists, but the verdict upon the work as a whole is "justified by success." It is not necessary here to consider whether Gothic fan-vaulting may be reproduced in ceilings of wood and plaster; it is better to accept the undoubted fact that the interior is one of the most beautiful in the City; it is finely proportioned, and there is an air of width and spaciousness about it when viewed from the west door which is very impressive. As usual in the churches of this period there is a wide and stately ante-chapel. The details of the seating, the fine organ and general sense of rich ornament surprise the visitor who sees it for the first time. The exterior is dignified; the great tower, in four storeys, 135ft. high to the finials, probably dates from 1632, and is itself an example of a Gothic survival, for at that date Palladian had practically superseded mediæval forms. It is much to be hoped that this fine church may not be sacrificed like so many of its neighbours (in several instances without any just reason), and its site covered with a block of offices and business premises.



DOORPIECE, WEST CAMPBELL STREET, GLASGOW. W. G. ROWAN, I.A., ARCHITECT.

SOME RECENT GLASGOW TEA-ROOMS.

By J. JEFFREY WADDELL.

A RECENT writer[*] says, "It is not the accent of the people, nor the painted houses, nor yet the absence of Highland policemen, that makes the Glasgow man in London feel that he is in a foreign town and far from home. It is a simpler matter. It is the lack of tea shops." Glasgow, in truth, is a very Tokio for tea-rooms. Nowhere can one have so much for so little, and nowhere are such places more popular or frequented.

And these tea-rooms are, as a rule, as interesting from an artistic and architectural point of view as they are useful. In most cases they are ingenious adaptations of old buildings or parts of buildings to modern requirements, so that many cellars which were formerly used for storing lumber are now well-ventilated smoking-rooms, brilliant with electric light and as comfortable as most homes. One or two occupy specially-constructed buildings, such as that erected for Miss Cranston by Mr. George Washington Browne, but as a rule they are of the former class, adaptations to modern requirements.

The tea-room in Glasgow is associated with the New Art movement. Of course, the element of cost enters into the construction and adaptation of these rooms; very few architects get an entirely free hand, and one hears many complaints of what the architect is expected to do for half what should really be the cost. But this in moderation is a valuable training for an architect. He who has schooled himself with cheap material can make good use of his opportunity when it comes. And while it is not pleasant to see a man capable of better things using inferior material, it is still worse to see—what is all too common—the most costly material wasted by injudicious application.

One of the most notable of these recent reconstructions in Glasgow was that done for Mrs. Schiller, West Campbell Street. These premises, originally the basement of a three-storey dwelling-house, have for some years past been used as tea-rooms, but recently they have been enlarged and greatly improved by Mr. W. G. Rowan.

A new door-piece has been erected which gives due importance to the entrance. It is of wood, painted ivory-white and enriched with stencils of the thistle and the rose, a lamp in broad leaded work and a hammered-metal door-plate. The simple lines and effective rustication of this door-piece add greatly to the appearance of this otherwise plain ashlar basement. Although Mr. Rowan alludes to work of this type as "billposter architecture" (he is known chiefly as a church architect), it has more legitimate uses than even the most artistic *affichier* can claim for his own art.

Mr. Rowan's interiors are treated simply. Square tapering wooden posts conceal the spidery cast-iron columns within, and give an architectural dignity to the rooms. The fireplaces are tiled and have simple polished-iron grates. The sideboard in the general dining-room is very effective, yet simple in its general lines.

The smoking-room is a successful piece of work, restrained and refined in feeling. Great effect is gained by the use of a tapestry frieze which harmonizes very well with the rest of the design. The ladies' room has the same general character as the general luncheon-room, though with its own individuality in detail.

The premises occupied by the Old Oak Tea-Rooms have the advantage of being new and not reconstructed premises. These rooms form the street floor of one of Glasgow's most modern street fronts, a steel construction by Messrs. James Salmon & Son.[*] The name of this tea-room is justified from the fact that the rooms are furnished with upwards of seventy old oak chairs, settles and cabinets, many of which are very good specimens of old workmanship. The general luncheon-room extends to the full depth of the building and is lit from the front by a large oriel and from a well at the back. The illustration on p. 132 shows a general view of the room looking towards the back of the building. The detail of the capitals is modern, but Byzantine in feeling. The stencilled decoration is very delicate in colouring. On p. 130 one of the ingle-nooks, with its old-fashioned fittings, is shown.

The Regent Tea-Rooms are also situated in a fine new building, the architects of which were Messrs. Burnet, Boston & Carruthers. They occupy the major portion of the first floor.

The general luncheon-room is a large and spacious L-shaped apartment having two fireplaces (one of which is reproduced on the opposite page): they are pleasing in design and are enriched with decorative paintings. The fittings throughout are of oak.

The tea-rooms of Miss Cranston in Buchanan Street (illustrated in the centre plates), though not what might strictly be termed recent, are worth more than a passing notice. As already mentioned, they were specially designed by George Washington Browne, A.R.S.A. The building is four storeys high, the front being of red and white sandstone. On the ground or street floor are the ladies'-room and general tea-room, the first floor being occupied by two other tea-rooms. On the second floor are the luncheon- and dining-rooms. The top floor is occupied by the billiard- and smoking-rooms. The rooms to the front are lighted from the street, those to the back from a central roof-light and well. A passenger elevator, as well as a staircase, connects all the floors. The building is very handsomely fitted, but two styles are observable: that of the architect of the building, and that of Mr. Charles R. Mac-

FIREPLACE, REGENT TEA-ROOMS, GLASGOW.

intosh, who, together with Mr. George Walton, is responsible for the decoration and furnishing. The mural decoration is very original and striking.

Miss Cranston's tea-rooms in Ingram Street are adaptations of old premises to this purpose. For some years a portion of these rooms has been used by Miss Cranston, but quite recently a new ladies'-room, billiard-room and general tea-room have been added by Mr. Macintosh. In these tea-rooms he had an opportunity which has been admirably utilized. The ladies' room is finished in ivory white, and has an immense hobbed fireplace of sheet-iron decorated with opalescent glass. Two panels in coloured plaster occupy the frieze on opposite sides of the room—the one by Mr. Macintosh, the other by his wife. This room may be seen to best advantage from the gallery which runs along the side and end. The billiard-room is in the basement. Here the same New School treatment has been employed with great success. Everything is direct. The timbers of the ceiling are exposed, and the settles along the wall are simply rush-bottomed; yet the effect is distinctly artistic.

The largest tea-room reconstruction of recent years is that for Miss Cranston in Argyle Street, Glasgow. The front, which was formerly one of the most commonplace, had all its mouldings hewn off and was then rough-cast from the eaves to the signboard. The gables and dormers were fancifully treated, and a turret—red-tiled, like the roof—was erected. There are two entrances, the one shop-like, which serves for the ground floor, and the other a *pend close* which leads to a turret stair at the back of the premises. An inside stair is also provided. The ground floor is occupied by the tea-rooms, the first and second floors by luncheon- and tea-rooms, and the top floors by billiard-, smoking- and reading-rooms. The interior is fitted and furnished in the New School style which Miss Cranston has adopted in all her tea-rooms, in some cases with delightful results. The shop entrance with its flat oriel and simple wrought-iron and repoussé copper fittings is very pleasing in its effect, as are also some of the fireplaces and ingles.

The doorway to the newel stair, and the billiard-room, are both examples of good design. The building generally shows what can be done in reconstructing, from the most commonplace of buildings, rooms to suit the most modern requirements and the most artistic tastes. The architects of the building were Messrs. H. & D. Barclay.

SOMERSETSHIRE CHURCHES.

SOME SPECIAL AND DISTINCTIVE FEATURES.

By **HENRY CAYLEY, A.R.I.B.A.**

I AM going to deal mainly with three special features of the churches of the West of England—(1) a particular type of Early English work which is found in Somersetshire and neighbouring counties, (2) the famous Perpendicular western towers of Somersetshire churches, and (3) the details of woodwork in the rood screens of that district.

Of the special kind of Early English work we find examples at Glastonbury and Wells; though its peculiarities are not confined to those two places, but exist elsewhere in the West of England and South Wales, especially at Whitchurch in Somersetshire, Slimbridge in Gloucestershire, and Cheriton in the Gower peninsula in Glamorganshire. The special character of the work is a kind of Early English intermediate between ordinary Early English and French First Pointed. It retains everywhere the abacus square or octagonal on plan, as French work does; but the arch mouldings and the foliage on the capitals, while they have characteristic peculiarities of their own, are quite English and not at all foreign. In this they do not resemble the well-known capitals of the choir arcade at Canterbury attributed to William of Sens and William the Englishman, which, though not without some variations in an English direction, are to all intents and purposes French in character, and are either of the Byzantine character found in Sens Cathedral or of the type found in Notre Dame, Paris. These capitals always have one large leaf under the principal angle and a smaller leaf at the middle of the side, and the arrangement of the leaves and stalks is almost as regular as in a Corinthian capital. At Wells the foliage is arranged much more freely and more in the manner of ordinary Early English work. I cannot agree with a writer who maintains that this square abacus work at Wells suggests Canterbury influence. I think the character of the work at the two places is quite different.

St. Mary's Chapel at Glastonbury (an example of purely Transitional work) was originally detached from the church, standing to the west of it (the date of the dedication is said to be 1186). The other parts of the church are later: the considerable remains at the crossing are later Transitional, and the galilee was built in Early English times to connect St. Mary's Chapel with the west end of the nave. The chapel has some peculiar forms of zigzag which are seen further developed in the north porch of Wells. The piers at the crossing of Glastonbury and the galilee are pure Early English, but retain in one or two places the square abacus used much more extensively at Wells.

The works which I shall especially consider at Wells include the main portion of the building, *i.e.*, the nave, transepts and the three western bays of the choir. The date of these portions has been the subject of a good deal of controversy, but as far as I can judge all the visible architectural *features* must belong to the period of Bishop Jocelin (1206–1242). I cannot follow Canon Church, the latest writer on the subject, especially in view of the date of the work in the neighbouring church of Glastonbury, in referring any of the details to Bishop Robert (1136–1166) or Bishop Reginald (1174–1191), though very likely some of the plain masonry belongs to a date earlier than Jocelin.

The west front, though also almost certainly of Bishop Jocelin's time, does not

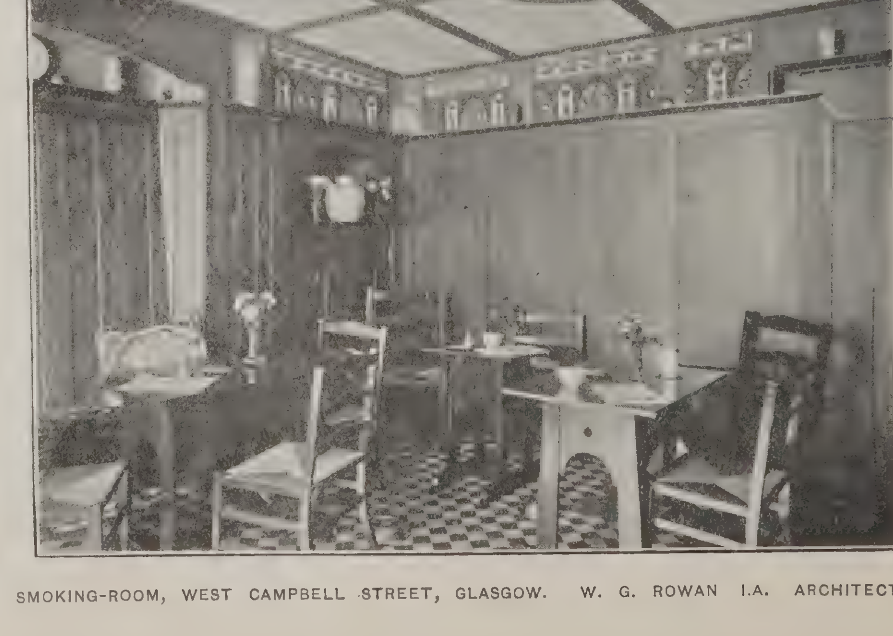
LADIES' ROOM, WEST CAMPBELL STREET, GLASGOW.

exhibit the peculiar character of the nave and the other parts I have mentioned; it is best known for the magnificent sculpture it displays; as an architectural composition it has been justly criticised as not representing the church behind it, and condemned for the insignificance of its doorways. Its details are not to be distinguished from the Early English details of Salisbury or Lincoln; there is an abundance of marble shafts; the round abacus is used throughout. In the nave we observe a lingering Romanesque character in the plan of the piers and in the absence of detached shafts, though I think you will agree that the foliage and mouldings are developed Early English.

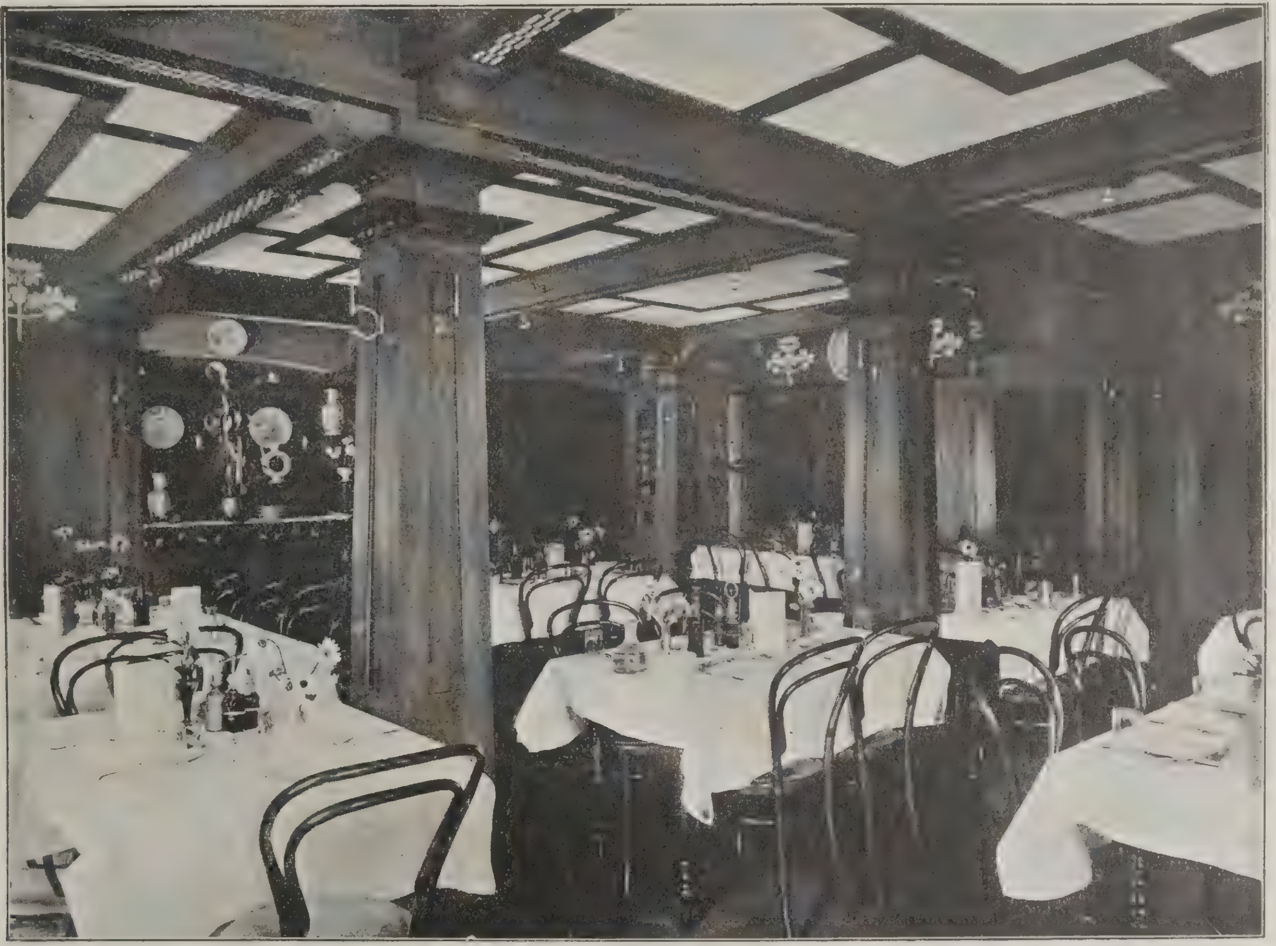
I have made a special study of the north porch (see the BUILDERS' JOURNAL for March 25th, 1903). This agrees with the nave in everything except that there is an abundant use of detached shafts (of Doulting stone, however, like the rest of the work, not of marble). The work is very elaborate, and the deeply-recessed second tier of arcading and the deep hollows of the mouldings produce a striking effect. I would call attention to the very ornate forms the zigzag has put on in the elaborate outer door; the capitals on the left-hand side of the door are said to represent the martyrdom of St. Edmund. And you will see here the special features of the work—the square and octagonal abaci and the stiff-stalked but irregular foliage of the caps. I need hardly remark that the pierced parapet, which runs round both aisle and clearstory walls, is a Decorated addition, and that the pier in the centre of the inner doorway is a Perpendicular insertion probably contemporaneous with the tracery inserted in the Early English windows.

The Perpendicular church towers of Somerset are our next subject. One of my principal sources of information has been Freeman's paper on the Perpendicular of Somerset, published in the 1851–2 Proceedings of the Somerset Archæological and Natural History Society. At the beginning of it he finds himself obliged to defend the towers of Somerset against some criticisms of Mr. Ruskin. Both the quotations from Mr. Ruskin and Freeman's answer are so amusing that I think them worth giving, though I suppose, fifty years later, those who read Ruskin enjoy his writings without treating him as an inspired and infallible guide. Mr. Ruskin inveighs against pinnacles and buttresses; pinnacles are in the following passage found to be offenders against the "Lamp of Beauty." "I believe," he says, "that all that has been written and taught about proportion put together is not to the architect worth the single rule, well enforced: 'Have one large thing and several smaller things, or one principal thing and several inferior things, and bind them well together.' Sometimes there may be a regular gradation as between the heights of storeys in good designs for houses; sometimes a monarch with a lowly train, as in the spire with its pinnacles. The varieties of arrangement are infinite, but the law is universal—have one thing above the rest, either by size or office or interest. Do not put the pinnacles without the spire. What a host of ugly church towers have we in England with pinnacles at the corners and none in the middle! How many buildings, like King's College Chapel at Cambridge, looking like tables upside down with their four legs in the air! What, it will be said, have not beasts four legs? Yes, but legs of different shapes, and with a head between them. So they have a pair of ears and perhaps a pair of horns—but not at both ends. Knock down a couple of pinnacles at either end in King's College Chapel, and you will have a kind of proportion instantly." Mr. Freeman calls this passage a good sample of Mr. Ruskin's diction and logic; and goes on to say: "The real question is, what have either the monarch or the table, to say nothing of the horses, goats, camels or hippopotami, which come after them, to do with St. Cuthbert's tower at Wells and King's College Chapel? Herein lies the great force of Mr. Ruskin's style of logic. He puts two things together by an arbitrary juxtaposition and then expects you, first of all, to accept the juxtaposition as an analogy, and finally to accept the analogy as an argument. What has a monarch and his lowly train to do with it? Why may I not in the nineteenth century erect, if I think good, a thoroughly republican steeple? Why may I not, if I choose, like some of my friends, to symbolize ecclesiastical facts, terminate my tower with the four Doctors of the Church, or even with the Twelve Apostles . . . . Again, he tells us, 'What, it will be said, have not beasts four legs?' By whom will it be said? Could the idea enter into any man's head but his own, that the legs of beasts prove anything, either way, as to the beauty of King's College Chapel. I am fully aware that beasts have four legs, just as other members of the animal kingdom have two, six, eight or a hundred; but I am too blind to see how any architectural principle can be deduced from this most indisputable fact. And as for the beasts 'with legs of different shapes and with a head between them,' I much doubt whether the deserts of Africa or the sculptures of Nimroud exhibit anything half so marvellous. I must appeal to the Natural History section to inform me whether any such are to be found in Nature."

Another piece of Mr. Ruskin's declamation refers to buttresses. He begins, "There must be no light-headedness in yonder noble tower; impregnable foundations, wrathful crest, with the vizor down, and the dark vigilance seen through the clefts of it; not the filigree crown or embroidered cap. No towers are so grand as the square-browed ones with massy cornices and rent battlements . . . But in all of them this I believe to be a point of chief necessity—that they



SMOKING-ROOM, WEST CAMPBELL STREET, GLASGOW. W. G. ROWAN I.A. ARCHITECT.



LUNCHEON-ROOM, WEST CAMPBELL STREET, GLASGOW. W. G. ROWAN, I.A., ARCHITECT.

shall seem to stand and verily shall stand in their own strength, not by help of buttresses nor artful balancings on this side or that. Your noble tower must need no help, must be sustained by no crutches, must give place to no suspicion of decrepitude. Its offices may be to withstand war, look forth for tidings, or to point to heaven, but it must have in its own walls strength to do this; it is to be in itself a bulwark, not to be sustained by other bulwarks; to rise and look forth 'the tower of Lebanon that looketh towards Damascus' like a stern sentinel, not like a child held up in its nurse's arms. A tower may indeed have a kind of buttress, a projection or a subordinate tower at each end of its angles: but these are to its main body like the satellites to a shaft, joined with its strength and associated with its uprightness, part of the tower itself: exactly in the proportion in which they lose their massive unity with its body, and assume the form of true buttress walls, set on at its angles, the tower loses its dignity."

"Now," asks Mr. Freeman, "what in the name of common-sense and common English does all this mean? If Mr. Ruskin thinks Magdalen College tower, Oxford, better than Wrington in Somerset or Titchmarsh in Northamptonshire, let him; it is a fair question of taste, on which we may differ quite comfortably; but why all this rant and dogmatism? What is 'light-headedness' in a tower? What is 'wrathful crest'? The glossary fails to inform me what is meant by 'square-browed towers' and 'rent battlements,' unless, indeed, a tower cannot put in a claim to 'nobility' till its parapet has been damaged by a thunderstorm. Finally, *why* is all this? Why cannot our buttressed tower do all these fine things? Why cannot Taunton tower 'rise and look forth,' &c., &c.; though as I do not know the form of 'the tower of Lebanon,' which I believe the royal lover likens to the nose of his bride, I cannot profess to say which of our Somersetshire types departs furthest from that ideal. To come to the main issue, I can, of course, only dogmatize back again; if I say 'there should be no top-heaviness in your noble tower,' I feel quite sure of being right; if I say it should have its vizor up, though I do not know what that means, I think probability is on my side, inasmuch as I am asserting the contrary to Mr. Ruskin; and I lastly solemnly affirm that what Mr. Ruskin says about 'crutches' and 'bulwarks supported by other bulwarks' is simply a specimen of his false analogies."

Whether you agree with Mr. Ruskin or not, I expect you will admire some of the towers I am now going to deal with, even if they are buttressed and have four equal pinnacles. The tower of Shepton Mallet Church illustrates most of the points I shall mention. The unfinished spire on this tower is a curious feature, which, of course, is not common, though there are several in the West of England and very few elsewhere; while the district is one where finished spires are very rare in proportion to the number of mediæval churches. I will first ask you to observe the treatment of the angle, considering it from the pinnacle downwards. The pinnacle is often placed diagonally, as here, stopping the parapet and running down so as to give a starting-point for the buttresses; we generally have two buttresses placed each a little away from the angle so that it can be seen between them; the use of the diagonal buttress is very uncommon. Pinnacles are often used at this uppermost set-off of the buttresses, and in some of the other towers are small pinnacles grouped around a principal one and pinnacles at all the set-offs of buttresses. The single pinnacle at the corner will serve to distinguish our type of tower from the Greyfriars tower at Richmond, Yorkshire, which has often been said to resemble the Somersetshire towers, and which has two pinnacles at each corner, each belonging to its own buttress; the same peculiarity apparently existed in the late tower at Fountains Abbey when it was complete.

Turning to the side elevation of the tower, we begin at the top with a pierced parapet, more often battlemented than having the horizontal line of this one: the wall face below is ornamented with sunk panelling in the form of window tracery and buttresses of slight projection, kept subordinate to the panelling, *not* with panelling of other than window-tracery form, as in the tower of Cirencester, Gloucestershire; *not* as in the central tower of Gloucester Cathedral and other towers taking their *motif* from that, with the small buttresses and decorative canopies and pinnacles projecting so far as to give them something of an appearance of ironwork nailed on to a solid stone tower; while the depth of the sunk panelling is sufficient to give considerable light and shade, and in that respect differs from Norfolk and Suffolk towers, which, fine as they are, have a flatness due to the method of construction itself, a consequence of the flint that is the local material there.

It is usual, though Shepton Mallet does not illustrate this point, to have a pinnacle subordinate to the angle pinnacles centrally between them and to continue it down as a buttress, so as to divide the belfry storey vertically into two at least.

The Somerset towers may be divided into

INGLE, OLD OAK TEA-ROOMS, ST. VINCENT STREET, GLASGOW.

three principal classes. St. Mary's, Taunton, belongs to a class where the tower is divided horizontally into several divisions and the belfry stage is less than a third of the whole height of the tower. It is true the divisions are not as prominent as in such a tower as Titchmarsh in Northamptonshire, the string-courses being stopped by the buttresses instead of running round them. There is generally a projection at one angle for the staircase, but prominence is not given to it, as that angle, like the others, has two buttresses, and the staircase finishes either just below or some way below the parapet level, or, at any rate, so that the pinnacle at that corner resembles the others. Of this class are Bishop's Lydeard, Chewton Mendip and North Petherton.

The second class is not very different, but more prominence is given to the staircase excrescence; it has no buttresses on its faces, as at Dundry; or it is continued up to form a turret, overcrowing the other pinnacles, as at St. James's, Taunton. Both these features are present in other churches, and the class is specially characteristic of Bristol and its neighbourhood. St. Stephen's, Bristol, is scarcely a characteristic Somersetshire tower, owing to the absence of real buttresses, but of this class are the churches of St. Werburgh, Bristol, Banwell, Westerleigh and Brislington.

The third class is perhaps the finest. Here we have quite half the height of the tower given to a very lofty belfry storey, with its windows suitably transomed but not otherwise divided; the staircase turret is altogether discarded, and for the effect, if you do not admire the towers of St. Cuthbert's, Wells, and still more, of Wrington, it is because the photographs do not make the towers look as beautiful as the towers themselves look.

I have two examples to mention which cannot be classed in these groups. Yatton has a central tower (all those we have hitherto dealt with are western towers) with an unfinished spire like Shepton Mallet; and Backwell has a great many peculiarities, and some features we can hardly admire.

The rood screens of Somersetshire exhibit a treatment of the tracery and foliage wholly unlike the treatment of the same things in East Anglia and Lincolnshire.

ORDAINED SURVEYORS.

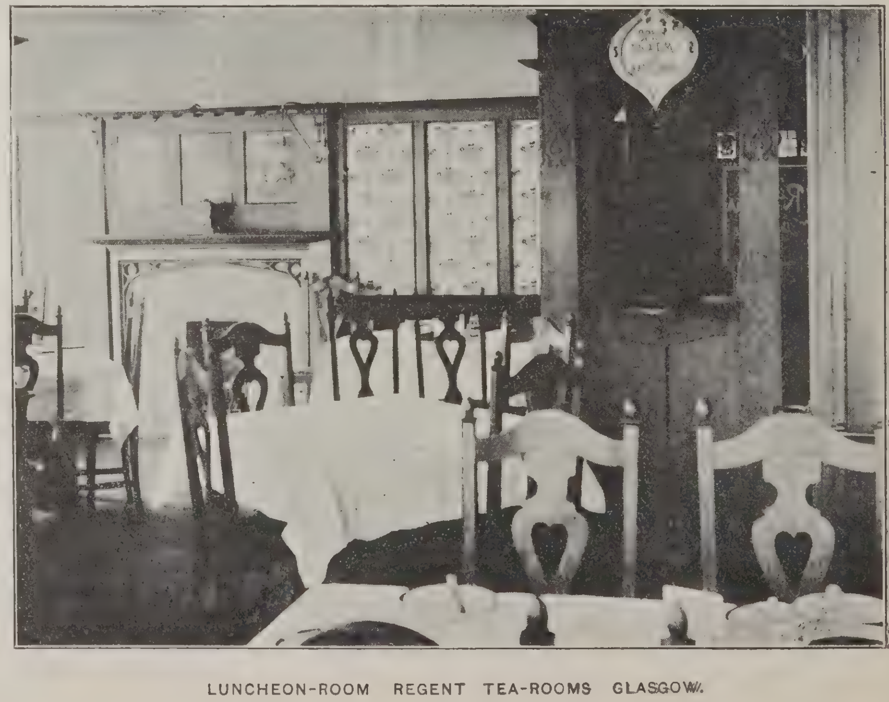
EIGHT candidates have come forward for the forthcoming preliminary examination of the Society of Ordained Surveyors to be held this month, and two for re-examination; nine for the forthcoming final examination, and one candidate for re-examination (all from Edinburgh). The Examining Board has resolved that in future the work done in the examinations need not necessarily be done according to Edinburgh methods, but that the examination should be a test of the candidates' general knowledge of the principles and practice of surveying, and of their capability to apply if necessary the methods adopted in Edinburgh or elsewhere. The Board has further resolved that the schedules and notes lodged by candidates in the final examination must be entirely their own work, and not prepared for and signed by someone else. The accounts of the past session show a balance in hand of £32 9s. 9d. The hon. secretary of the Society is Mr. Forest H. Lightbody, 56, Queen Street, Edinburgh.

SEWAGE-DISPOSAL.

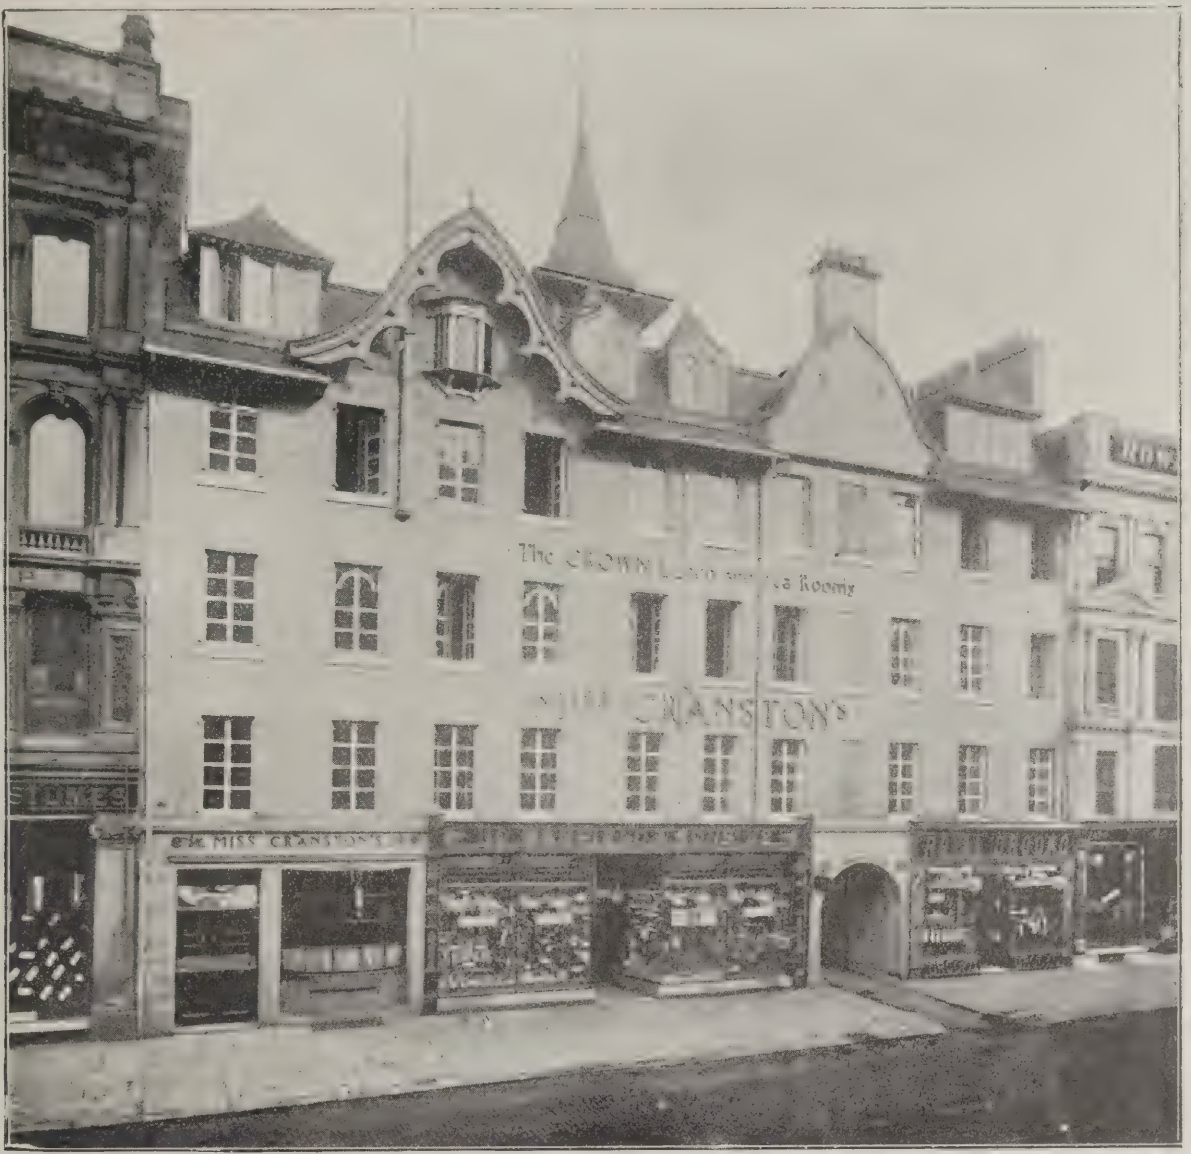
Commissioners' Third Report.

THE third report of the Commissioners appointed in 1898 to enquire as to methods of treating and disposing of sewage was issued recently, the present report dealing specially with two points—(1) the relations between local authorities and manufacturers in regard to the disposal of manufacturing effluents; and (2) the need of setting up a central authority. In regard to the first point the Commissioners are of opinion that the law should be altered so as to make it the duty of the local authority to provide such sewers as are necessary to carry trade effluents as well as domestic sewage, and that the manufacturer should be given the right, subject to the observance of certain safeguards, to discharge trade effluents into the sewers of the local authority if he wishes to do so. They do not think it possible to provide by direct enactment what these safeguards should be. In each district it would probably be desirable that the local authority should frame regulations which should be subject to confirmation by a central authority.

Having referred to the necessity of providing machinery for the settlement of differences between local authorities and manufacturers, the Commissioners find that the chief questions on which differences may arise are the following:—(1) The refusal of a local authority to allow a particular trade effluent to enter its sewers; (2) the refusal of a local authority to construct or enlarge sewers for the purpose of a particular manufactory; (3) the question of varying general regulations as to preliminary treatment by the manufacturer; (4) the amount of the special charge to be imposed on the manufacturer; and (5) the removal of sludge. The Commissioners took a considerable amount of evidence as to the means which should be adopted for settling these differences. The balance of opinion was found to be strongly in favour of the view that for the settlement it was necessary to constitute a Central Board possessing adequate technical knowledge, such as the Supreme Rivers Authority which the Commissioners recommended in their interim report.



LUNCHEON-ROOM REGENT TEA-ROOMS GLASGOW.



TEA-ROOMS, ARGYLE STREET, GLASGOW. RECONSTRUCTION BY H. AND D. BARCLAY ARCHITECTS.

SCOTCH CASTLES.

IN his fifth Rhind lecture at Edinburgh, Mr. Thomas Ross proceeded to point out that the third period of the architecture of Scotland began with the reign of James I. and ended with that of James V., comprising the whole fifteenth century and forty years of the sixteenth. What entitled that period to be regarded as a distinct epoch was that great castles and palaces again began to be built rivalling in size those of the first period. Linlithgow, Stirling, Edinburgh, Falkland, Doune, Tantallon, Dunfermline, Spynie, Balveny, Rosslyn, Edzell, St. Andrews and many others were all castles or palaces of great size, and were, some of them, built as one undertaking. Others, of which Hermitage and Crichton were examples, were greatly enlarged. These great buildings were more domestic in their arrangements than the first-period castles were. Although they were all strong houses, they were not planned on such entirely strategic lines. They were not, like them, divided into parts, each of which besiegers had to win successively at always increasing risk to themselves as the garrison got concentrated into narrower space. There was an increased appreciation of the refinements of life and manners, when it became impossible on both sides for the lord, the lady and their retainers to live in common in the great hall. That led to an increase of apartments and a division of the house, suitable to different degrees. Gunpowder, invented about that time, was first sent to Scotland in 1382, obviously for the munition of Roxburgh Castle, and ultimately that invention changed the whole art of war and fortification and had an undoubted effect on castle-building. Also about that time a remarkable group of Churchmen appeared in Scotland—founders of colleges, and encouragers of the new learning which was beginning to make itself felt—and as they were all great builders their influence must have been considerable in widening the scope of the conceptions of the amenities of life. But, perhaps, what gave the greatest impulse to the revival of domestic and castellated architecture was the magnificent patronage given by the Stuart kings at the Palaces of Linlithgow, Dunfermline, Stirling, Edinburgh Castle and Holyrood, Falkland and other places. Perhaps it was at Linlithgow Palace where the architecture of the period reached its highest level. As it then stood (and it was practically entire) it was begun, carried on and ended by the six Jameses, and by them only, so that it might be regarded as the grandest memorial which they possessed of the Stuart kings. One of the striking features of the great courtyard castles of that period was that the entrance was below the principal part of the building through into the courtyard, from which one reached the various stairs leading to the different parts. That would be observed at Tantallon, Doune, Balveny, St. Andrews, the restored centre of Dirleton, Linlithgow and other places. That passage was always well secured with drawbridge, stout doors and portcullis, worked from a room above, and was further secured against fire by being arched in stone. From the security of the courtyard the rooms could be safely lighted with large windows, and thus it often happened that these castles had a more cheerful air within than the outward appearance would lead one to expect. Along with these large courtyard castles and palaces, the old Norman keep plan still maintained its place, and in that period the largest of the kind was built at Borthwick. It was worthy of being compared with the Norman keeps in size and grandeur. Numerous examples of lesser size were built throughout the whole country. A series of them along the Firth of Clyde appeared to have been built, after a model plan, of about the same size and four storeys high. The arrangement of the hall and kitchen was carried out in each on the same lines. The kitchens consisted of one end of the hall partitioned off. They were perhaps 12ft. or 15ft. long by 4ft. or 5ft. wide, with an arched fireplace of the same size, round which the servants sat. These kitchens showed a considerable advance in domestic convenience over the earlier keeps, where most of the cooking must have taken place in the hall or in sheds outside. Confined and narrow as these keeps appeared now, there was often, doubtless, a considerable amount of domestic happiness with a sense of security experienced within their walls.

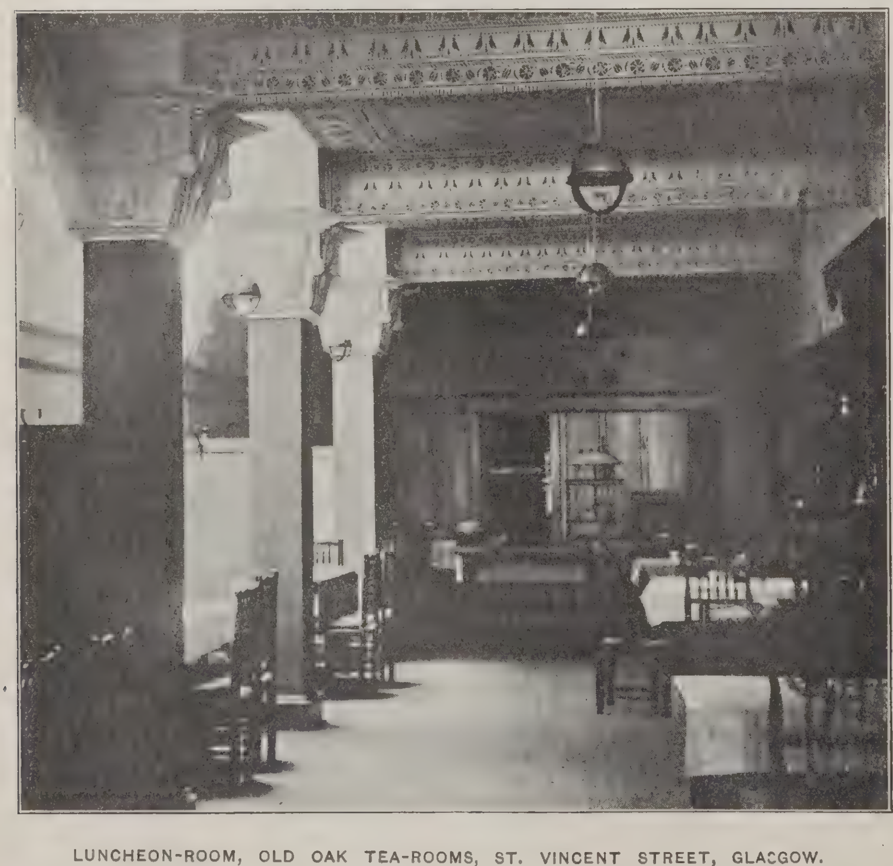
Bricks and Mortar.

Aphorism for the Week.

A Gothic cathedral is surely the most wonderful work which mortal man has yet achieved, so vast, so intricate, and so profoundly simple, so difficult to comprehend within one idea, and yet all so consonant that it ultimately draws the beholder and his universe into its harmony.—NATHANIEL HAWTHORNE.

Our Plates. THE two main buildings of the new premises in Union Street and Candover Street, W., consist of two flats on each floor, containing sitting-room, bedroom, kitchen, larder, coal-store and w.c. The corner building contains workshops in the basement, offices on the ground floor, with a separate entrance in Union Street, and flats over each with sitting-room, two bedrooms, kitchen, larder, bathroom, w.c. and coal store. The exterior is of red, grey, Luton and brown salt-glazed bricks, Portland stone, buff-coloured, snow-flaking and green-tinted cement, the trade panels being in green and brown mosaic. The roofs generally are covered with green slates, the flèches and turrets with copper. The whole of the joinery is to be finished white, except the oak frames to bays, which are to be stained. Messrs. Smith & Co., of Mount Street, are the general contractors, and the sanitary works are by Messrs. Thomas J, Boulting & Sons, of Union Street, Middlesex Hospital. The architects are Messrs. H. Fuller Clark and Percy A. Boulting, of 30, John Street, Bedford Row, London, W.C.

A Hereford Tower. THE tower of all Saints' Church, Hereford, has been stated to be in a dangerous state, but no catastrophe is imminent, though the tower needs repair. As far back as March, 1877, Sir Gilbert Scott reported that the tower had declined considerably from the perpendicular in a northern direction, owing to the failure of the foundation on that side. Proceeding, he said that "during the last century three great sloping buttresses were built on the north side, and a few iron ties were inserted which have proved of great support to the tower, very little movement having since taken place in the lower stages which are so strengthened. I would, however, recommend the insertion of some additional iron ties in places which show the need for them. I would also bond across the several fissures in the wall with strong landings and grout the interstices with cement so as to make the walls again compact. I would keep the great buttresses of the last century, but improve their appearance in accordance with the architecture of the tower, making the faces upright and introducing offsets and gablets. The parapet will have to be almost, if not entirely, new. The belfry windows should be opened where now walled up, properly restored, and fitted with oak louvres." Certain repairs were made to the tower at the time, but its complete restoration has not as yet been accomplished other portions of the church claiming prior attention. As is well known, the church has been restored in sections, on the recommendations contained in the report made by the late Sir Gilbert Scott in 1877, and the section now in hand—the restoration of the south aisle and chancel—is almost complete. Mr. Oldrid Scott, the late Sir Gilbert Scott's son, was lately requested to make an examination of the tower, and he says: "There can be no doubt that the full restoration of the tower is loudly called for by its condition. The outer surfaces are in a bad state, and it is due to this that small pieces of stone are frequently falling, but the structural defects are, I need not say, of a much more serious nature, for nothing beyond small fragments of the peeling surface of the stones are likely to fall, and these, though they may cause some alarm, could hardly do any real injury. I fear very little can be done to remedy this, as nearly every part of the tower is out of reach, except from a scaffolding. There can be no doubt that as soon as possible efforts should be made to put the whole tower in a really satisfactory condition." It is estimated that a complete restoration of the tower would mean an outlay of from £1,500 to £1,800.



LUNCHEON-ROOM, OLD OAK TEA-ROOMS, ST. VINCENT STREET, GLASGOW.

Bulgarian Houses. BULGARIAN houses are half subterranean. One descends by a steep incline, and the room or rooms are so far below the surface that there is only just space for apertures under the eave to supply light and air. During the "atrocity" agitation this style of building was gravely adduced as evidence of the terror under which the people lived; the poor wretches tried to conceal their dwellings as much as possible. The Bulgarian peasant is not renowned for intelligence, but he has more sense than this futile proceeding would imply. It is to keep his living-chamber warm in the terrible winter, so far as may be, with a minimum expenditure of fuel, that he sinks it partly in the ground. The upper "floor" is level with the earth in the summer. Armenians follow the same fashion, but as the cold is even more terrible there, horses and sheep and cattle must be lodged underground. The roof is flat, covered with a thick layer of turf, and when snow conceals the holes, glazed with oil-paper, which give light to the dwelling below, the inmates are not at all surprised to see a horse's leg crash through. That is a warning of the arrival of strangers, like a knock at the door.

Architectural Photography. WRITING in the "Daily Graphic," Mr. A. Horsley Hinton says:—In no class of subject is photography's superior power of delineation more self-evident than in the portrayal of the architectural, and one might say that it betrays a proportionate inferiority in imparting to the cathedral interior or other representation the sentiment of the subject. Mr. Walter Scutt, recently writing on this matter, asks "Is it that the excellence of modern photographic instruments, the marvellous wealth of detail given by the finest lenses of to-day, and the perfection of our printing processes run away with us, as it were, and we set mechanical perfection before all other qualities? Or is it that the mass of photographers are so supremely satisfied with their photographic productions, and so little acquainted with the great masterpieces of the other graphic arts? . . . There can be no general progress until photographers feel, as did the early water-colourists, that the mere delineation of detail is a bar to progress, and that a picture must be treated as a composition with a defined intention rather than an aggregate of detail?" Interior subjects have been rendered by photography with such exquisite perfection as regards accuracy of detail and suggestion of texture, and the value of such records as such is so great, that it may well be wished that sometimes at least the photograph might give also some of the feeling of solemnity, the mystery of dimly-lit spaces, the sentiment of uplifted column and wide-flung arch and dome, and this might be done if once the photographer fully realized that for this purpose the delineation of detail must be subservient to the rendering of light and shade—the descending shaft of light making dim all beyond it may not contribute to the exact portrayal of material objects, and twilight will borrow clearness of vision in exchange for the mystery it lends, and make a playground for the imagination where curious scrutiny is debarred. Those amateurs who have again and again given us such uncompromisingly perfect likenesses of cathedral interiors and similar subjects have probably never conceived the idea of treating the architectural interior in any other way than to make an inventory of every form and detail. They have lacked neither ability nor opportunity, but have never been prompted by the right motive for pictorial ends.

MODERN LONDON BUILDINGS.

(*Continued from* p. 109, *No.* 425.)

Having received numerous enquiries on the subject, we thought it useful to have a list compiled of the principal buildings erected in London during the last twenty-five years. In compiling this list the Editors have met with much difficulty. The pages of this and other technical journals have been consulted and put largely under contribution, and our thanks are tendered to our contemporaries for the large amount of information which was thus obtained. Still, inaccuracies and omissions must be inevitable in such an undertaking, and we should be much obliged to any of our readers who would kindly write to us with corrections and additions. As far as it is possible to do so the buildings are dealt with in districts, and, as will be seen, are gathered together under the respective years when they were erected. A list of public and semi-public buildings in the E.C. district was published in our issue for March 25th, and of domestic buildings, religious buildings, colleges and schools in the same district in the issue for April 1st.

E.C. DISTRICT: BUSINESS PREMISES.

BUILDING.	ARCHITECT.	APPROXIMATE COST.	REMARKS.
1875.		£	
Cassell & Co.'s Printing House, Ludgate Hill (site of Carrier's Inn).	Francis Chambers	—	Frontage 232ft.
Crown Court Buildings, Old Broad Street.	Edmeston & Son	—	Built of Box Ground Bath stone, with red Dumfries.
Delaterre's Premises, Poultry.	F Chancellor	—	Built of brick with Dumfries-stone dressings. There are lofty dormers in the roof. Mr. Kremer executed some historical bas-reliefs in terra-cotta.
Greenwood & Son, clockmakers' premises, Ray Street, Farringdon Street.	Rowland Plumbe	—	
London and County Bank, Lombard Street (large additional building, Nicholas Lane).	Mr. Parnell	—	
1876.			
David Evans's Premises, Wood and Milk Streets.	Herbert Ford	3,500	The facings are of Portland stone, carved by Mr. Seale.
Hampshire Banking Co.'s Premises, corner of Bishopsgate and Threadneedle Streets.	T. K. Green	40,000	
Office Premises, 89 and 90, Leadenhall Street.	Herbert Ford	3,500	The front is of Portland stone, the design being Gothic.
Samuel Brothers' Premises, Ludgate Hill.	Joseph & Pearson	—	The building is of seven storeys, each floor having an area of 4,000 sq. ft.
Sandon Brothers' Premises, 79, Mark Lane.	W. S. Witherington	40,000	
Shop Premises, 12 and 13, Poultry.	F. Chancellor	—	Built of red bricks and terra-cotta.
Warehouse for Mr. Lange, Camomile Street.	F. Chancellor	—	Built of red brick with red Dumfries-stone dressings.
1877.			
Ayres & Co.'s Premises, Aldersgate Street.	Lander & Bedells	—	
Fishmongers' Company's Offices, Billiter Street.	T. Chatfeild Clarke	—	
New Zealand Banking Co.'s Premises at the National Safe Deposit Co.'s Premises, Queen Victoria Street.	John Whichcord	—	Extensive alterations were made to fit up the building as a bank.
Office Premises, 8, Bucklersbury.	E. Woodthorpe	—	The building is 52ft. high and is faced with stone.
Premises for Mr. A. M. Kino, 42, Cornhill.	B. Tabberer.	—	Box Ground Bath stone is used for the elevation, the carving being by Mr. Seale.
Premises for Maw, Son & Sons, 7-11, Aldersgate Street.	H. B. Garling	—	The front is of Portland stone with terra-cotta finials.
Prudential Assurance Co.'s Buildings, Holborn (old portion).	Alfred Waterhouse	200 000	The buildings cover two-thirds of an acre ot ground. The Holborn frontage is 82ft. in length, the extreme depth being 360ft. The Brooke Street frontage is 190ft. long. The lower portion of the structure to the top of first floor is in massive red and grey polished granite. The central main entrance is supported by granite columns, and has an arch of the same material, the pediment surmounting the arch being of red brick and terra-cotta. The building is 80ft. high, and the materials used for the elevations are terra-cotta and red moulded brick, the general design being Gothic. The main foundation walls are 6ft. thick, and the floors are supported by iron columns.
Shops and Offices, corner of Little Moorfield and Short Street, Finsbury.	Joseph & Pearson	50,000	The frontage of the buildings is 186ft. long by 70ft. deep, and 60ft. high to the cornice. The centre of the elevation is surmounted by a clock tower 76ft. high. The area covered is 11,000ft. super., the building consisting of thirty shops, and each upper floor of ten suites of offices of four to five rooms each.
Royal Bank of Scotland, 123, Bishopsgate Street Within.	T. Chatfeild Clarke	—	The style adopted was Italian in the two Orders, Ionic and Corinthian. The building is surmounted by a handsome modillion and block cornice. The spandrels between the columns, filled with carving in low-relief, were executed by Mr. Anstey, as was also the other carving on the building. The materials are grey Aberdeen granite and Portland stone.
Tobacco Warehouse for W. D. & H. O. Wills, 53, Holborn Viaduct.	Robert Walker	—	
West India Dock Co.'s Dock House, Billiter Street.	A. Manning (engineer).	25,000	The style adopted is an adaptation of Venetian Gothic.
1878.			
Banking House for Mr. J. Mixer, corner of Newgate and King Edward Streets.	J. W. James	4,618	The elevation is of red brick and red Dumfries stone.
Fairbank's Showrooms, corner of St. Mary Axe and Camomile Street.	H. H. Collins	10,000	The front is of stone with red and grey granite, carved by Mr. Sansom.
Fourdrinier, Hunt & Co.'s Warehouse, Ludgate Square, Ludgate Hill.	Charles Bell	—	The building has six floors, and covers an area of 2,000ft. super. The elevation is in red and yellow brick.
Offices for Anderson, Anderson & Co., 5, Fenchurch Avenue.	J. J. Stevenson	—	
Premises for Mr E Burrell, Coleman and Gresham Streets	J. & W. Wimble	—	The style adopted for the elevation is Græco-Italian, and comprises an Order with red granite pilasters and rusticated piers to first floor. Above, Corsham Down stone with red Portland-stone dressings are employed. The carving is by Mr. Sansom.
St Mildred's House, Offices of the Gresham Life Assurance Co, Poultry.	J. J. Cole	40,000	
1879.			
Capital and Counties Bank, Ludgate Hill.	B. Tabberer	—	The building is 60ft. high. The upper part of the elevation is in Bath stone. The ground floor contains a banking hall 40ft. in depth.

E.C. DISTRICT: BUSINESS PREMISES—*cont.*

Building.	Architect.	Approximate Cost.	Remarks.
1879—*cont.*		£	
Leadenhall House, 99 to 103, Leadenhall Street.	J. L. Holmes	-	The frontage is 70ft. long, and the building is 180ft. deep, the style being Renaissance. Red granite is used in the elevation up to the top of the third floor, above which stone is used. The sculpture is by Signor Fucigna.
Moyley & Smith's Shops, Paternoster Row	Taylor & Locke	—	The frontage is 36ft. long and 56ft. high. The piers to the shops are of serpentine marble, the upper portion of the elevation being of Conflan and Portland stones.
Post-Office Savings Bank Buildings, Queen Victoria Street.	James Williams, H.M.O.W.		The building has a frontage of 146ft., and is 80ft. high and 100ft. deep. The elevation is of Portland stone, the back elevation being of brick and stone.
Rylands & Sons', Ltd., Warehouse, 50, 51, 52, Wood Street, Cheapside.	J. & J. Belcher	—

Warehouses for Drugs, 60, Bartholomew Close.	Aston Webb	—	
Warehouses (site of All Hallows Church), Watling Street and Bread Street.	Alexander Peebles	—	The buildings are in the Queen Anne style, and are of red brickwork with Portland-stone dressings and terra-cotta ornament. The Watling Street frontage is 80ft in length, and that to Bread Street 30ft. The adjoining warehouses and offices in Bread Street, designed by the same architect, are in Portland stone and Bath stone. and have a frontage of 45ft., the height being 50ft.
Warehouse for Alexander Pirie & Sons, 96, Farringdon Street.	George Vickery	—	The style adopted for the warehouse is classical in tendency. It is executed in red brick and Portland stone. It has a frontage of 54ft. and a height of 70ft.
1880.			
London and Lancashire Life Insurance Company's Buildings, Cornhill.	T. Chatfeild Clarke	20,000	The elevation is in Portland stone and polished granite, and is 55ft. in length by 70ft. in height. The design is in the Early French Renaissance style.
Offices, 18 & 19, Addle Street, Aldermanbury	E. H. Martineau	—	The materials used in the construction of the building were red bricks and red Mansfield stone. The cornices are of red moulded bricks and terra-cotta, and the window dressings of Portland stone.
Offices, 20, Bucklersbury, corner of Queen Victoria Street and Cornhill.	John Whichcord	300,000	The foundations are carried down to a depth of 40ft., which admits of the construction of a lower ground-floor, basement and sub-basement, the sub-basement being 30ft. below street-level. The frontage to Bucklersbury is 40ft. in length and 70ft high. The ground floor is faced with Portland stone, and the five floors above with red bricks, Portland-stone quoins. pilasters, &c.
Reliance Mutual Life Assurance Society, 70, 71 & 72, King William Street.	F. Chancellor	15,000	The exterior is of red granite and stone, in the Renaissance style. The principal office measures 37ft. by 28ft. and is 17ft. high.
Shop Premises, 106, Cheapside.	William Wimble	—	The front is of Portland and Bath stones, and is designed in the French Renaissance style. The carving is by Mr. Sansom.
1881.			
"Gresham Press" Buildings, Little Bridge Street.	Rowland Plumbe	—	The shops on the ground floor are carried up on Bath-stone pilasters. The upper storeys are in stock brickwork, with red-brick bands. The buildings are in the Queen Anne style.
Office Buildings in connection with the Wool Exchange, Basinghall Street.	John Gordon	—	The Basinghall Street frontage is in the Renaissance style, the elevation being 72ft. high by 60ft. wide. The ground floor is of Aberdeen granite with Bath stone over, profusely carved.
Standard Life Assurance Co's Offices, King William Street.	Boulnois & Warner	—	The frontage to King William Street is 103ft., the return frontage being 52ft. and the height 72ft. to top of parapet. There are five floors, including the basement. The lowest order consists of red Aberdeen granite pilasters on a massive stylobate the intermediate façade is of Portland stone, with ¾-columns of the same stone above a granite cornice at second-floor level.
1882.			
Corn Exchange, Mark Lane	I'Anson & Son	—	The market consists of a hall 120ft. by 60ft. The plinth of the façade is of Kenway grey granite, the upper portion being of Portland stone, with pilasters of polished red Aberdeen granite. The frontage to Mark Lane is 105ft.
London and Provincial Fire Insurance Company's Premises, corner of King William Street and Abchurch Lane.	Davis & Emanuel	30,000	The elevation is in Portland stone, profusely carved, and is 36ft. long, with a depth of 80ft. and a height of 58ft. There are five floors.
Metal Exchange Buildings Whittington Avenue, Leadenhall Street.	Edmeston & Son	—	The building has a frontage of 51ft and a depth of 128ft., and is 68ft. high. Granite piers are carried up to first-floor level, the rest of the building being in Portland stone, elaborately carved. The exchange room is 60ft. by 38ft. besides which there are fifty-two offices.
Shop for W Abbott & Son, 60, Ludgate Hill.	C. J. Phipps	—	The building is of red brick and red Dumfries stone.
Stationers' Co.'s Offices. corner of Ave Maria Lane and Amen Corner.	R. W. Mylne	30,000	The frontage to Ave Maria Lane is 105ft. long and 57ft. high to cornice and 64ft. to ridge. The ground floor is of Portland stone, with pilasters of the same material, above which are three storeys with malm facings. The buildings contain offices and warehouses.
1883.			
Attenborough's Premises, 193, Fleet Street.	Archer & Green	—	The elevations are of red Corsehill stone and red granite.
Brew & Claris's Premises, 54, Finsbury Pavement	Edwin T. Hall	—	The frontage is 90ft. long, and there are six floors. The facings are of red brick and the dressings of white stone.
Brown John & Co.'s Bank, Abchurch Lane.	J. Whichcord	—	The building has four storeys carried out in Portland stone, profusely carved. The bank occupies the ground floor; the other floors contain suites of offices.
Church Missionary Society's Buildings, Salisbury Square, Fleet Street, (additions).	Mr. Bracebridge	—	The additional building has a frontage of 26ft. The ground floor is of rusticated Portland stone, and the three upper storeys are of white Suffolk brickwork. The building contains new board-room and offices.
Eaton & Son's Premises, New Street, Bishopsgate Street Without.	Charles Bell	—	The building comprises offices on the ground floor, with a warehouse. The exterior is of white Suffolk brickwork, with Bath-stone dressings and cornices.
Spottiswoode & Co.'s Additional Buildings, St Bride Street.	Henry Dawson	30,000	The additional frontage is 106ft in length and 50ft. in depth, and the buildings are 80ft. high. The ground floor is in Corsehill stone and the upper portion in red brickwork.
Furniture Warehouse for Walker & Sons 119, Bunhill Row.	Davis & Emanuel	—	The warehouse has a frontage to Bunhill Row of 200ft. It is in the Italian style and is built of white bricks, with cement dressings.
London Joint Stock Bank Buildings, 123, Chancery Lane.	Mr. Harrison	—	The frontage to Chancery Lane is 60ft. in height and 50ft. in length. The ground floor is of Portland stone. and the upper floors are of yellow brickwork with red brick dressings and a deep cornice in Portland stone. The banking chamber on the ground floor is 60ft. deep. The basement floors are also used for banking purposes. The upper floors are planned as offices.
Middle Temple Chambers, 4, Brick Court and 5, Essex Court, Temple.	J. P. St. Aubyn	—	The block is 21ft. by 33ft., and is built of red brick with Portland-stone dressings.
Offices, 7, Bell Yard, Fleet Street.	Isaacs & Florence	4,341	The building is constructed of red Fareham bricks and Portland stone, and consists of offices with a shop on the ground floor.
Maxwell & Sons Premises, 8 Bell Yard Fleet Street.	Isaacs & Florence	—	The ground floor contains public offices and the first floor private offices over which are ware-rooms. The elevation is in Portland stone
Philip's Premises, 30, 31 and 32, Fleet Street.	G. E. Knightley	—	The front is of brown Portland stone, and is in the French Renaissance style.
Rochester Buildings, Leadenhall Street.	William Hudson & Son.	—	The building has a frontage of 80ft. and a depth of 123ft. The facings are of red brick, the dressings of Chilmark stone and the staircases of Craigleith stone. The carving was executed by Mr. Frampton.
Rylands & Sons' Premises, London Wall.	J. & J. Belcher	—	The facings are of red brick with Dumfries-stone dressings. Each floor has three-light mullioned windows. The carving was executed by Mr. Seale.
"Sportsman" Offices, Fleet Street.	W. B. Brown	—	The building contains four floors, a dormer storey, and a basement for machinery. It is faced with red Corsehill stone and has a granite basement. The frontage is 40ft. in length and 60ft. in height, and the depth is 120ft. The entrance has a pediment over, in which is carved the figure of a racehorse.

E.C. DISTRICT: BUSINESS PREMISES—*cont.*

Building.	Architect.	Approximate Cost	Remarks.
1883—*cont.*		£	
Stock Exchange Buildings, Throgmorton Street.	J. J. Cole	83,000	The area covered is 5,000ft. The frontage is 100ft. to Throgmorton Street. The foundations are carried to a depth of 36ft. The Exchange room is octagonal in shape, being 60ft. in diameter and 100ft. high to apex of dome. The basement is about 20ft. high from floor to ceiling. The property is worth about £100,000.
1884.

1886.			
Harrild and Sons' Offices, 25, Farringdon Street.	T. K. Green & Son	—	This building is carried out in Renaissance style. It is of brick with terra-cotta dressings.
Legal and General Life Assurance Society's Offices, 10, Fleet Street.	R. W. Edis	—	The facings are of red brick with terra-cotta dressings. The lower portion of the building is occupied by the Society. The premises have a frontage of 50ft. and a depth of 200ft.
London Parcels Delivery Co.'s Offices and Stables, Rolls Bldgs., Fetter Lane.	W. S. Witherington	6,000	The frontage is 40ft. and the depth 100ft. The ground floor is carried up on blue Staffordshire brick piers. The two upper storeys are in stock brickwork.
Offices and Sale Rooms, 31, Fenchurch Street.	Collier & Merrin	—	The front is of red Corsehill stone, the ground storey being of red granite, with transoms and mullions to windows of the same material. The carving is by Mr. Frampton.
Prudential Assurance Co.'s Offices (additional building), Holborn.	Alfred Waterhouse	—	The additional building is 140ft. long and contains five floors. It is uniform in design with the then existing buildings, and is of red brick and terra-cotta.
St. George's House, Eastcheap.	Delissa Joseph	—	The building is designed in the free classic style, with details of French Renaissance tendency. It has a frontage of 100ft and a height of 85ft. There are six storeys in the front building, which consists of five bays, divided by fluted pilasters, with carved caps, the whole being in Portland and Beer stones, except the ground-floor portion, where the columns and pilasters are of red Aberdeen granite.
Shop Premises corner of Ludgate Hill and Creed Lane.	Joseph & Smithem	—	The ground floor contains shops with granite pilasters and Portland stone above, profusely carved. The frontage is 44ft. to Ludgate Hill and 46ft. return front. The building contains five storeys.
Steven Brothers & Co.'s Premises, 4, Upper Thames Street.	James Weir	—	
Winchester House, Old Broad Street.	F. T. Pilkington	—	
1887.			
Bank of England, Fleet Street Branch.	Sir A. W. Blomfield	—	The building has a rusticated base of Aberdeen granite 11ft. high. The superstructure is of Portland stone, polished granite being used for the columns, panels and spandrels. The lower portion of the building is devoted to banking purposes, while the upper portion forms the manager's residence.
Game, Son, Harrison & Larner's Premises 2 & 4, Eastcheap.	E. & E. B. Ellis	—	The first, second and third floors are devoted to offices. The ground-floor storey is of red granite, above which is Portland stone.
Ingram House, 165, Fenchurch Street.	Thomas Blashill	—	The building consists of three shops, offices and store-rooms
Lloyds Bank, Ltd., 71, Lombard Street.	J. A. Chatwin	—	The frontage is 84ft. in length, and the building has a depth of 82ft. The lower portion of the façade is in grey Cornish granite, and the first floor is carried on Doric shafts 17ft. high, the upper portion being of Portland stone, with Ionic columns supporting the cornice. The banking room on the ground floor is 61ft. by 55ft. The directors' board-room is on the first floor, and strong-rooms and lavatories are situated in the basement.
Office Premises, 68 & 70 Finsbury Pavement.	Theodore K. Green	—	The front is of red brick and terra-cotta.
Offices and Warehouses, 73, 74 & 75 Lower Thames Street.	Banister Fletcher	—	The front is faced with Bath stone and red brick.
Stock Exchange Buildings, Throgmorton Street (additions).	R. L. Cole - -	—	The building has a frontage to Throgmorton Street of 96ft. The Octagonal Hall has a dome 70ft. in diameter and is 100ft. in height. The plinths are of Peterhead granite, and the arches, cornices, &c., of Portland stone. The street fronts are also of Portland stone and granite. Below the exchange is the settling-room.
Premises, corner of Eastcheap and Gracechurch Street.	Delissa Joseph	-	These premises are designed for the tea and foreign fruit trades. They have a frontage of 100ft., and consist of six storeys 85ft. high. There are red Aberdeen granite (polished) pilasters and columns, with capitals carved to represent fruit by Mr. Gilbert Seale.
St. Martin's House, Ludgate Hill.	Joseph & Smithem	—	The building is in the Italian Renaissance style. It contains shops on the ground floor.

(To be continued.)

Keystones.

The Royal School of Art Needlework, in Exhibition Road, S.W., of which Mr. F. B. Wade, F.R.I.B.A., is the architect, is to be formally opened by the Prince of Wales on Wednesday, April 29th, at 3.30 p m.

Bury Park Congregational Church, Luton, Beds., is being erected. It is to be faced with red bricks with Costessey brick dressings. The contract is let to Messrs. T. & E. Neville, of Luton, at £4,420. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

A West Hartlepool Competition. — The assessor, Mr. John W. Simpson, F.R.I.B.A., in the competition for a school for the West Hartlepool School Board, has awarded the first place to Mr. Richard Holt, of Liverpool; the second to Mr. James Carry, of West Hartlepool; the third to Messrs. Bottomley, Son & Wellburn, of Middlesbrough; and the fourth to Messrs. Jones & Sellers, of Oldham.

The Bristol Society of Architects held its annual general meeting last week, Mr. Joseph Wood presiding. The following officers were elected:—President, Mr. Joseph Wood; vice-presidents, Mr. G. H. Oatley and Mr. F. W. Wills; members of the Council, Messrs. W. L. Bernard, F. Bligh Bond, J. H. La Trobe, Thomas Nicholson, W. S. Skinner, J. Foster Wood, and H. Dare Bryan, hon. secretary and treasurer; associate members of Council, Messrs. Mowbray A. Green and T. H. Weston.

Competition Reform Society.—The committee disapproves of the existing conditions of the competition for public baths at New Brompton, because—there is no assessor, the council do not bind themselves to carry out any of the designs, and the remuneration is unsatisfactory. They therefore request their members to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised. All members who have received conditions of the Maidenhead free library competition are also requested to write to the town clerk protesting against the unsatisfactory clauses.

The Devon and Exeter Architectural Society held its annual meeting at Devonport on April 4th. The council reported, among other things, that it was gratifying to know the exception taken to the conditions of the St. Ives town hall competition had resulted in only one set of plans being submitted, and these were not adopted on the promoters' discovery that architects had declined to compete. Mr. J. M. Pinn, in his presidential address, said he was somewhat sorry the Gothic style had latterly gone out of fashion for secular buildings; and, speaking of registration, he expressed himself not much nearer being convinced that it would benefit the profession than he was some years ago. Mr. A. S. Parker, A.R.I.B.A., was elected president for the ensuing year and Mr. C. Cole vice-president. — The Three Towns branch of the Society held its annual meeting on April 3rd at Plymouth. Mr. A. S. Parker, who presided, referred to the local by-laws, and the endeavour of their committee to get them reformed. The committee intend to consult the borough officials before petitioning the Council to take the matter into consideration. Mr. Parker was re-elected chairman, and Mr. E. Coath Adams appointed hon. secretary and treasurer. Mr. B. Priestley Shires was accorded a hearty vote of thanks for his services during the past five years. Mr. W. H. May was appointed hon. librarian. The following committee was elected: Messrs. Leest, Lethbridge, Shires, Lister and Dwelly.

The Liverpoool Architectural Society (Incorporated) held its annual meeting last week, Mr. John Woolfall presiding. The following officers were elected:—Messrs. T. E. Eccles and P. C. Thicknesse, vice-presidents; Hastwell Grayson and Gilbert Fraser, hon. secretaries; James Dod, hon. treasurer; Alan G. James, hon. librarian; H. P. Mortes and W. Glen Dobie, auditors. The following were elected Fellows of the Council:—Messrs. J. Dod, H. Hartley, E. P. Hinde, E. A. Ould, S. Pugin, W. E. Willink and Prof. F. M. Simpson. Associates elected for the Council were Messrs. Alan G. James and A. Thornley.

Obituary.

Mr. William Botterill, of Hull, one of the best-known architects in the East Riding, died last Thursday week. He was born at Brompton, near Pickering, in 1820, and went to Hull more than half a century ago to act as clerk of works under Mr. Andrew, of York, the architect of the hotel at the Paragon Railway Station. He continued in practice alone as an architect and surveyor until about 1876, when he took his son into partnership. Mr. John Bilson, F.R.I.B.A., joined the firm in 1881, shortly after the son's death, and it has since been known as Botterill, Son & Bilson. He was architect and surveyor under the Hull School Board, most of the public elementary schools in the city having been erected from his designs and under his supervision. Among his well-known buildings at Hull may be mentioned the Hull Exchange, the York City and County Bank, the Danish Lutheran Church, St. Philip's Church, the Port of Hull Society's Orphan House (now the Hull Technical School), and several Wesleyan chapels, including the Beverley Road Chapel. One of his latest works was Hymers College, which he designed in conjunction with Mr. Bilson. Mr. Botterill retired from business in 1899.

Law Cases.

A "Building" under the L.B.A.—At North London Police Court last week the "Pyrojim" Syndicate, Ltd. (who are experimentally trying to make the refuse of Islington into patent fuel), were summoned for contravening the London Building Act by erecting a building without the necessary sanction of the L.C.C. The defence was that the sanction of the Islington Borough Council had been obtained for a wooden structure (such as this was), and that was sufficient. There was an engine and boiler inside, with a 30ft. funnel through the roof, and it was said that the wheels would have to be put on the engine and boiler, and the funnel taken off, in order to remove them from what was submitted to be a temporary structure.—The magistrate held that it was a building within the meaning of the Act, and ordered a conviction, with 40s. penalty.

Wrongful Dismissal of an Architect.—In the King's Bench Division last week Mr. Justice Walton delivered a considered judgment in the case of *Waterman* v. *the London (Riverside) Cold Storage Co., Ltd.* It was an action by Mr. W. H. Waterman, an architect and surveyor, of Cullum Street, against the defendants for wrongful dismissal, and for £1,108 0s. 11d., the balance of fees for work done and money expended for and on behalf of the defendants. The plaintiff had acted as the defendants' architect for some time. On a dispute arising as to the underpinning of a wall at Symons' Wharf, he was dismissed on the ground that he had committed a breach of duty. His Lordship held that the defendants had failed to establish any such breach of duty by the plaintiff, and gave judgment for the plaintiff for £953 11s. 9d., after deducting certain payments.

Builders' Notes.

L.C.C. Trams. — The London County Council has accepted the tender of the British Westinghouse Co. for 200 electric tramcars, to cost £111,000.

Holborn - to - Strand Plots.—The eastern horn of the crescent has already been submitted to public auction, and it is proposed to offer various other plots for letting on lease in June next.

A Strike in New York has occurred on the part of the Brotherhood of Carpenters and Joiners: 9,000 members of this union ceased work on Wednesday last because 2,000 workmen from the Amalgamated Society of Carpenters, which is affiliated to the English organisation of Manchester, were employed on certain buildings which are in process of erection.

Cardiff Painters.—The members of the Cardiff branch of the Amalgamated Society of House Decorators and Carpenters are asking for an addition of 1d. an hour increase in wages from May 1st next. There is a fear that the men will strike, as the employers are not disposed to favourably entertain the request. The men also seek other concessions

A Dispute at St. Helens has occurred between the joiners and the masters, the former refusing to fix what is known as foreign or ready-made joinery, such as doors, window-sashes, &c. The employers resent the men dictating to them as to where they shall purchase their materials. The masters have decided that unless the men withdraw their opposition there will be a general lock-out on Monday next. Both sides are firm, and a lengthy dispute is probable.

Messrs. Mellowes & Co., of Sheffield and 28, Victoria Street, London, have received the order for covering with their patent "Eclipse" glazing the roofs over Lostock Hall Station (for the Lancashire and Yorkshire Railway); Royal Naval College, East Cowes; electric station for the Leek Urban District Council; extension to shops for Messrs. J. H. Andrew & Co. at Sheffield and for Messrs. Leys at Derby; also the plumbing work at the last-named shops.

The Incorporated Institute of British Decorators held its annual dinner last week at the Trocadero Restaurant. The president (Mr. J. D. Crace) was in the chair. Mr. W. G. Sutherland, in proposing "The Incorporated Institute of British Decorators," said the Institute was the apex of a movement which began about ten years ago. The first idea of the Institute came from Scotland, but the scheme was taken up with great enthusiasm by Englishmen and Irishmen. He thought that no little part of this was due to the fact that they were associated with the Painter Stainers' Company, and it was also to their first and only president, whose name was known throughout the entire kingdom as the representative of a long line of artists and decorative artists. Their membership was nearly 400.

Building in South Africa.—A number of new buildings are in course of erection at the East Rand. At Boksburg a large double-storey hotel will soon be in the hands of the builders, to cost about £5,000. Zeeman's Buildings are costing £4,000. A Presbyterian church is being erected at a cost of £5,000 by the contractor, Mr. J. J. Fowle. The front of the building will be let as shops, the church being in the rear. The Masonic Temple at Boksburg will shortly be in the hands of the builders. Plans are also in readiness for the building of a brewery at Springs, to cost between £4,000 and £5,000. An hotel is also being built at Benoni, to cost £2,000. A private residence is being erected at Elsburg, to cost £4,000.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Church Ventilation.

London.—S. C. C. writes: "Are there any books dealing at length with modern requirements of ventilation in places of worship?"

"The Ventilation, Heating and Management of Churches and Public Buildings," by J. W. Thomas (Longmans, Green & Co.).

Buildings to Measure near Abergavenny.

Swansea.—Abertawe writes: "What churches are there in the neighbourhood of Abergavenny, Mon., suitable to measure for the R.I.B.A. intermediate examination?"

Abergavenny is situated on the Welsh Marches, or debatable land between England and Wales. It is therefore to be expected that very little building was done in the neighbourhood during Gothic times. Abergavenny Church (St. Mary's) contains original doors and windows, which may be worth examining, but really satisfactory work is not to be looked for much nearer than Tintern in one direction and Ross in another. G. A. T. M.

"Public" and "Domestic" Buildings under the L.B.A.

London, S.W.—J. P. B. writes: "Can a public building (say, an hotel with sleeping accommodation for more than 100 persons) be also considered a 'domestic building' or 'dwelling-house' under the London Building Act, 1894, and would the example mentioned have to conform to sections 41 or 43 of the Act?"

We have made enquiry, and are informed on good authority that the legal advisers of the London County Council, to whom the question has been referred, are of opinion that a building may be at the same time "a public building" and "a domestic building" for the purposes of the Act, and as such would be required to conform with all sections of the Act regulating the two classes of buildings. The point has not, it is believed, been decided judicially, but you may take it, until a decision has been given to the contrary, that this is the state of the law. H.

Boundary of Property.

Brighton.—Nimaneb writes: "I am dealing with some land bounded originally by a hedge and ditch, both of which belonged to my clients, the ditch being outside the hedge. This ditch has been filled in by the adjoining owner. I suppose our claim to its site is limited to a line 3ft. from the roots of our hedge, or can we claim the whole original width of the ditch? The line 3ft. from the hedge-roots would probably be about the middle of the old ditch."

In the absence of evidence to the contrary, the legal presumption exists that the ditch belongs to the property on that side of the hedge on which the ditch is not. In your case the ownership does not appear to be in doubt, but only the distance from the stake-root of the hedge. In some places 3ft. from the roots of the quickwood are allowed for the breadth of the ditches, and in exceptional cases 5ft., or even 6ft., are allowed. The most usual custom, however, is to allow 4ft., and you will find all parish boundaries so marked upon the 28in. Ordnance maps. I presume the ditch in question has never formed the bed of a stream, as in such case each riparian owner can only claim one-half of the bed. I would advise that you claim 4ft. as the proper distance from the centre of the hedge, insert wooden stakes upon the actual boundary so found, and then draw the adjoining owner's attention to them, that no dispuse may hereafter arise should it be desired to build to the boundary. If considered advisable, the little stakes may be branded with name and date—they should be of oak if intended to remain for any length of time. G. S. M.

Land Drains.

Liverpool.—G. B. writes: "The site upon which part of a church stands (sketch plan not reproduced) is of exceptionally wet clay with a fall of about 1 in 10. It is proposed to cut a rubble drain across the site. Which is the best method of laying it and also connecting to the sewer?"

The sketch plan should have shown the inclination of the ground, but we presume the proposed rubble drain is to be at the higher end of the site and is designed to take the water from the upper slope. With heavy wet clay soil we do not think either the rubble drain or the position assigned to it suitable. We recommend the proper unglazed butt-jointed earthenware pipes 3in. in diameter laid in straight diagonal lines across the site, the lines 12ft. apart, or perhaps 10ft. as the soil is so wet. They should be laid at a depth of 2ft. 9in. to 3ft. 6in., have a fall towards main land drains (4in. diameter pipes) laid on left side and lower end of site, having outfalls into the trapped manhole discharging well above the invert of the latter. The main drain should be laid 3in. deeper than the sub-mains, so that the ends of the latter rest on the top of the main drain pipes. If the land drain pipes are not procurable, or are very expensive, the same scheme can be carried out with rubble drains, which, however, are not so efficient or permanent. Such drains would be considerably larger in size and should have flat stones at the bottom, stones for uprights at sides, and be covered with another flat stone. All drains, whether pipe or rubble, should have a covering of turf, gorse or brushwood, or even coarse ashes, to prevent being choked with loose earth.

Sewage Outfall Works.

Worksop.—A. H. R. writes: "Kindly state at what height a sill for a storm-water overflow should be fixed under the following conditions:—The earthenware pipe is of 15in. diameter and laid to a gradient of 1 in 700. The dry-weather flow is 40,000 gals. per day. After this has become diluted three times (120,000 gals.) it is required for the excess to overflow direct on to the land; then, again, after being diluted six times the dry-weather flow the excess is to pass direct into the stream."

You do not give sufficient data to enable us to express an opinion. The problem of the relation between the rainfall and the sewer discharge is one of the most difficult that confronts the engineer, and the volume in heavy storms can only be ascertained by careful and prolonged record of rainstorms in the district to be drained. Even then the figures obtained would be only approximate. The amount of storm-water might be sufficient to fill the manholes and choke the entire sewer, and its discharge at the outfall would be at a greatly increased velocity, caused by the pressure. In any case the storm-water would not reach the outfall at the regular rate which would enable you to put such a system as you mention into operation: for instance, 240,000 gals. (the normal flow diluted six times) per day would be 1,000 gals. per hour. Your 15in. pipe could discharge 1,000 gals. in about three minutes with the gradient mentioned and some pressure. We advise you to consult "The Sewerage Engineer's Notebook" by A. Wollheim, 3s. 6d. nett. (St. Bride's Press, Ltd., 24, Bride Lane, E.C.).

Calculating Scantling of Timber.

London, W.—H. K. W. W. writes: "What would be the scantling of a piece of timber carrying a safely-distributed load of 20 cwts. over a span of 10ft., using the formula $\text{B W} = \frac{2cbd^2}{\text{L}5}$?"

The formula suggested, $\text{B W} = \frac{2cbd^2}{\text{L}5}$, may be more simply written, $\text{B W} = \text{C}\frac{bd^2}{\text{L}}$. Here B W represents the single load in cwts. placed in the centre of the span, which would cause rupture in the beam; C (the equivalent of $\frac{2c}{5}$), a constant varying, according to Hurst, from 3·6 for white spruce fir to 4·0 for Dantzic and Memel timber, all being of selected quality; *b* the breadth and *d* the depth of the beam in inches; and L the unsupported length or span in feet. For convenience, assuming C to be equal to 4, we have $\text{B W} = 4\frac{bd^2}{\text{L}}$. The load required to be borne *safely* is 20 cwts. distributed. The effect of such a load would be equivalent to a single central one of 10 cwts. A factor of safety of from 7 to 10, according to circumstances, should be adopted, and using the latter figure, viz., 10, we obtain an equivalent *breaking* load of 10 cwts. by 10, or 100 cwts. Substituting now the above equation we obtain $100 = \frac{4bd^2}{10}$, whence $bd^2 = 250$. Assuming a depth of 9in., we have $b \times 9^2 = 250$, or $b = \frac{250}{81} = 3$. A 3in. by 9in. would be sufficiently strong. This answers the question; but a better and less rule-of-thumb method is that indicated in my article on bath floors in the Builders' Journal for April 3rd and 10th, 1901. The questions of the necessary stiffness of the beam and the proper factor of safety according to the character of the load to be supported are alluded to there, and ought to be taken into consideration in any case in practice. The reason why a single central load has twice the effect of a distributed one as regards bending moment is given in most text-books.

E. B. B. NEWTON.

Comparison between Plain Wall and Rough-cast Wall.

Harrow.—Atlantic writes: "(1) How would a 9in. brick wall of Flettons, rough-cast on the outside, compare for rain and weather-resisting with a 14in. brick wall of good facings outside and Flettons inside? (2) What is the best method of rough-casting for the above purpose? (3) How would the two walls compare in cost?"

(1) In all probability the 9in. wall with rough-cast would prove drier than the 14in. solid work, though something depends on the quality of the bricks used in the latter case. If, however, the expense of a 14in. wall be not objected to, why not build it hollow, and so make it certainly waterproof? See articles in The Builders' Journal for January 16th, 1901, or in "Specification, No. 5," pp. 253 and 255. (2) Details of external plastering are given on p. 544 of "Specification, No. 5." I agree with what is there stated, namely: "Portland cement is unquestionably the best material for external plastering—for weather-resisting properties, strength and capacity for moulding and painting, it is unequalled." Rough-cast is, however, often executed in lime (best if used hot) instead of cement. (3) The 9in. wall and rough-cast would no doubt constitute the lower-priced work. It may interest you to hear that I have recently made a very damp and porous 9in. wall perfectly dry and weather-proof by covering it externally with corrugated iron sheeting, placed vertically, and secured to battens in much the same

way as "weather tiling" is done. The whole being painted stone colour, its appearance is not found objectionable. G. S. M.

Building Construction.

J. T. writes: "In what issues did the new articles on building construction appear?"

November 12th and 26th, December 3rd, 17th and 31st, January 14th, February 4th and 18th last.

Dancing Steps in Stairs.

SPRINGFIELD.—C. W. writes: "What is the method of finding the centres for dancing stairs? Rivington mentions it in Part 2 of his 'Building Construction,' but does not give a method of finding the points from which the steps radiate."

The steps in all cases should be set out on plan of a uniform width (fliers and winders alike) along the line that one would naturally take in mounting. This line, which is referred to as the "going line," "line of travel," "line of ascent," should be taken at a distance of 16in. to 18in. from the plan of the centre line of the handrail. The equal spacing along the going line, indicating the number of steps, will of course depend on the plan space available from "start" to "land" of stair considered in relation to the fixed height to be reached so as to give a suitable proportion of tread to rise. Then, whatever direction the riser lines may be made to assume, they should pass through these previously-determined points on the going line. The natural disposition of the riser lines would be when directed normally or perpendicularly to the line of ascent; but when this arrangement is rigorously adhered to it will in general (always in the case of small wells) make the ends of the winders at the well unduly narrow as compared with the width of the fliers, and as a result there will be sudden changes of pitch in passing from fliers to winders, shown on the "falling lines" of the well string and handrail. These objectionable features may be greatly modified by making the winders and two or more of the adjacent fliers "dance," that is, swinging the riser lines round upon the fixed points on the going line—already referred to—as pivots out of their normal position and making them pass through a second series of points, usually determined on the plan line of the centre of handrail. Probably no definite rule could be laid down for determining the latter series of points which would answer in all cases, as the number of fliers that should be distorted will be, in any case, more or less a matter of opinion. It is clear that if the arrangement result in giving excessive obliquity to the riser lines this may prove a positive defect. In practice it will generally answer well enough to increase the end of the winder occurring in the middle of the well about $\frac{1}{2}$in. beyond what would be its width if a normal disposition of the risers had been adopted, and for the ends of the other steps between it and the first untouched flier to gradually increase their width by an equal amount (determined by their number) so that the flier would form the last term of an arithmetical series. Thus, if there were four intermediate steps, width of flier 10in. and that of end of tread in middle of well made 5in.,

$$\text{amount of increase} = \frac{10\text{in.} - 5\text{in.}}{5} = 1\text{in.},$$

so that the successive widths would be 5in., 6in., 7in., 8in., 9in., 10in. Before drawing in the riser lines finally, however, it may be well to draw out a development of the section of the steps, thus obtained, made by the cylindric surface, standing over the plan line of the centre of handrail to test whether an agreeable falling line results from the arrangement. Another method often employed in practice is to lay off a suitable falling line first and make the widths of the steps at their well ends conform to it.

W. & A. M.

SANATORIA FOR CONSUMPTIVES.*

By BANISTER F. FLETCHER, A.R.I.B.A., F.S.I.

THE expediency of providing properly-designed sanatoria for consumptives has been much discussed of late, and attention has been drawn to the necessity for an increased number of such institutions by the recent competition instituted by his Majesty the King.

It must be borne in mind that the value of sanatoria is of a twofold nature; for not only do they act as important curative agents, and rescue many a valuable life from early death, or at least from diminished usefulness, but the discipline and habits of hygienic cleanliness carried out in them are often far-reaching in their effects.

Of the value of pure air there can be no doubt, but much can be done even under apparently very restricted surroundings. Many of the Poor Law infirmaries in London and the provinces are conferring a lasting benefit on their phthisical patients by simply treating them in the open balconies and corridors adjoining their general wards. During this last winter patients may have been seen at some of these institutions lying on a stone balcony protected only by a roughly-improvised shelter of tarpaulin and blankets on the windward side, and yet making rapid progress towards recovery in spite of cold, wet, and London fogs combined. Such surroundings are far removed from the ideal which a sanatorium should present.

An ideal situation should have an easily-drained porous soil, good protection against cold winds, and a reasonable amount of sunshine, whilst it should be far removed from densely-populated districts in which dust, smoke and other impurities are ever present in considerable amount. Many such localities may be found in our English climate, and therefore need not necessarily entail a long, tiring and expensive journey by the would-be patients, a matter of considerable importance.

It would almost seem as if we are rediscovering for the benefit of our consumptive patients the advantage of shelter which was afforded by the old English garden with its lofty yew hedges. Centuries ago or more such hedges were common, as Evelyn testifies, and even further back we see in the Temple of Æsculapius at Epidauros, in Greece, semicircular shelters formed of brick and covered with half domes in which the patients reclined to bask in the sun. The treatment, however, of phthisical cases does not consist merely in fresh air, but in special dietary and regulations made for each case.

In regard to recreation, the accompanying plan (which is a rough copy of that which I submitted, in collaboration with Mr. W. Bruce Clarke, for the King's prize essay) shows the whole of the southern front laid out in terraces and gardens for walking exercise and games such as bowls or croquet. Other exercises or recreations, such as photography, sketching, &c., will find a place when the doctor permits; but these occupations, as well as chess, draughts, dominoes, or even reading, must, during the early periods of the patient's stay, be determined by his general condition.

In preparing the design the first important thing to determine was whether to adopt a cottage or block system (as at Nordrach) or a concentrated type of plan in which the various departments should be under one roof. Having regard to efficiency of working and the climatic conditions prevailing in England, we decided on the latter type.

It is essential that plenty of fresh air and sunshine should be provided, accompanied by shelter from prevailing winds. With a view to ensure this, the patients' rooms should in all cases face south, and the buildings generally be so arranged as to afford shelter from the north and east.

Administration: Officials.

The sanatorium is planned for 100 patients (twelve paying patients and eighty-eight non-paying patients). The number of officials, servants, &c., for whom accommodation has been provided are as follows:—

Three qualified medical officers. It has been found that not more than about forty patients can be satisfactorily attended to by one doctor. In this instance, therefore, we have assumed that three doctors will be necessary. A detached house to the north of the main building has been provided for the principal medical officer. It has been placed in this situation so that he may be in full view of the chief entrance and have knowledge of all persons entering the grounds.

The quarters for the two junior officers are in the main building, as are also those for the chaplain, secretary and kitchen clerk. The two latter would certainly require to be on the spot, and must sleep either in or near the building. The chaplain might or might not do so; in many sanatoria no attempt has been made to provide for him.

The matron's quarters consist of two sitting-rooms, three bedrooms, bathroom and office, and allow her to have a servant of her own. This is about the usual amount of space assigned to her in most hospitals and infirmaries in London.

Thirty bedrooms in all have been provided for nurses, which is probably in excess of what is needed. The following nursing staff would certainly be required:—On day duty: Two sisters on the ground floor for the twelve paying patients; one sister on the first floor, with four nurses for forty-four patients; one sister on the second floor, with four nurses for forty-four patients. On night duty: one night superintendent and three nurses, one on each floor. Extras: one home sister to look after the general arrangements of the nurses' floor, and four nurses for extra duty, in the event of nurses being ill or away, or the extra nurses being required for patients. This brings the total nursing staff, exclusive of the matron, to twenty, but several more will be needed if weak patients are allowed to be about in the grounds, where they will require the services of a nurse at frequent intervals.

In the servants' quarters (north block) separate rooms are provided for the housekeeper and assistant housekeeper and eight bedrooms capable of containing two beds each for the wardmaids and other female servants. Five or six wardmaids would be required for the patients, leaving ten beds for the remaining female servants.

Eleven bedrooms, each capable of containing two beds, are all that is needed for the porters and men servants, especially as there is no reason why some of them at any rate should not sleep outside the building. Such details as these must be calculated, as on them depends the general arrangement of the plan.

General Arrangement.

First and foremost we have borne in mind that sunlight is required for all the living-rooms of the patients; hence, they all face south. With such a condition, some sort of plan as that which is proposed seems necessary. Thus the general scheme resolves itself into an inverted Y in which the patients are placed in the two forks, the administration in the shank, and the service in the northern cross-pieces. To the south are situated the sunk gardens, fishponds, sun-shelters, tennis-courts and bowling greens, and an attempt has been made to give this the appearance of an old English garden by yew hedges and a formal arrangement.

A shelter has this advantage when it is made to face different directions (as those on the ground floor), that by means of a single or possibly a double-glass screen the temperature may be rapidly altered from hot to cold, so that the patients may bask in the warm sunshine if the cold north-easter prevails, whilst in the heat of midsummer a cool northern aspect is readily available to keep them comfortable. If both sides are closed, as they readily can be, a winter garden is at once extemporized. Shelters are provided within the buildings and in the grounds.

---

* A paper read before the Leicester Society of Architects on January 29th, 1903.

Immediately to the north of the main block of buildings is situated the chief medical officer's house, so arranged that his principal living-rooms may face south.

The mortuary (with research laboratory over) is arranged in a sufficiently remote position to the west, but of easy access. Provision should, where possible, be made for scientific research in these institutions. The extent to which such research is to be carried out would depend on the time which the medical staff or their assistants could give to it. Under these circumstances it has seemed best to provide at a little distance from the main building a small block in which could be accommodated a mortuary and mortuary chapel, a post-mortem room, with rooms over for research purposes. It may possibly be contended that no deaths are likely to occur and no post-mortem examinations are therefore likely to be made. However unlikely this is, and it may be readily conceded that they would not be frequent, it seemed hardly wise not to make some provision of the kind, and a research laboratory is most conveniently placed in proximity to a post-mortem room. Even if the opportunities for microscopic examinations were seldom afforded, bacteriology would certainly be demanded.

A basement is provided for heating purposes and storage. A cold chamber for refrigerating the dead bodies is provided of such a size that it could be fitted with a Hall's brine-feeding machine. Part of the basement could be devoted to a centrifuger. One of the best of these, which is in use at the recently-opened pathological laboratory at Oxford, is made by Runne of Heidelberg, and while capable of making 2,800 revolutions a minute, does not occupy much space.

The ground floor of this research block is occupied by the post-mortem room, mortuary and mortuary chapel, with staircase leading to the research laboratory above. On the first floor is a room for microscopic work on the north, one for bacteriological research and microphotography, and a private room where the pathological worker could have access to books and papers. Such a research laboratory could accommodate three or four workers with ease, and could be readily enlarged to make room for as many more as might be required.

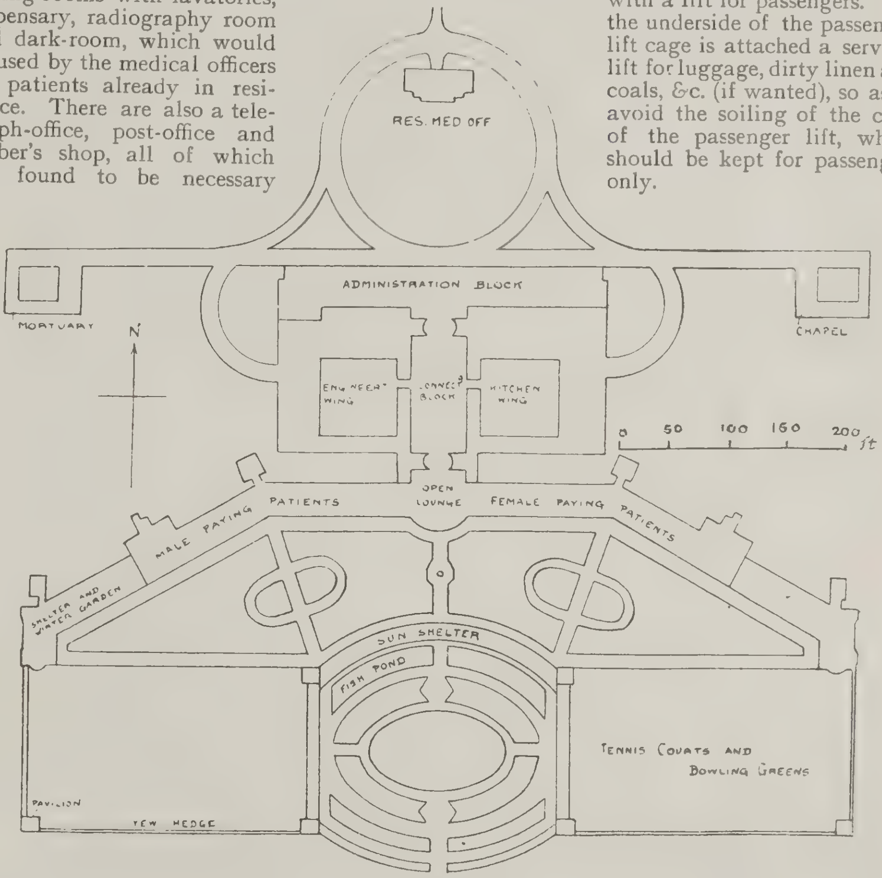
There is a lantern in the centre by which the post-mortem room obtains a good top light, and additional light is also given to the research rooms, should they want it, by the same means.

The chapel, should one be desired, is placed to the east of the site. It is quite possible, however, that the dining hall would be used for this purpose.

Ground Plan.

Taking each floor seriatim, we may thus describe the general arrangement of the scheme :—The main entrance is towards the north, and is effected through a porte-cochère or main entrance porch. A porter's lodge and telephone to all parts of the building are in close proximity. The eastern portion of this northern block contains a waiting-room for patients proposing to enter the establishment, a secretary's room, strong-room, kitchen-clerk's room and the lower portion of the matron's house, which consists of two sitting-rooms, three bedrooms, bathroom and offices, and is entirely cut off from the main building, though with ready access to it. The western block contains the medical officer's office, the consulting-room in which he can see intending patients and determine on the suitability of their cases, the chaplain's room, the board-room with lavatories attached, and the quarters for the two junior medical officers, each of whom is provided with a sitting-room and bedroom, and a joint bathroom, lavatory and w.c. Over this portion is the engineer's house, reached by a separate staircase from the yard, and described in connection with the first floor. Towards the centre of this northern block are two staircases leading to the serving-room attached to the dining-hall on the first floor, and to the male and female servants' bedrooms.

The connecting block between the administration and the patients' quarters has a central corridor, off which are two consulting-rooms with lavatories, dispensary, radiography room and dark-room, which would be used by the medical officers for patients already in residence. There are also a telegraph-office, post-office and barber's shop, all of which are found to be necessary in sanatoria. The remainder of this portion is given up to the servery, with lifts to dining hall on first floor, nurses' dining-room, servants' dining-room and housekeeper's room, &c. ; thus making these several departments easy of access for all purposes.



To the east of this connecting block is the kitchen block, cut off by a ventilating lobby from the main building. This block contains a central kitchen, 30ft. square, carried up above the surrounding rooms and lit from high windows. Around this compartment are placed the pantries, larders, refrigerating rooms, sculleries and storerooms, all disconnected from the kitchen and thoroughly ventilated. The kitchen wing is only carried up one storey in height, so as not to interfere with the light of the surrounding buildings.

The western wing, corresponding to the kitchen wing on the east, is occupied by the laundry, disinfecting-room and engines. We gave considerable thought as to whether this could be placed with advantage so near the main building, but from previous experience are of opinion that great economy will result therefrom. All chances of vibration can be avoided, but of course the whole block could be moved to a greater distance if it should be desired. The block contains a central washhouse, 30ft. square, corresponding to the kitchen in the eastern block, and around this are arranged engine- and dynamo-rooms, accumulators, workshops, laundry, disinfecting-room, distributing rooms and drying-rooms. A disinfecting chamber has been provided in connection with the laundry, by means of which any linen, bedding, &c., can be subjected to the action of dry superheated steam, either before being washed or when specially demanded for purposes of disinfection. Any approved disinfector can be supplied for this purpose. This department should be under the charge of a competent engineer, accommodation for him being provided over the junior medical officer's quarters to the west of the entrance block.

Returning into the main corridor, with its axis north and south, and proceeding southwards, two main staircases are shown, each with a lift for passengers. To the underside of the passenger lift cage is attached a service-lift for luggage, dirty linen and coals, &c. (if wanted), so as to avoid the soiling of the cage of the passenger lift, which should be kept for passengers only.

Centrally is the great open lounge, about 50ft. long by 30ft. wide, with circular front. This may be fitted with movable screens facing the gardens, and acts as a central shelter or sun lounge. On either side of it are placed two consulting-rooms for the use of the principal medical officer when in the building, and two rooms for the matron when on duty. A ready means is thus afforded for obtaining excellent supervision of the medical treatment and of the nursing arrangements. Small rooms for boots are also provided on each side.

East and west in the inverted legs of the Y are placed the six female and six male paying patients, each having a bed- and a sitting-room 13ft. by 14ft. and 11ft. in height, thus giving a cubical capacity of 2,002ft. to each patient both in the bed- and sitting-room. Each side has a spacious corridor on the north, into which the sanitary blocks open. These latter have lavatories, bathrooms and a slop-sink. A disconnecting ventilating lobby is also provided to each.

A service block is provided off the corridor to the north, containing room for the nurses in charge, linen-room, ward kitchen, coal place, outside lift for dirty linen, coals, &c., and nurses' w.c. Each block for paying patients has also a large room, which is provided with movable screens, also a library or common meeting-room about 24ft. by 16ft. with two bay windows.

It will be noticed that the paying patients can on each side obtain access to the sun-shelters and winter gardens at each end of the façade, by means of a door of which they might be given a key; but if it were desired to keep them apart from the non-paying patients they could use their own shelter, or a portion of the grounds might be set apart for their special use. It will be observed that the rooms at the ends of the blocks are marked as sun rooms on each floor. But as there are two of these, one to each wing, their exact uses would depend on the medical superintendent, and they could be set apart for billiard-rooms, winter gardens, music-rooms, or for any form of recreation. The staircases at the extreme east and west of the façade give access to these shelters. They can also be reached by the central passenger lift, and thence through the gardens in fine weather. Lavatories for patients using the gardens are provided at the extremities of the façade.

First Floor.

The first and second floors of the south elevation are devoted to the eighty-eight non-paying patients. Twenty-two males and twenty-two females are accommodated on each floor. The northern portion contains the sitting-rooms for the men and women servants, which could be made into one large servants' hall if so desired. The eastern block of this northern block contains the housekeeper's bedroom, the assistant housekeeper's bedroom, and eight additional servants' bedrooms, including lavatories and bathrooms.

To the extreme east is the upper portion of the matron's quarters, reached by a private staircase from the ground floor. The west wing of the northern block contains the male servants' bedrooms, lavatories and bathrooms. The extreme western portion is devoted to the engineer's quarters, reached by a private staircase from the ground floor. These quarters consist of a sitting-room, living-room or kitchen, two bedrooms, bathroom and w.c. The connecting block contains a large serving-room 45ft. by 16ft., fitted up with service lights communicating with the ground-floor serving-room and a dining-hall 70ft by 45ft., covered with segmental panelled plaster ceiling. The dining-hall is thus placed in close proximity to both lifts and staircases, and is amply lighted on either side. This hall could be used also for entertainments, organ recitals, &c., and for this reason an organ gallery is placed at the the southern end, at the second-floor level, for patients whose rooms may be on the second floor and who are too weak to proceed to the body of the hall.

The southern portion of the inverted Y extends over the whole of the ground-floor rooms and shelters. Each wing contains twenty-two bedrooms 13ft. by 14ft. and 11ft. high. The male patients are to the west and the female to the east. These rooms are of the size and height as those given to the paying patients, but one room only is provided for each of them. A boot-room is provided on each side next to the central lounge and in proximity to the lifts, so that patients on arriving at this floor can change their boots before proceeding to their rooms. A room for the sister who would have charge of this floor is also provided, as well as an extra consulting-room for the medical officer, which can be used if required for minor pathological investigations.

The sanitary blocks are placed as shown, and in all cases are disconnected by cross-ventilated lobbies; it is considered, from those given in other establishments of the same nature, that they are sufficient.

The nurses' blocks, with ward kitchen, &c., are exactly similar to those on the ground floor. Cloakrooms for male and female patients are provided at the entrance to the dining-room, as it is found that confusion is thereby avoided.

One important point must be mentioned. A slightly projecting balcony is shown along the south front. It has been thought necessary to introduce this in a modified form in spite of our objection to balconies in a climate like that of England. There is perhaps no point of sanatorium construction about which so much divergence of opinion exists as that of balconies. In many sanatoria *covered* balconies are provided, in some instances running the whole length of the southern fronts, but such structures as usually constructed are, in our opinion, of somewhat doubtful advantage. It is true they afford a warm and efficient shelter for patients who are unable to stir far from the house, but they do so at the expense of the sunlight and air, which ought to be allowed to enter freely into the rooms. In the summer-time, especially in the warmer months, they are often unbearably hot, and prove enervating for the tuberculous patient, who needs fresh air and soft breezes rather than a hot sunshine.

It is to do away with the necessity for such *covered* balconies, whilst providing all that they supply in the shape of air-space, that these shelters and lounges have been provided to a greater or less extent on each floor.

In regard to the windows in the patients' rooms, three-quarters of the entire side of each room is arranged so that it can be folded back in compliance with the needs of the open-air treatment. We believe this is a novel arrangement, but one that should commend itself. It thus becomes necessary to protect the patients from any possibility of falling through the opening, and it is found that by projecting an *uncovered* balcony to a slight degree (about 2ft.) this can be effected without any diminution of the sun rays to the rooms beneath, adding a pleasing feature to the façade, as well as giving means of access for slight repairs or for the fixing of sun-blinds if they are required. A light trellis railing is placed along each balcony, and a similar one put between every room in order to ensure privacy to each patient.

Ample accommodation is provided for the recreation of patients on this floor—central lounge, day-rooms (with circular fronts) and sun rooms.

Second Floor.

The second floor is an exact duplicate of the first as far as the patients are concerned, and need not therefore be described. The connecting block of this floor contains the upper part of the dining-hall. At the north end is an organ gallery, already mentioned, and at the south a gallery for patients, above alluded to. The summer recreation-room in the centre of the north front would probably be better employed as a store-room for scenery or for extra chairs in connection with the hall.

Fire-escape stairs are provided to the patients' blocks in accordance with requirements for buildings of this nature.

Thus it will be seen that the keynote of the building arrangements has been to place the various administrative and medical departments towards the centre of the institution, the patients being located in the two wings facing nearly due south, whilst the quarters of the nurses, when they are off duty, are situated at the top of the building, where they will obtain ample fresh air and quietude. These quarters are reached with ease by the main staircase or passenger lifts.

Third Floor.

This floor is devoted entirely to accommodation for the nurses by means of three blocks, two containing bedrooms for the day nurses, and one to the north, with an east and west balcony, for the night nurses. The accommodation includes box-rooms, linen-rooms, lavatories and a large nurses' sitting-room facing due south.

Construction.

It has been assumed that a gently sloping site from north to south has been secured, and this has been taken at an inclination of about 6ft. from north to south. It was intended that fire-resisting construction should be used throughout, and one of the best and simplest kinds is that of steel joists and coke-breeze concrete. Teak or oak floor-boards in narrow widths can be nailed direct to this, and kept thoroughly clean by a periodical treatment of wax and turpentine. Parquet-flooring on ordinary floor-boards might be used instead, and smooth plain linoleum is recommended by some in preference to any of these as being cheap and less noisy. Indeed, as damp dusters were held to be the proper means of cleansing floors, any polished surface seems impossible. Hollow spaces of all kinds should be avoided, as they harbour dirt and propagate disease.

The floors of the sanitary wings are formed of steel joists and concrete, and would be covered with mosaic or terrazzo-flooring laid to a slight slope so that they could be thoroughly flushed down periodically. The walls would be constructed of good, hard, well-burnt bricks, rough-cast on the outside. The sitting-rooms might be lined to a height of 5ft. with glazed hanging tiles, allowing frequent cleansing. Above this the wall would be covered with some hard non-absorbent cement, such as Keen's or plaster-of-Paris, which could be periodically distempered or painted. Varnishing is a mistake, as moisture condenses on it.

No mouldings, protecting cornices, or skirtings would be used, and the junction of the wall with the ceiling and the floor would be made with rounded corners. The ceilings would also be treated in this hard plaster distempered. The sanitary blocks would have their walls lined throughout with tiles to a height of 5ft., with rounded angles at top and bottom.

As to the window openings, we designed a window front to each room which can be folded back or taken out if desired. The window-frame should be made of teak or oak, no mouldings being allowed, but only rounded corners. These windows can be arranged to swing round into the corners, so that three-quarters of the outer wall of the room can be thrown completely open.

The roofs are covered with red tiles. For many reasons these are better than slates, as they render the rooms underneath of a more equable temperature in summer and winter. In order, however, to effect this in a thoroughly trustworthy manner, the roofs would be constructed of steel rafters, with concrete between, and having mortar in which the tiles would be embedded solid without nails.

The furniture of the patients' rooms must be simple in character, so as to permit frequent disinfecting, cleaning and renewal if needed. An iron bedstead, with a "Lawson Tait" wire-wove mattress and the usual complement of sheets and blankets, is all that would be necessary in the shape of bedding. A simple iron washstand enclosed as little as possible, with enamelled iron basin, jug and crockery, a chest of drawers, a chair or two and a movable bookcase, and a rug or two on the floor, would complete what was necessary. Some deviations from the routine furniture would no doubt be permitted in individual cases, especially when dealing with paying patients.

(Mr. Fletcher concluded with the sanitation of the building, such as the disposal of sewage, the ventilation, the various forms of fittings, the modes of lighting, the water supply and other details.)

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, 9. *East Harding Street, E.C.*

Bridlington.—For the erection of an isolation hospital in Bempton Lane, for the Corporation :—

E. Corner	£4, 00	0
Sampson & Siddall	3,587	6
A. Gardam	3,576	0
Smallwood & Shaw	3,570	0

Simplex Conduits.
The "Simplex Steel Conduit System" is now recognised by all the leading authorities to be the **best method** of installing Electric Wires. It is now almost **exclusively employed** for all kinds of installation work.
ECONOMY and EFFICIENCY
are secured by the use of Simplex. Do not be satisfied with imitations. Every Conduit and Fitting stamped "Simplex."
We are devoting a big factory and all our energies to the bringing out of one product, and it is owing to this concentration of all our efforts that our system to-day stands in the **very front rank** of wiring systems.

A PROFITABLE BUSINESS OF YOUR OWN!

A GENUINE OPPORTUNITY.

Our organization of AUTOMATIC ADDRESSING BUREAUX, extending throughout the United Kingdom, offers a splendid opportunity of establishing, in your Town or District, a remarkably profitable business of your own, connected with a co-operative enterprise quite unique in the world. Briefly stated, our proposition is the following:—

If you will establish, in your Town or District, an ADDRESSING BUREAU, and agree to organise and conduct same on the lines upon which our own is based, we will grant you a License giving you the right to the use of our name, in addition to other valuable privileges.

Only one License will be granted in each Town or District. There will be no overlapping.

The enterprise is of FAR-REACHING UTILITY, and is based on an entirely NEW BUSINESS principle.

For full particulars write at once, mentioning this publication and enclosing stamp for reply.

C. Southam & Son, Wigston	245	0

* Accepted. [Rest of Leicester.]

Trade and Craft.

Young & Marten's New Catalogue.

The new catalogue (tariff No. 27) which has just been issued by Messrs. Young & Marten, Ltd., Caledonian Works, Stratford, London, E., includes everything that a builder needs, and is a very useful book of reference. Among the innumerable illustrations, many of them coloured, we notice some from photographs of chimney-pieces in pine, whitewood, oak, walnut and mahogany: the prices of these are very moderate, ranging from 28s.—design No. R5332 is perhaps as pleasing as any, though we think it would be improved if the centre panel were omitted, or something neater substituted. Of iron mantels a great variety is shown, several of them departing widely from the old models and exhibiting decided influences of the "Arts and Crafts" movement, such as the "Coburg," the "Eastney," the "Crescent," the "Fawcett," the "Burnet," the "Hardwick" and the "Acacia" (the last two are very good designs). Some dozens of tiles are illustrated in the catalogue, and a large number of designs for leaded cathedral lights, embossed, stained and painted glass, fascias and stall plates. Plumbers' brasswork is very fully dealt with, all kinds of taps, plugs and gratings being shown; and there is a similarly extensive variety of cisterns, cowls, ventilators, pumps, baths, closets, and lavatory basins. Indeed, every requisite of a builder is shown. It would serve no purpose to enumerate a tithe of them, and we cannot do better than refer readers to the catalogue itself.

Coming Events.

Wednesday, April 15.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Associates' General Meeting at 8 p.m.

Saturday, April 18.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Edinburgh of the Glasgow Architectural Association.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

April 22, 1903. Vol. 17, No. 428. 9, East Harding Street, E.C.

Americanized Labour. ALMOST coincident with the reports of Mr. Alfred Mosely's Industrial Commission to the United States comes the news that the Board of the Building Trades in New York, representing 60,000 men, and said to be the strongest labour organization in the United States, threatens a strike on May 1st if the demands for increased wages, ranging from 10 per cent. in some branches to 20 per cent. in others, are not granted. During the last few years, which have seen an unprecedented activity in the building trade of New York, workmen have not only shared in the general prosperity by having nearly all their demands satisfied, but have also so strengthened themselves as a body that, through the Board of the Building Trades, they now control practically all skilled labour in their line in and near New York. Very few workmen now receive less than 4 dollars a day, and it is believed that the employers will refuse to grant any further concessions. Turning to our own affairs, we notice that there is quite a Spring epidemic of building strikes all over the country—nothing exceptional, it is true, for the workmen are discreet in making their demands when the winter is over and at a time when their labour is most needed. The comparison between American and English methods is interesting. Mr. Mosely himself considers that the "true-born American is a better-educated, better-housed, better-fed, better-clothed and more energetic man than his British brother, and infinitely more sober; as a natural consequence, he is more capable of using his brains as well as his hands." But this conclusion is by no means generally endorsed by the delegates, who, it will be remembered, represented twenty-three trade unions of this country, and were taken by Mr. Mosely for two months last year to study American methods But, though they do not all admit that the American workman works harder than his British *confrère*, it is agreed that the production per man is greater, the difference being attributed to better organization, labour-saving machinery, worse quality of product, &c. Mr. Taylor's opinion is that the average output (in bulk) of the bricklayer in America is greater than here, but he maintains that American bricklaying is so different in character and generally so much rougher that to make a proper comparison is very difficult; in his view the British bricklayer gives better value for his money than the American, the contrast being between a smaller quantity of better quality for a low wage and a larger quantity of lower quality for a much higher wage. Mr. Deller says the American plasterer "undoubtedly covers more ground than we in England do, but the quality is very inferior." His report, indeed, is full of the badness of the work and of the conditions under which it is carried out. At the post office at Buffalo, "a fine building," he says, there is "plenty of plastering of fairly good design, but executed in such a manner as to make it a standing disgrace to the trade." And so on. Meanwhile we may remember what has been done at the Westinghouse Works at Manchester, and what is now in progress at the Savoy Hotel extensions under the same direction. The secret of the whole matter is that under the American system the workman is paid better wages, is energetically supervised, provided with labour-saving machinery and taught to use his brains. English contractors would do well to embody these methods with their own.

The Normans in Britain. A COLLECTION of about two hundred photographs of Norman tympana and doorheads existing in churches throughout Great Britain is now on exhibition in the entrance corridor to the Guildhall library. We congratulate Mr. Charles E. Keyser, F.S.A., on this admirable collection, though it is to be regretted that such inadequate provision should have been made for it—photographs, even though large, can hardly be examined when they are placed 10ft. and more to the ceiling, and one would have thought that the Guildhall authorities could at least have found some room where so interesting a collection might have been exhibited in a proper manner: as it is, only those photographs on about eye-line can be carefully examined. We would recommend all those who are interested in Norman work to visit this exhibition. They will find that Mr. Keyser has most exhaustively recorded the examples all over the kingdom—in small churches in out-of-the-way districts as well as in cathedral cities—and as the photographs are large and uniform in size they can be studied and compared most profitably. The Norman zigzag and chevron, the rude carving and symbolical reliefs are well rendered; the texture of the stone being remarkably well shown. The period covered extends from 1060 to 1180.

Further Market Report. ENCOURAGING reports from the allied societies created a firmer feeling in the Architectural Money-market, though registration received something of a set-back, owing to quiet Institute advices. Drawing was on a small scale. The plan factories, however, maintained a steady output, and several secured work for leading positions in London. The Liverpool market was quiet, but some business took place in baths and libraries. Cathedral stocks engaged attention. Tappers were offered at 10¼–10½, and A. and P.'s at 10⅖, while Starks, Scotts and Nicholsons hardened a trifle. Emersons were deferred. The country-house market exhibited some signs of life, due to the efforts of the Amalgamated Society of Cribbers. Arts and Crafts found ready buyers, but showed considerable unsteadiness, especially in furniture: raw material was in abundance, and spot parcels were going at a low rate. Nouveau wriggled somewhat, but showed little signs of improvement. Spiers had an upward tendency, and Orders were readily placed. Norman Shaws seemed to have retired from the market, though something was done with Gaiety Theatres. Aston Webbs made more money, SKs. rising considerably despite weather conditions. There was a good deal of frost about the competition market, but this did not check prospectors, and reports from all over the country show extensive drawings. Architectural Vigilance was steady, but consumers were rather disposed to hold off owing to the uncertainty of the situation. Exeter glass was at a discount, several observers being averse to Peckitts changing hands. R.I.B.A. stock showed no change. A.A. ducklings were, as usual, well to the front, though a movement is expected in the summer. A steady business was done in Hare town-halls and there was some demand for Belcher offices at high rates. In the rough-cast market Voysey houses were healthy, several f.o.b. quotations being received; but elsewhere the eaves showed a drooping tendency; rainwater butts created a general demand. There was a great rush for Academy perspectives exhibiting the latest optical illusions. Iron was hard but showed signs of decay. Cement hardened but bricks came down, and there was a sharp fall in campaniles, which unfavourably affected the bumper traffic. A very large consumptive business is being done in Sanatoria.

GLASGOW INSTITUTE OF ARCHITECTS.

Annual General Meeting.

At the recent annual general meeting of this Institute—Mr. Horatio K. Bromhead, F.R.I.B.A., president, in the chair—the secretary read the thirty-fifth annual report. Reference was made in it to the sixth triennial competition for the Alexander Thomson travelling studentship which was held in February and for which five sets of drawings were sent in, coming respectively from London, Liverpool, Edinburgh and Glasgow (two sets). While the trustees would gladly see a larger response in the number of competitors, they have reason to be gratified not only by the wide area from which these were drawn but by the high standard of excellence reached in most, if not all, of the works submitted. It had been decided that, should the results warrant it, a second prize of £20 (with somewhat similar conditions to those attached to the scholarship itself) should be awarded on this occasion.

The president, in moving the adoption of the report, said it appeared to him that the most remarkable event of the past year was the way in which the housing question had been thrust forward. The housing problem was a scarcity of small houses that the poor could and would like to live in. Usually the subject was regarded as like a jellyfish, without any backbone of its own, something that was nasty and must be pushed with a stick. But the backbone of the subject was the will, the desire of the poor. If the city were taxed to provide a new department in which working men could get a really good black frockcoat and white gloves at half their value, would they go and buy them? Not a bit of it. But if an addition to the Police Act compelled them to buy, what then? Why, it would be found that the working man had a command of language quite beyond what was known of him. He wanted "shoddy." It was shoddy houses that were wanted for the poor—cheap and wholesome houses that a man could pay an honest rent for, without the degradation of knowing that he was being made a pauper by having his rent partly paid by taxes on other people. How were we to get these houses? If we got rid of our purse-proudishness about the cost of our buildings, and got rid of the cruel exactions of our Police and Building Acts, and were to strive to have, right within the city bounds, districts where we might be proud of knowing that working people could and would like to live cheaply and comfortably, and yet where capital would not be cheated, we should have an ideal that would lead in a sound direction. In the Liverpool City Council it was said that if they went on building for 2,000 people every year for fifty years they might make up arrears. In Glasgow a million pounds would be a mere drop of what was required.

Speaking of the Glasgow Royal Infirmary reconstruction scheme, he said it was still on the horns of a dilemma. The governing power had a plan that, according to American phraseology, "can't be beat," and so they issued this plan to a few architects in a competition for decorating it. But alas! architectural human nature was also weak. Not only did several of the architects venture to improve, or should he say alter, the "immaculate" plan, but the architectural assessor considered these the best, and gave his award accordingly. The committee, however, were equal to the emergency. They overruled the assessor's award and chose the design that most closely followed their own "immaculate" one. Possibly they thought that its "immaculateness" far outweighed any and all of the bad and miserable features that might have been discovered in the design by the assessor.

The Council for ensuing year was elected as follows:—Messrs. J. A. Morris, David Barclay, A. N. Paterson, John Keppie, H. K. Bromhead, James Lindsay, N. Macwhannell, T. L. Watson, J. M. Monro, Alexander M'Gibbon, J. A. Campbell, A. Balfour, W. J. Boston, Charles Gourlay, T. Baird, jun., and Andrew Black. The treasurer's accounts, which were submitted and approved, showed that the funds were in a satisfactory position. A meeting of the newly-elected Council followed, at which office-bearers for the year were appointed:—President, Mr. Horatio K. Bromhead, F.R.I.B.A.; vice-president, Mr. John Keppie; auditor, Mr. David Barclay, F.R.I.B.A.; secretary and treasurer, Mr. C. J. Maclean. The various committees for the year were also appointed, including committees on public architecture and on architectural education, &c.

Correspondence.

Buildings in the Abergavenny District.

To the Editor of The Builders' Journal.

London, S.W.

Sir,—Allow me to suggest as buildings to measure:—(1) Raglan Castle (about 9 miles), vigorous but rather coarse in detail. (2) Kilpeck Church, almost pure Norman throughout with good and elaborate detail and an apse—a very good subject. (3) Tintern, of course; but I fancy measuring is not allowed now. (4) St. Mary's, Abergavenny, is disappointing, but has some interesting monuments in the Herbert Chapel. (5) Llanthony Abbey (9 miles), interesting, of the Augustine foundation, Early English. (6) Crickhowell, a small but charming church. Burrow's "Gate of Wales," 6d. (published by Burrow, of Cheltenham), will give your correspondent views, plans, &c. (except of Kilpeck), and he can form his own judgment before visiting.—Yours truly,

PHILIP A. ROBSON, A.R.I.B.A.

The Yeovil Competition.

To the Editor of The Builders' Journal.

10, Gray's Inn Square, W.C.

Sir,—The following facts relating to the above competition may prove of interest to your readers, and may serve as a warning to intending competitors.

On January 24th last a notice appeared in the "Somerset Herald" to the effect that the Corporation of Yeovil intended to invite competitive plans for the development of some Corporation property in High Street and South Street. Provision was to be made for a Technical Institute, Free Library, Town Hall, Municipal Offices, Corn Exchange, fish, vegetable and fruit market, Fire Station, together with Justices' Rooms, County Court, Mayor's Parlour, &c. In addition to these as much as possible of the ground floor in High Street was to be laid out for shops, and the competitors were to decide whether there should be a wide street or a covered arcade in place of a court which at present connects High Street with South Street.

Premiums of 20 and 10 guineas were offered for the schemes placed first and second respectively.

It was to be understood that the Council had no intention of proceeding immediately with carrying out the whole scheme, the idea being to begin with the Free Library and Technical Institute.

The attention of the Royal Institute of British Architects was called to the matter, and a letter was written by their secretary to the Corporation pointing out the inadequacy of the premiums and urging the appointment of a professional assessor to draw up the conditions upon the basis of the Institute's "Suggestions." In the meantime the members of the Competition Reform Society had been requested to abstain from competing. No notice being taken by the Yeovil Corporation of the R.I.B.A.'s letters, a statement to that effect was published in the R.I.B.A. Journal of March 21st with a request that the members of the Institute should abstain from entering the competition.

I have recently received a copy of the list of the Council's replies to the competitors' questions arising out of the conditions and particulars issued by the Town Council for the guidance of architects. The following extracts will give an idea of the spirit in which the competition has been conceived:—

Questions.	Replies.
1. Will the architects whose design is chosen be engaged to carry out the buildings as the Council's architect?	Not necessarily.
2. Should any amount as regards cost be considered in designing? If so, how much?	No Arrangement to be considered only. Question of cost will be considered in carrying out.
4. Is there any likelihood that the conditions will be at all revised as the premiums offered seem low for the value of work required?	No.
36. Will the Corporation give a guarantee that the author of the selected design will be employed to carry out the work?	No.
38. Will a professional assessor be appointed to adjudicate upon the schemes?	No.

These particulars will be sufficient to show that the Yeovil Corporation expects to receive schemes for laying-out a large area of ground. The planning of the schemes should entail considerably more work than will be apparent upon the plans submitted, for in justice to the Corporation it must be stated that "detail plans of the various buildings are not required," although explanatory drawings to a larger scale (⅛in.) may be submitted at the architect's option.

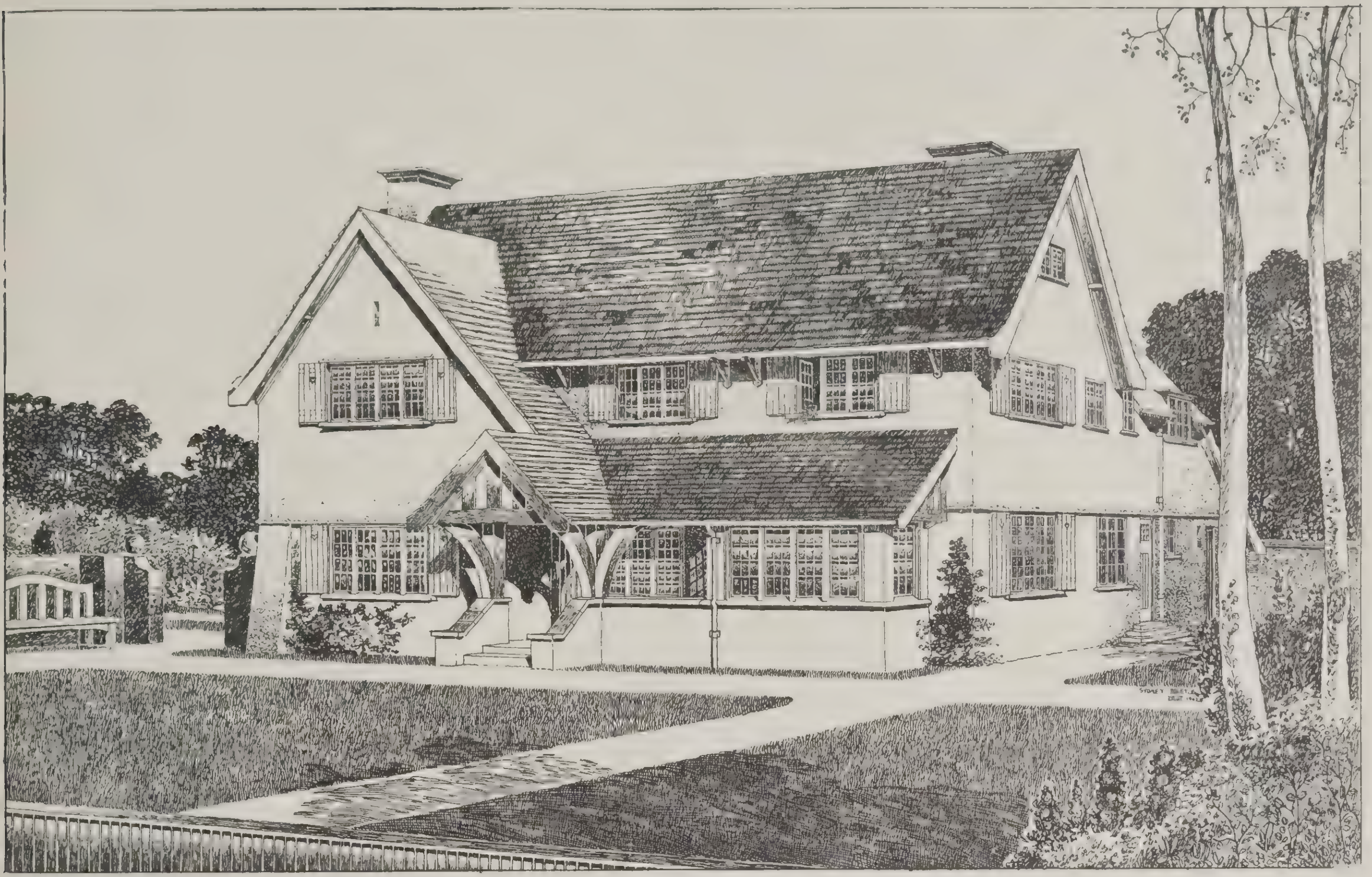
For the very considerable amount of thought, work and special knowledge which would have to be displayed in the preparation of a scheme in order that it might do credit alike to the competition and the town of Yeovil, the following inducements are offered:—(1) Premiums of 20 and 10 guineas respectively to the authors of the two designs placed first. (2) No professional assessor. (3) No undertaking that the author of the selected design will be engaged as the Corporation's architect, or that he shall be employed to carry out the work.

Unfortunately for Yeovil there have been at least thirty applications for the conditions, and there seems little doubt that a certain number of designs will be submitted. It has been ascertained that the Corporation has little or no money to spend upon the majority of the buildings. Mr. Carnegie has promised £2,500 for a Free Library, and there is a similar sum available for a Technical Institute, one or both of which may be erected shortly.

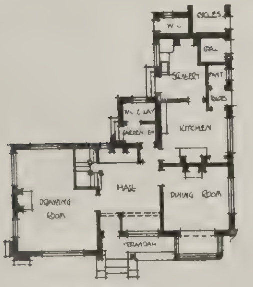
It is satisfactory to know that the architects of Yeovil have no intention of competing, and that they have already made their protest to the Corporation. It is to be hoped that all architect-readers of your Journal will do likewise and so assist in making of the Yeovil Competition as big a failure as the recent case of the St. Ives Municipal Buildings.—Yours truly,

HENRY A. SAUL.
Hon. Sec., Competition Reform Society.

House at Wimbledon, Surrey.—This house is now completed, and stands in the Belvedere Grove. The walls are externally covered with soft cream rough-cast, and the roofs with Reading tiles. The woodwork to porch is in Oregon pine. The woodwork to windows is painted green, and the iron-work black. Internally the hall is treated in oak. Mr. A. J. Hardwick, of Kingston, was the architect, and Mr. E. D. Hobbs, of Thames Ditton, Surrey, the builder.



HOUSE AT WIMBLEDON. A. JESSOP HARDWICK, ARCHITECT.



MODERN ARCHITECTURE.

MR. CHARLES OWER delivered a lecture on "Modern Architecture" before the Dundee Institute of Architecture, Science and Art last week. Mr. A. A. Symon, the president, occupied the chair. Mr. Ower said he believed architecture was more necessary to our happy existence than any other art. Architecture was not building, and it was certainly not designing. It was the art of designing and building in such a manner that the completed work was durable, healthful, useful, interesting and pleasing to the eye. The combination of technical constructive skill with imagination differentiated architecture from the other fine arts of painting, sculpture and music. Patrons of the art were so increased in number that to the best of his belief there were more buildings of an architectural character produced in ten years at the present time than were erected in the whole ancient and mediæval world during the period preceding the Renaissance of architecture in Italy in the fourteenth century. If all the ancient styles had produced beautiful buildings, being diverse, he maintained that at the present time among the multitude of buildings being erected there were works which were worthy to be ranked with the ancient examples. The distinctive spirit of modern architecture was the selection of the beautiful in design and materials, and the use of the same without relation to any special style or convention. The time was past, but not long past, when some of the rigidly architectural righteous would have argued that without adherence to style there could be no beauty. In simplicity lay their greatest hope for the architectural future, but that should not be an excuse for poverty of design and materials. Moderns ought to know the principles which guided the great designers in the past. It would be found, however, that the conditions of life as now existing, as well as the new materials which were available for use in building, were so entirely different from what operated in the past that the true test of architectural ability was not how closely could a copy be made of some past designer's work, but how completely could the work be made to serve the purposes of everyday life, and to use the new materials in such manner that the resulting building shall be beautiful, useful and not wasteful. After illustrating this point of view by commenting upon various examples, he went on to say that modern architecture had an immense field before it in utilising new methods and materials. It was already showing the effect of the change in roof forms. The modern architect had many considerations to weigh in designing any building, and the first was utility. Modern churches, owing to the influence of the clergy, continued to be learned reproductions of a dead style. In all parts of the civilised world works had been executed lately in which much originality in design had been conspicuous. In Britain, America and Germany some very great works had been undertaken, and in France there had been much work remarkable for its requisite detail and excellent taste. Mr. Ower showed a large number of slides of notable new buildings in this country and the Continent.

LIVERPOOL BATHS COMPETITION.

THE drawings submitted in the important competition of the Liverpool Corporation for baths and tramway offices on the St. George's Dock site present most interesting subjects for study.

The bottom of the dock is between 30ft. to 40ft below the street level, and is in shape a trapezium with the narrowest side facing the river frontage. Under the conditions of competition, it was left to the competitors to suggest the positions of the baths, whether at the bottom of the dock, at a level with the street, or in any other position preferred by the competitor, the main stipulations being that the tramway offices should face the river, that the external treatment of the building should harmonize with that of the intended new Dock Board Offices adjacent, that there should be certain accommodation provided in the baths and tramway offices, and that other portions of the building should be devoted to letting offices.

In the majority of the designs submitted their authors seem to have expected that the Corporation would desire a building as much like the Dock Board Offices as decency would permit, and that the development of architecture from the straightforward designing of a building to fulfil its purpose and to honestly express its intention would not meet with any success or encouragement.

The designs number seventeen, and may be tabulated into two main groups: (1) those which express distinct buildings for baths, tramway offices and letting-offices, and (2) those which cloak the separate purpose of each division (especially that of the swimming baths) by a shell, or mask, which suggests nothing so much as a second set of dock board offices having its inside portions cleared away to make space for baths or other buildings. The first-premiated design belongs to this latter group.

It seems obvious to us that the treatment of a building should follow its plan and purpose, and to group together, as an undefined whole, buildings having such widely different purposes as those of swimming baths, Turkish and slipper baths, tramway offices and letting-offices, in a way quite undistinguishable from the suggested purpose of the adjacent Dock Board Offices, is one of the worst possible degradations of the art of building, and certainly cannot be termed architecture. For the reasons above we think the result of this competition disappointing, architecturally. From a purely practical point of view, also, we think the designs submitted do not in any one of them exhibit that grasp of the requirements of the situation which would lead to wholly convenient buildings being erected therefrom. Individual parts of the different designs may exhibit simplicity and directness of plan in some one or more respects, but there is not one design which in our opinion is uniformly successful in the arrangement of the men's first- and second-class and women's swimming baths, the men's and women's Turkish, Russian and slipper baths, the approaches thereto, the tramway offices and the letting-offices. In the Turkish, Russian and slipper baths, especially, there is no one design whose author has fully recognized and met the necessities of a well-arranged suite of such baths; no easy matter, we admit, to achieve, but still worthy of further struggles to accomplish. We are inclined to think that the reason for the failure of this competition to bring forward a thoroughly well-conceived design, architecturally speaking (which, of course, means also practically speaking), is the stipulation that the intended Dock Board Offices adjacent should be the keynote for the external treatment of the Corporation building, and the inclusion of too many buildings within the site. We do not, as a rule, recommend competitions, and much less repeated competitions, but a competition having been held in this case, the result being, in our opinion, so unsatisfactory, and the site and buildings being of so important a character, we should like to see, in this particular instance, a new competition inaugurated upon the lines we have suggested; and we think a happier design might then be forthcoming.

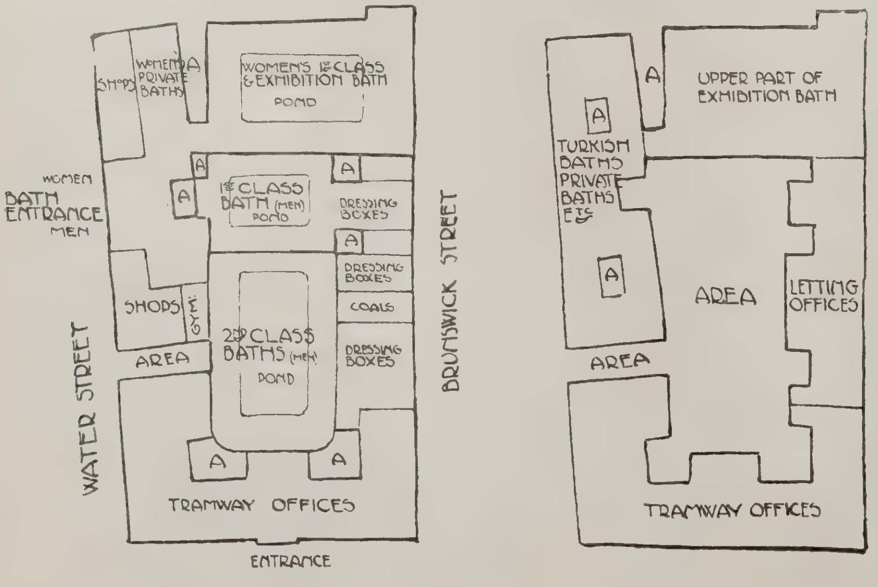
We shall now briefly refer to the several designs submitted.

Design No. 11. 1st Premiated. Messrs. Stones & Stones, of Blackburn, with Mr. W. E. Sproat, of Glasgow.—In this design the authors have conveniently ignored the actual site, and have squared it up to suit their building.

This is one of the designs of the hollow shell type before referred to, and conveys the suggestion of dock board offices, municipal buildings, or a town hall, but certainly not of baths. There is a multiplicity of entrances for the different departments, and the latter overlap each other instead of being separately blocked together, the result being that the baths are darkened by superimposed buildings, whilst the latter are rendered noisy and unsatisfactory by the baths below them. The boiler-room, placed under the pond of the second-class men's swimming bath, would probably be a source of trouble in the future by affecting the temperature and the water-tightness of the pond. The baths and corridors are, as a whole, ill-lighted, the most glaring instance being that of the first-class men's swimming bath, half of which is covered by other buildings. By the assessor's award, it appears to be admitted that in plan this design leaves much to be desired, and we are inclined to think that a further study of some of the other designs would not lead to the selection of this particular one as the first premiated by reason of its exterior treatment. The elevations of the Dock Board Offices strongly inspire this design, the substitution of a rather tamely-detailed tower for the dome of the former building being the most notable variation. The effective drawing of the perspective view has, perhaps, had much to do with the favourable position in the competition which this design has obtained.

No 14

Design No. 3. 2nd Premiated. Messrs. Briggs & Wolstenholme, with Messrs. Arnold, Thornley & Hobbs, of Liverpool.—The most notable feature of this design is the concentration of the entrances for all classes and sexes using the baths upon one point, and the central position of the superintendent's office at that point. This idea has merit, economically; but in this country of class and sex distinction it would probably not meet with the approval of all the wished-for users of the baths. The swimming baths are placed at about 7ft. below the street level, and a large portion of the lower part of the old dock is not utilized. The tramway offices, the exhibition bath (women's swimming bath), the Turkish, Russian and slipper baths, and the letting offices, are distinct blocks of buildings, but are not happily treated, the exhibition bath alone expressing its purpose as a separate self-contained building.



GROUND-FLOOR PLAN. FIRST-FLOOR PLAN.

NO. 3.

The exterior treatment of the building is somewhat halting and tame, the exhibition bath, especially its entrances, being, however, bolder and more interesting than the remainder. The effort appears to have been to group the several departments as a whole so as to make a block of buildings as similar in proportion to the Dock Board Offices as possible, whilst endeavouring to present a contrast in the detail of the two buildings.

Design No. 5. 3rd Premiated. Mr. Huon A. Matear, of Liverpool, with Messrs. Simon & Crawford, of Liverpool and Manchester. —This design in the grouping of the buildings and their treatment is a most welcome change from the designs placed first and second. The authors have recognized that baths are baths, and not dock board offices, and have striven to work out their design accordingly. The grouping is good, but the working out of the buildings is architecturally poor and uninteresting, the baths block being less so, perhaps, than the tramway offices and the letting-offices, though the screen wall connecting these upon the Water Street side, as shown in the perspective view, is suggestive of a piazza rather than of the end wall of one of the swimming-baths, with the ridge ventilators of the bath roof appearing above the wall. These ventilators have been conveniently omitted in the perspective view. The architectural treatment of the interior is mediocre, and is especially disappointing in respect of the men's Turkish baths, the plan of which led us to expect a rather pleasing architectural treatment which has not been realised in pseudo-Oriental orthodoxy. Several parts of the buildings are happily planned and are quite simple and direct; and we cannot help wishing that some really good ideas which the design suggests have not been better worked out and treated in a more scholarly manner.

Design No. 1.—A somewhat indirect and involved plan, and the elevations without particular interest.

Design No. 2.—The swimming-baths are

an entirely detached building within a mask of narrow buildings on three sides of the site, and an open colonnaded screen on the fourth side. Use is made of the entire area of the old dock for warehousing or other purposes. The swimming-baths are fairly planned, but spoiled by the Turkish and slipper baths being placed over portions of them, and the latter are not thoroughly worked out.

Design No. 4.—A rather crude and undigested scheme.

Design No. 6.—This design does not call for special comment.

Design No. 7.—The design as a whole is disjointed, the exhibition bath is small and not well planned, and the approaches are unsatisfactory.

Design No. 8.—A simple and direct plan having possibilities, the elevations rather commonplace. The swimming-baths are placed in the centre and masked by an U-shaped screen of narrow buildings.

Design No. 9.—The baths are arranged in the centre and masked by screen blocks of narrow buildings on three sides, and by an open colonnade on the fourth side. The design of the building does not disclose its purpose, but it is quiet and restrained, and has interest.

Design No. 10.—This design shows a satisfactory treatment of the angles of a large edifice, and the detail is pleasing and scholarly; but the building does not suggest its purpose.

Design No. 12.—Another example of the swimming-baths grouped into the centre of the site and masked by other buildings.

Design No. 13.—Some of the individual departments exhibit good straightforward planning, but the arrangement as a whole is scattered, the external treatment is in parts successful but not uniformly good, and the skyline is ineffective.

Design No. 14.—An economically designed building, both in plan and elevation, and in many respects a departure from the style of work prevailing throughout the other designs, but scarcely harmonizing with the Dock Board Offices, and rather suggestive of the "Glasgow School." Has a certain freshness of interest in parts, but somewhat monotonous as a whole. The tower is good.

Design No. 15.—Offices arranged over the baths, to the detriment of both as regards light and quietude respectively. Baths all arranged in the basement and consequently a large area devoted to letting-offices.

Design No. 16.—Some good ideas not well worked out; the swimming-baths placed above each other are not satisfactory, but the design has interest as being an attempt to treat the baths as a separate building expressing its purpose.

Design No. 17.—The elevations might have been more pleasing had one attic storey been omitted. The swimming-baths are arranged in the centre of the site, and the several blocks of departments are well concentrated; but some of the approaches are lengthy, ill-lighted and indirect, and the design, as a whole, is not quite happily conceived and developed.

A block of Flats is to be erected in the Moscow Road, Bayswater, to be called "Queen's Court," under the direction of Messrs. Palgrave & Co., architects, Westminster. The building will consist of thirty self-contained residential flats ranging from six to eight rooms. The elevations will be carried out in red bricks with gauged brick aprons, arches, &c., and the roofs covered with green slates. There will be electric passenger lifts to all floors. Mr. C. Gray, of West Hampstead, is the contractor, and Mr. George Stephenson, of Queen Victoria Street, E.C., the quantity surveyor. The estimated cost is £30,000.

BITUMEN.*

ITS APPLICATION IN ARCHITECTURE AND ENGINEERING.

By ALLAN GREENWELL, F.G.S., A.M.I.C.E., M.S.I., Editor of the "Colliery Guardian," &c.

SEEING that bitumen in one form or another occupies such a prominent place in both architectural and engineering construction, it is somewhat surprising that more attention has not been given to the subject by professional men.

A clear understanding as to what bitumen is is somewhat rare, as at times one hears the ordinary coal-tar pitch asphalt spoken of as bitumen; it is therefore desirable that at the very outset we should avoid any confusion in the use of terms. So far as the term "bitumen" is used throughout this paper it will mean the natural hydro carbon bitumen or asphaltum procured from one or other of the well-known natural sources, and will not include any artificial by-product from coal.

Whilst to-day apparently bitumen is being brought to the fore as a material for damp-resisting and waterproofing, it must by no means be supposed that it is new in its application in these directions, for it is true, in this instance at least, "there is nothing new under the sun."

If we go back and examine the sacred pages, we find that the Ark was lined with bitumen in order to make it proof against the action of the water. Again, the life of the great law-giver Moses was preserved in a rush basket rendered impervious by means of asphaltum. It is also very certain that the valuable properties of bitumen were well known to the ancient Assyrians and Egyptians, as from recent discoveries it is certain that it was largely used by them as a cementing and preservative material.

According to Xenophon, the Median wall was built of burnt brick laid in bitumen, which was no doubt obtained from the renowned Fountain of Is, on a tributary of the Euphrates, as this source still yields bitumen. Further, we have it on the authority of Diodorus Siculus that the walls of Ancient Nineveh were built of bricks laid in bitumen, for he says, "In order to bind the bricks, they were covered with a layer of bitumen instead of simply tempered clay, and were arranged in courses, between each thirteenth course of which a bed of reed canes was introduced," these latter no doubt for bonding purposes.

That the Egyptians made extensive use of bitumen for preserving their dead is evidenced to-day by the many examples of its preservative properties, which can be seen in our museums, where so many of their illustrious dead have been transferred. The method evidently adopted by the Egyptians in the preservation of their dead was to first embalm the body, preservative materials being put in for this purpose (most of these are known, but there are some which still remain a mystery in spite of careful analysis). After this had been done a layer of bitumen about $\frac{1}{8}$in. thick was put on hot, tightly wrapped with canvas, then another layer of bitumen as before, more canvas, and so on until the process was considered complete. A specimen in a remarkably fine stage of preservation now rests in the British Museum; it represents a man in a forced recumbent posture, and probably dates from the Neolithic period.

Again we find that bitumen must have been largely used in the construction of many ancient monuments, as, for instance, in the tombs of Luxor, which was practically the site of Ancient Thebes. The perfect state of preservation of the tombs is due to the fact that bitumen was used as a waterproofing and preservative material, being run in apparently hot between the brickwork. It was in fact used by the Egyptians in all manner of buildings and in the construction of cisterns, silos and other works where waterproofing was necessary.

The use of bitumen seems to have been neglected, and to a very large extent forgotten, until in the year 1712 it was again brought into prominence by a Greek physician, Eyrini d'Eyrinus. The asphalt beds of the Val de Travers were first discovered and utilised by him, and he recommended the material as being "peculiarly suitable for covering of all kinds of constructions; to protect wood and stonework against decay, worms and the ravages of time, rendering them almost indestructible where exposed to wind, wet and extreme variations of temperature."

Eyrinus was aware that bituminous mortar had been used in the building of Ancient Babylon, and he himself succeeded in using it with great effect for the lining of cisterns and walls, as a cementing material, and for the flooring of warehouses, &c., but again after some time the material fell into disuse, the quarries of Val de Travers were even forgotten, and it was not until the year 1832 that the material was prominently and successfully reintroduced. The credit on this occasion is given to Count Sassenay, and in the year 1838 under his direction asphaltic stone (which is a limestone impregnated with bitumen to the extent of 7 or 8 to about 20 per cent) came to be pretty extensively used in France for pavements and roadways and for protecting floors and walls from the effects of damp. From France the application of the material for such purposes extended to other countries, and to-day there is a widespread demand for asphaltic pavements and roadways.

Having thus far traced the history of the material in its application from the earliest times down to the present day, the question which naturally arises in the mind is how it originated and what it really is.

Bitumen, according to Boussingault, on analysis is found to be made up as follows:—

Carbon - - - -	85 parts
Hydrogen - - -	12 ,,
Oxygen - - - -	3 ,,
	100 ,,

Composition of Trinidad Pitch.

Volatile organic matter -	76·75
Non-volatile organic matter	17·77
Ash - - - - - -	5·48

Chemical composition of Bitumen of Judea.

Carbon - - - - -	77·84
Hydrogen - - - - -	8·93
Oxygen - - - - -	11.54
Nitrogen - - - - -	1·70
Sulphur - - - - -	3·00

Bitumen.

Properties.—Variable according to purity. Specific gravity = 1·092.

Solubility.—Partially soluble in alcohol. More completely soluble in carbon bisulphide, petroleum spirit, chloroform, oil of turpentine, coal-tar, benzol, naphtha.

Action of Heat.—It softens at 58° to 60° C.; melts at 100° C. When distilled with water a volatile oil, called by Boussingault "petrolene," is given off. This is probably a mixture of paraffins.

The residue, called "asphaltine," resembles the original substance, but does not soften below 300° C., and decomposes below its melting-point. *Origin of Bitumen.*—Somewhat obscure, but probably the result of oxidation of the unsaturated hydrocarbons in petroleum. There are two main theories, viz.: (1) That bitumen has been formed by inorganic means, as a product of chemical action. This view is held by Mendeleeff. (2) That it is a distillate from animal or vegetable remains. Coal-tar pitch is the residue of coal tar after the separation of naphthas, phenols, creosote and anthracene oils. It amounts to about two-thirds the original weight of the coal tar before distillation. Its character varies with (1) temperature of distillation; (2) quality of coal distilled.

Chemical Composition of Coal-Tar Pitch.

Carbon - - - -	75·32
Hydrogen - - - -	8·19
Oxygen - - - -	16·06
Ash - - - - -	0·43

Sulphur and Nitrogen variable traces.

Coal-tar pitch may be either soft, hard or medium, according to quality of coal. The hardness depends greatly on the perfection to which distillation has been carried, and it is generally necessary to thin it down before use by addition of various tar oils. Only the heavy oils should be used, or the pitch will lose much of its binding or cementing power. It is obvious, therefore, that artificial pitch is not to be relied upon to the same extent as the natural product. Bitumen is thus an oxygenated hydrocarbon. It is found in diversities of strata, which may be classed in three principal divisions.

(1) In which the containing and adjacent rocks are of igneous origin—as in the case of Cuba, where Mr. Taylor, who made a careful examination of this district, remarks: "It seems very probable that all the bituminous matters, whether known under the names of chapapote, asphalt, mineral pitch, petroleum, mastic bitumen, liquid or fixed bitumen, and other terms, are simple varieties of the same mineral substance, which appear at the surface of the points of fracture in the disturbed and metamorphic regions—in other words, in the centres of dislocation of the beds." The latter part of this sentence seems to indicate that the associated rocks are sedimentary, but in other parts of the same article they are stated to be "serpentine," "euphodite," "diorite," evidently of the true igneous type.

(2) In which the containing rocks are stratified and of the primary or secondary epochs. The mode of occurrence is usually that of disseminations in the granular form throughout the entire stratum, or that of springs of petroleum, naphtha, &c., issuing from the soil, or exuding from the fissures of the beds. The bituminous limestones of France are instances of this case.

(3) Where the deposits are in formations of the tertiary age, and usually accompanied by lignite or brown coal. These are the most abundant sources of asphaltic substances, and include those of Peru, Trinidad, and of several other localities, but the descriptions are often too vague to ascertain positively to what geological group the deposits must be referred. As the Trinidad bitumens belong to this division, the theory of their origin which is here suggested is probably that by which most of the bitumens of the third series have been produced, but in the case of the first two divisions other causes may have affected the generation where the circumstances are very different.

Although commercially bitumen or bituminous asphalt is limited for its supply to only a few districts, it is nevertheless not by any means of local or limited occurrence, and this again evidently indicates that its existence is due to extensively operating natural causes, and not to any accidental combination of special agencies.

In Venezuela there are deposits of mineral pitch in the provinces of Merida and Cova and Maracaybo. Springs of petroleum are abundant in Trugillo and Cumana (Gulf of Cariaco). The soil in the vicinity of Maturin and Guarapiche is stated to be impregnated with bitumen; and with regard to the existence of the substance in the Antilles Mr. Cowling Taylor says, "The entire chain of the West India and Windward Islands present similar phenomena of petroleum spring beds or veins of asphaltum, and accumulations of mineral pitch, and traces of metamorphic and volcanic rocks in great abundance"; and he mentions especially Barbados, where compact bitumen or asphalt abounds and the calcareous rocks are frequently impregnated with bitumen.

---

* A paper read before the Northern Architectural Association on February 4th, 1903.

In Cuba asphalt or chapapote is very extensively diffused. It is often termed bituminous coal, but is really on analysis found to be bitumen, consisting as it does of carbon, 34·97; volatile matter, 63·00; and ashes or cinder, 2·03.

In New Grenada bitumen prevails along the margin of the Magdalena valley.

In Peru asphaltum of typical purity occurs. The Incas used bitumen in the same manner as the Egyptians.

In the interior of Mexico are lakes of fresh water where the chapapote is found bubbling up to the surface. It has a pungent smell like that of liquid asphaltum and possesses some of its qualities.

In Texas a lake exists within a hundred miles of Houston closely resembling the pitch lake of Trinidad. It is filled with bitumen or asphaltum, and is about a quarter of a mile in circumference.

In France, at Laubsann, near Strasburg, lignite bituminous sandstone and bituminous limestone are found. Also in Seyssel (Department of Ain), Limmer, Auvergne, Puy de la Bouriere, Puy de la Sede, and in Sicily.

In Portugal a mine of asphalt of good quality has been discovered in the neighbourhood of Alcobaça.

In Syria asphalt or bitumen is in great abundance on the shores of the Dead Sea. It is black in colour and in fracture closely resembles ordinary pitch. In other essentials it seems to resemble the chapopote of Cuba. There is also a deposit of bitumen in Mount Lebanon, in rocks probably of volcanic origin.

In the provinces of Shirran and Daughestan in the Caucasus there is a great abundance of naphtha, especially on the promontory of Baku, and an extension of this formation exists in the peninsula of Kertch in the Crimea, and there is also a bituminous formation on the peninsula of Taman. Bitumen and petroleum are also very abundant in Arabia in strata wholly composed of oceanic animal matter, and sometimes exuding from fissures and abrupt declivities caused by the intense heat of the climate.

In all the countries bordering on the Tigris and Lower Euphrates, and also at Koordistan in Persia, bitumen, petroleum and naphtha are found, and in the Birman Empire and China it is also said to be found, although the details are not ascertained.

The bitumen of commerce may be conveniently divided under two heads, one of which we shall term asphalt, which is really a bituminised limestone containing from 7 to 20 per cent. of bitumen, and bitumen which is wholly free from foreign substances.

Of the first of these the qualities which are best known and being used to any extent in Europe are Val de Travers, Seyssel, Sicily, Chieti (in the Abruzzia), Auvergne, Laubsann and Limmer, and all these are known to be actual natural rock asphalts.

In America comparatively little has been done with these materials, as most of the so-called asphaltum pavements there are made of Trinidan bitumen artificially mixed in certain proportions with sand or limestone; some of these pavements have been very successful.

The method of obtaining this bituminous limestone or rock asphalt is by mining, and the seams are of varying thicknesses from very narrow streaks to 6ft. and 10ft. deep. It is found between two layers of white hard limestone either totally unimpregnated with bitumen or else with mere traces of it, which have the appearance of thin smoke or the faint stains in white marble. Sometimes, however, layers of sand and marl are found which have to be propped or held up by rubble. The workings of the Fonticelle Mine in Italy, the property of the Neuchatel Asphalt Co., Ltd., are subterranean; from this mine comes the famous Val de Travers brand of asphalt.

At the company's works the rock is treated so as to be formed into compressed asphalt or comprime and mastic, the two forms in which it is used for the formation of roadways and pavements. For the purposes of the manufacture of the compressed asphalt the rock is received from the mines in blocks of irregular shape, which are first subjected to a crushing process in a steam crusher and broken to the size of walnuts. The material is then passed on to a machine called a disintegrator, which reduces it to powder. The powder issuing from the disintegrator is received on an inclined screen which allows the fine powder to drop through, while any grains too large for the meshes are carried over and conveyed back to the disintegrator to be re-ground. The powder thus obtained is deposited in a covered shed; when required for use it is heated in slowly-rotating cylinders (very much like a large coffee roaster) over a fire of wood or coal until it reaches the right temperature for laying; this process takes two or three hours. The object for heating is twofold: (1) to evaporate moisture, (2) to bring the bitumen into such a condition that it may exert the maximum of binding power when subjected to compression by the rammers. If any portion is overheated the bitumen is fused; if underheated, the asphalt will not be thoroughly consolidated; hence the utmost care is needed in regulating the temperature, which varies for different kinds of asphalt, since some asphalts will bear a greater heat than others without deteriorating The extreme limits are, say, 250 to 300 degs. Fahr.

The mastic which is supplied in blocks, known as Val de Travers or other mastic, is manufactured by pulverizing the natural rock in exactly the same manner as for the compressed asphalt; it is then heated in boilers, and from 5 to 10 per cent. of refined bitumen is added, and the whole mass reduced to a mastic or thick liquid state. This is run into moulds, and when cool again consolidates into a hard elastic block, which is used in varying proportions with grit and refined bitumen for laying pavements.

In the laying of roadways with the comprime the method adopted is as follows:—The roadway is formed with a bed of good Portland-cement concrete, and evenly finished off to the precise contour of the roadway required. When this concrete has become thoroughly set, and become hard and dry, the powder, which has been previously cooked, is brought to the site whilst hot; and as asphalt in bulk retains the heat undiminished for several hours it can be easily conveyed in properly constructed carts from the cookers to the site, where it is spread and raked over to a uniform thickness, usually two-fifths to three-fifths more than the depth of asphalt prescribed for the finished road. The compression of the powder thus spread is effected by men with iron rammers, which have been previously heated in a fire to about the same temperature as the asphalt powder. After this has been accomplished and the mass reduced down to the finished thickness, the final smoothing is done by an iron instrument of curved form heated to an extent sufficient to soften the bitumen at the surface of the asphalt, and thus gives a fine finish and a glassy appearance to the whole. The work is then complete, and as soon as it is cooled to the temperature of the atmosphere the road can be thrown open to traffic. It can easily be seen that the whole operation of laying is one that calls for much special skill and practical dexterity for its efficient performance. Roadways thus formed are very good, being nearly noiseless, cleanly, impermeable to moisture, diminish to the utmost the force required for traction, and are durable.

In the laying of the mastic quite a different process is required. The mastic cakes, which are hexagonal, are manufactured at the works at Travers, and sent in this form to the site to be covered. These blocks are broken into pieces as big as a man's fist, ready to be thrown when required into the heating apparatus in which the mastic is cooked. This apparatus, commonly called a street pot, consists of two parts. There is first the mantle, a round envelope of sheet-iron furnished with a chimney and a small door opposite it for firing, the upper and lower rims being strengthened with iron bands; and this frame forms the furnace in which the fire is kindled. The second part is the kettle proper, a round pot of strong iron with a steel bottom, destined to receive the mastic; this pot hangs on the upper rim of the mantle by the flange, descending into the furnace for a little more than half its depth, but high enough to allow the flames of the fire to play all round it. The best fuel for heating the whole surface of the pot, thus giving uniformity to the melting, is peat or hardwood. Sometimes coke is used, but it should be avoided if possible, as it is apt to burn the bottom of the pot and thus tends also to burn the bottom mastic.

Before lighting the fire a small piece of bitumen (half the required proportion) should be placed in the bottom of the pot, and, as soon as the fire has been lighted, the broken pieces of mastic placed on the top of it until the pot is a little more than half full; the cover should then be put over the top and the mastic allowed to stand for twenty minutes to half an hour, the fire being well kept up. During this time the materials should be watched, and as soon as the mastic commences to melt the cover should be removed and the mass stirred with a long stirrer.

This stirring process finished, the remainder of the mastic should be put in, followed by half the remainder of the bitumen, filling the kettle to the top; again the cover should be put on and a steady fire kept up. When the mastic round the edges gives signs of melting it should be stirred constantly; when the whole mass has become pasty and soft, half the required proportion of fine sharp grit should be added with the remainder of the bitumen, spreading the grit evenly over the top.

The proportion of materials generally used in cooking the mastic are as follows:—

Twelve blocks of mastic, say	640 lbs.
Refined bitumen - -	39 „
Sharp grit (free from loam) -	335 „

The proportion of grit should of course be varied according to the aspect of the street where the mastic has to be laid. Where it is exposed to the heat of the sun for any considerable portion of the day more grit and less bitumen should be used in mixing. It is an indication that the material is cooked when jets of blue-coloured smoke ascend from the surface; another and most frequent test is that of thrusting a stick into the mass, and if it comes out clean and the mastic does not adhere to it, the material may be considered cooked. This cooking process takes from four to six hours.

The material being ready for spreading, the mastic is taken out of the pot and put into a wooden pail, which is passed to the man who is termed the spreader, and he empties the contents with a sweeping motion across the path. He then spreads the material with a wooden float to the required thickness. It is essential in putting down this material that the second pailful should overlap the first whilst hot, and so on with each successive layer. If the surface on which the mastic is laid is at all damp blisters will form in the mastic, and it is the business of the man who follows the spreader to prick them with a sharp piece of wood and rub the holes made until the blisters disappear. Sometimes he will also come across a burnt piece of mastic (caused by imperfect or insufficient stirring); this must be thrown out at once and hot mastic rubbed into the hole.

It will be again noted that in this mastic a great deal depends upon the method of preparation and laying and the quality of the bitumen used, as any omission of care and skill will render the asphalt when laid inferior and not able to fulfil its purpose.

The manufacture and use of the foregoing kinds of natural rock asphalt are almost limited to Europe, as in America the principal street-paving is done with an artificial rock asphalt composed of Trinidad bitumen and sand and other aggregate in the following proportions:—

Bitumen - - - - -	12·38
Organic matter - - - -	·65
Mineral matter, sand and other aggregate - - - -	86·97
	100·00

The principal contractors are the Barber Asphalt Co., and more than 40 million sq. yds. of it have been laid in the United States with satisfactory results. It is further claimed by the American manufacturers that it is better than the natural rock, as the addition of the sand makes it as a road pavement less slippery than the natural rock asphalt. The bitumen thus used is obtained from the famous Pitch Lake at Trinidad. A description of this lake is given in Charles Kingsley's book "At Last," where, having landed at the La Brea point, he says: "As we went onward up the gentle slope (the rise is 138ft. in rather more than a mile), the ground became more and more full of pitch and the vegetation poorer and more rushy, till it resembled on the whole that of an English fen. The plateau of pitch now widened out, and the whole ground looked like an asphalt pavement, half overgrown with marsh loving weeds, whose roots feed in the sloppy water which overlies the pitch. But as yet there was no sign of the lake. The incline, though gentle, shuts off the view of what is beyond. This last lip of the lake has surely overflowed and is overflowing still, though very slowly. Its furrows all curve downward, and it is, in fact, as one of our party said, 'a black glacier.' The pitch, expanding under the burning sun of day, must needs expand most towards the line of least resistance, that is, downhill; and when it contracts again under the coolness of night, it contracts, surely from the same cause, more downhill than it does uphill; and so each separate particle never returns to the same spot whence it started, but rather drags the particles above it downward towards itself. At least so it seemed to us, and may be likened to a caterpillar, or rather caterpillars innumerable, progressing by expanding and contracting their rings, having strength enough to crawl downhill, but not strength enough to crawl back uphill again.

"At last we surmounted the last rise, and before us lay the famous lake—not at the bottom of a depression as we expected, but at the top of a rise, whence the ground slopes away from it on two sides and rises from it very slightly on the two others. The black pool glared and glittered in the sun. A group of islands, some 20yds. wide, were scattered about the middle of it. Beyond it rose a noble forest of Moriche fan palms; and to the right of them high woods with giant mombins and undergrowth of cocorite—a paradise on the other side of the Stygian pool.

"We walked, with some misgivings, on to the asphalt, and found it perfectly hard In a few yards we were stopped by a channel of clear water, with tiny fish and water beetles in it; and looking round, saw that the whole lake was intersected with channels, so unlike anything which can be seen elsewhere that it is not easy to describe them.

"Conceive a crowd of mushrooms, of all shapes, from 10ft. to 50ft. across, close together, side by side, their tops being kept at exactly the same level, their rounded rims being squeezed tight against each other; then conceive water poured on them so as to fill the parting seams, and in the wet season, during which we visited it, to overflow the tops somewhat. Thus would each mushroom represent tolerably well one of the innumerable flat asphalt bosses, which seem to have sprung up each with a separate centre, while the parting seams would be of much the same shape as the asphalt, broad and shallow at top, and rolling downward in a smooth curve till they are at bottom mere cracks from 2ft. to 10ft. deep. The oil, they say, which the asphalt contains when it first rises, evaporates in the sun, of course most on the outside of the heap, leaving a tough coat of asphalt which has generally no power to unite with the corresponding coat of the next mass.

"We pushed on across the lake over the planks which the negroes laid down from island to island. Some meanwhile preferred a steeplechase with water jumps. So, whether by bridging, leaping or wading, we arrived at last at the little islands, and found them covered with a thick low scrub. Passing these little islands, which one said (I know not how truly) changed their places and number, we came to the very fountains of Styx, to that part of the lake where the asphalt is still oozing up. As the wind set towards us, we soon became aware of an evil smell — petroleum and sulphuretted hydrogen at once—which gave some of us a headache. The pitch here is yellow and white with sulphur foam, so are the water channels, and out of both water and pitch innumerable bubbles of gas arise loathsome to the smell. We became aware also that the pitch under our feet was soft. What we did see is that the fresh pitch oozes out at the lines of least resistance, namely, in the channels between the older and more hardened masses usually at the upper ends of them, so that one may stand on pitch comparatively hard and put one's hand into pitch liquid, which is flowing softly out, like some ugly fungoid growth, into the water. One such pitch fungus had grown several yards in length in the three weeks between our first and second visit.

"In one of the star-shaped pools of water, some 5ft. deep, a column of pitch had been forced perpendicularly up from the bottom. On reaching the surface of the water it had formed a sort of centre table 4ft. in diameter, but without touching the sides of the pool. The stem was about a foot in diameter. I leaped out on this table and found that it not only retained my weight but that the elasticity of the stem enabled me to rock it from side to side. Pieces torn off the edges of this table sank rapidly, showing that it had been raised by pressure and not by its buoyancy. Strange, though true; but stranger still did it seem to us when we did at last what the negoes asked us, and dipped our hands into the liquid pitch to find that it did not soil the fingers. The old proverb, that one cannot touch pitch without being defiled, happily does not stand true here, or the place would be intolerably loathsome.

"In five minutes we had seen, handled and smelt enough to satisfy us with this very odd and very nasty vagary of tropic nature; and as we did not want to become faint and ill, between the sulphuretted hydrogen and the blaze of the sun reflected off the hot black pitch, we hurried on over the water furrows and through the sedge beds to the further shore, to find ourselves in a single step out of an inferno into a paradise."

At the bitumen factory at Trinidad, what is called epuree is made, this being merely the raw bitumen partly refined, so that it may be more conveniently shipped.

The whole of the lake is the property of the British Government, and was at one time leased out to various small firms, who had a right of digging out the bitumen, paying to the Government a royalty of so much per ton. But some time ago all these leases passed into the hands of American capitalists, who made arrangements with several firms in Europe and America to supply them with whatever bitumen they required and, further, to avoid undue competition, arrangements were entered into whereby the bitumen for different uses was put into the hands of different firms. This lake of pitch proper is about 100 acres in extent, and is believed to be almost inexhaustible, and the asphalt taken from it is applied to various purposes; a large portion of it is used for laying pavements, for damp-coursing, cellar or basement flooring, flat-roofing, bridge-building, both for waterproofing and traffic, and to stop vibration in engine foundations, culverts, tunnels and subways. Electricians find it the best and most effective insulator known. It is elastic, and used in various circumstances where rigid cements fail, and wherever allowance has to be made for expansion and contraction. It is also employed in the manufacture of marine glue, and in its most highly refined state is made into wafers for fastening the tips on billiard cues. The quantity of bitumen obtained from this source last year was over 100,000 tons, and still there does not appear to be any substantial diminution in the lake.

The great value of bituminous asphalt lies in its elasticity, and instances are many where serious vibrations caused by the working of heavy machinery have been altogether stopped by putting in foundations of bituminous concrete instead of the ordinary rigid Portland-cement concrete. About the year 1880 an English gentleman, who was connected with the asphalt industry, endeavoured to manufacture a material to be used for the purpose of stopping vibration, preventing the action of dampness and for waterproofing purposes. It was found that although the ordinary mastic had a certain amount of elasticity due to the presence of the bitumen, where it was used as a damp-course in walls where subsequent settlement took place the asphalt also was broken owing to its brittleness when set. He therefore reverted to the use of the refined bitumen run on to bagging, and this material is now known as pure bitumen damp-course. A modification of this material is less than ¼in. thick, and is composed of pure Trinidad bitumen. The advantages claimed for it are that the maximum of elasticity and of

COWPER'S HOUSE AT OLNEY. DRAWN BY HERBERT NORMAN.

damp-resisting properties is obtained, and that therefore as a damp-course it will not crack on any settlement of the building taking place; and moreover as the material is prepared before leaving the works, the possibility of it being non-effectual owing to dampness existing in the work on which it is to be laid is obviated.

You will remember the amount of care which is necessary in the preparation of bitumen mastic placed *in situ*, and how everything depends on there being no dampness on the site to be covered and no overcooked or undercooked mastic being put in; it is therefore perfectly obvious that the claims of the sheeting over asphalt laid hot or run into walls is thoroughly maintained. I understand that this material has to-day a world-wide reputation, and has been extensively used by the most eminent engineers and architects in this country. Messrs. G. M. Callender & Co. are the sole manufacturers of bitumen in this form.

They also manufacture a somewhat stouter material known as pure bitumen sheeting. This is mostly used for lining ponds, tanks, reservoirs, culverts, sewers, covering bridges, arches, and for rendering basements watertight; and another of the advantages claimed for the bitumen in this form is the comparatively easy method of jointing the various sheets together.

The sheets are laid out flat upon the surface to be covered and the edges lapped about 2in. The layer, with a steel brush, first cleans off the paper and any chalk which may remain on the top edge of the under sheet and the bottom edge of the upper sheet. He then takes a hot iron and goes over these two edges in order to make the bitumen plastic; the two edges are then brought together and properly pressed; the top outside edge is then sealed and the joint is complete.

In securing the brick or concrete lining of a tank or inside walling to the wall behind, one-half of the tie is first built into the main wall; the sheeting is then laid on the face and the bolt driven through to the front; the other portion of the tie is then put on, and after being well caulked with liquid bitumen is screwed up tight; the inside brickwork or concrete is then built, and thus an efficient tie is maintained between the two portions of brickwork or concrete in the wall.

Mr. George Bransby Williams, A.M.I.C.E., read a paper on the subject before the Institution of Civil Engineers in 1898. Speaking of the water supply of the town of Whitby, he says:—

In the valley on the site of a small marshy lake known as Randymere, a storage reservoir, which has a capacity of 13,000,00 gals., and an area of about four acres, was constructed in 1884 by building two earthen embankments at a distance of 300yds. apart. As soon as the reservoir was completed and filled, a considerable leakage was discovered through the joints of the surrounding sandstone. It was impossible to determine its exact position, but it was evident that a large proportion of the water made its way through the narrow ridge separating the reservoir from the main valley, thus giving rise to springs in the low side. The total leakage when the reservoir was full amounted to 250,000 gals., and when half full to 110,000 gals. per day; an attempt to stop the leaks by sinking a puddle trench along the north-east side proved unsuccessful. In 1894 Mr. James Mansergh, past-president of the Institution of Civil Engineers, was called in to advise the company, and he recommended that the only method to make a thoroughly satisfactory repair of the reservoir was to line it throughout with watertight material. It was eventually determined to use pure bitumen sheeting, sandwiched between two layers of concrete. The concrete was laid 9in. thick over the whole of the bottom, but the thickness of the two layers varied. The top layer was 4in. thick on the sides and 3in. thick on the floor, the bottom layers being thus 5in. and 6in. thick respectively. The bituminous sheeting consisted of specially-woven canvas steeped in bitumen and passed through rollers so as to be about $\frac{1}{8}$in. thick. It was laid by the manufacturers' own men in lengths of 24ft. by 6ft. wide, the sheets being allowed to overlap 3in. at the joints. Red-hot irons were run along the upper edge of the lower sheet and the under edge of the overlapping sheet; the joint was then pressed down and the hot irons were run along the top. Finally the joint was sealed with melted bitumen, and the sheeting when laid in this way made a thoroughly strong watertight lining. The work was finished by the middle of September, 1898, and the final filling was commenced early in November. By the beginning of December the reservoir was full. It was then found to be perfectly watertight.

The general conclusions which may be gathered from the foregoing facts are—

Firstly: That bitumen is a mineral which was well-known to the ancients as a water-resisting material.

Secondly: That its great advantage lies in its elasticity and its power of adapting itself to any ordinary conditions of settlement.

Thirdly: That being a natural mineral it is not affected by atmospheric influences.

And fourthly: It is very obvious that the purer the bitumen used the more permanent and effective will be the work, and it therefore seems to me that for architectural and engineering purposes in resisting dampness and the passage of water the best form is that of sheeting.

Cowper's House at Olney (a sketch of which by Mr. Herbert Norman, of Northampton, is reproduced on this page) is now a national property and contains the relics of the poet, who died on April 25th, 1800.

The Embassy at Washington to be enlarged.—England has bought, as the site of the new Embassy, the Oaklawn Estate of nine acres, which was under consideration for a new White House before the renovation of the historic Executive Mansion was decided upon instead. France, Russia and China are also enlarging their Embassies upon a scale commensurate with their new dignity since their Ministers became Ambassadors, but none approach England's plans in stateliness.

Law Cases.

Underground Pipe from Two Houses a "Sewer."—The case of *Silles* v. *Fulham Borough Council* recently came before the Court of Appeal. It concerned two houses in Fulham built in one block, with a gutter running along under the eaves, which carried a portion of the rainwater from the roofs of both houses into a down-pipe, into which also flowed the slops and bath water of one of the houses. The down-pipe discharged into a gulley and thence into an underground pipe which communicated with a main sewer. The question was whether this pipe was a drain or a sewer.—The Court dismissed the appeal.—Lord Justice Vaughan Williams said the facts were substantially identical with those in the two cases of *Holland* v. *Lazarus* and *Geen* v. *Vestry of St. Mary, Newington*, in which it was held that where two drains carrying sewage matter, which ran into one another and served two buildings and not a block of houses drained by a combined operation sanctioned by the vestry, those two drains so running into one another came to be a sewer within the meaning of the definition of "sewer" in section 250 of the Metropolis Management Act, 1855. And it was further established that it made no difference if one of the two drains happened to be a drain which only carried rainwater; such a case came equally within the definition.

Light and Air.—At the Lambeth Police Court the Camberwell Borough Council, proceeding through Mr. C. H. Kerslake, one of their sanitary inspectors, recently summoned Mr. Robert Briant, the owner of a house in Harris Street, Camberwell. In form, the summons was to obtain an order to abate a nuisance, but in substance the point was whether the owner of a house built long prior to the passing of the Public Health (London) Act could be compelled to make a structural alteration in it to the extent of putting a skylight in the roof for the purpose of lighting and ventilating a staircase and landing alleged to be dark and unventilated. Mr. Hopkins, in delivering judgment, said the defendant's houses were tiny houses in a mean street; but they were in very good order and repair, and could not be considered a "nuisance" according to the Public Health Acts. He was also of opinion that the premises were not in such a state as to be injurious or dangerous to health. He therefore dismissed the summons, and allowed the defendant £5 5s. costs.

R.I.B.A.

FOUR MODERN HOSPITALS.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. Aston Webb, A.R.A. The secretary announced the decease of Messrs. E. Birchall (Fellow), F. Edwards (Fellow), Young Bolton (Associate), R. Philip Day (Associate) and Col. John Davis (Hon. Associate); and the election as Fellows of Mr. John Woolfall and Mr. Joseph Swarbrick, presidents respectively of the Liverpool Architectural Society and the Manchester Society of Architects.

Mr. Edwin T. Hall, F.R.I.B.A., then read a paper on "Four Modern Hospitals."

The hospitals were (1) the City of Leeds Fever Hospital at Seacroft; (2) the City of Leeds Smallpox Hospital at Killingbeck; (3) the Sanatorium at Frimley, in Surrey, for the Brompton Consumption Hospital; (4) the Camberwell Infirmary.

Before dealing with his examples, the lecturer made some general observations on each type of hospital. No hospital on a rural site should be more than two storeys in height. In all the best modern examples of hospitals the main wards are placed with their axes north and south, when this is practicable, with windows on both sides and at the ends. Thus every bed and every wall gets all the sunlight there is during some part of the day. Double wards—that is, wards with a central wall and rows of beds on each side of it—should always be avoided. For consumptive sanatoria, as distinct from hospitals, large wards are not adopted; the ideal is a single room for each patient, with a southerly aspect, in a building not more than two storeys in height. On a city site, where relatively high buildings are a necessity, three or more storeys are suitable; and lifts and thoroughly aërated staircases for access and for fire escape must be provided.

The City of Leeds Fever Hospital

at Seacroft, about three miles from the centre of the city, consists of forty-two separate buildings. Accommodation is normally provided for 452 patients, but in cases of emergency a much larger number can be received. Attached to the hospital is a quarantine station of many cottages, to which infected families are removed until danger is past.

The administrative buildings consist of (1) the offices, with residence for the matron, for the assistant medical officers, and for resident porters and others; (2) the nurses' home, containing 121 rooms; (3) the female servants' home, with eighty-four rooms; (4) dining-rooms for nurses and servants between the homes and the kitchen; (5) the hospital kitchen, steward's stores, dispensary, staff consultation rooms, sewing-room, &c.

Every part of the hospital is connected by glass-covered open ways, with subways beneath for steam, hot and cold water, and gas pipes, electric mains, &c. The hospital pavilions are grouped in pairs, with fuel store and nurses' lavatories common to both on the cross corridor. Beneath these staff offices is the heating chamber. Each pavilion is axially north and south, with windows on both sides and at the ends. It has an entrance hall with the duty-room opening from it. To right and left are large wards, each containing fourteen beds, and opening from these are single-bed wards, all overlooked from the duty-room or ward kitchen. Each large ward has a wide balcony at the extreme end, flanked and sheltered by the towers, containing bathrooms, lavatories, and water-closets, and near these is an external flight of steps leading to the ground. Beneath every pavilion is a paved open basement, about 5ft. or 6ft. high, forming an aërial disconnection of the wards from the earth. In this all pipes and cables are placed, so that repairs can be done without coming inside the building. The smoke flues are also swept from beneath. The ward floors are of polished teak laid direct on the concrete. The walls are of cement, painted and varnished to match the faïence chimney-pieces. The heating is by passing fresh air over hot-water radiators at a calculated low velocity, so as always to be changing the atmosphere of the room, and this is done completely three times an hour. The extraction is by fire and aspirating flues. Heating, the lecturer considered, should never be done by pipes laid in channels with gratings over. These become receptacles for dust and filth of all kinds. The ventilation of the hospital was secured by natural as opposed to artificial means, such as that usually called the Plenum system. In the lecturer's judgment, the latter was a mistake in any hospital. The windows, consisting of a pair of sashes and a fanlight with glass spandrel cheeks, extend to the ceiling. The isolation pavilions, of which there are four, consist of wards of one, two and four beds each, with nurses' rooms and special sanitary accessories for treating different diseases. In each of the diphtheria pavilions there is an operating room with side and top light. The block for severe operations contains an anæsthetic lobby, a theatre and a sterilising room. The staff quarters have everything necessary for comfort. The hospital kitchen is a room 50ft. long, with a large scullery attached. Close by is a large bakery, and there is a group of larders facing north and arranged with through currents of air. The steward's store is 60ft. 6in. by 25ft. 7in., with a gallery round. From this centre enclosed trolleys convey food and stores to all parts of the hospital. Describing the drainage and treatment of sewage, the lecturer drew attention to the sewage irrigation outfall, from which it is necessary to exclude typhoid germs, and showed drawings of an apparatus devised by himself for dealing with these germs. It consists of receiving tanks and boilers for alternate use. The typhoid sewage is received and boiled by steam, after which it passes to cooling beds, and thence to the outfall sewer.

Killingbeck Smallpox Hospital

is situated on the top of a hill with undulating country all around. The hospital buildings proper are grouped together on the summit of the site, the offices and medical quarters being in the centre, the laundry and mortuary to the west, the discharge block to the east, all outside the hospital road. Entering in the centre, the nurses' and female servants' homes respectively are to the west; the kitchen and stores, dispensary and serving-room to the south; the male servants' home to the east. Beyond to the north lie three large pavilions and two isolation blocks. The mortuary has no visiting-room for friends to view their dead, but it has, under a peristyle, a plate-glass sarcophagus, into which the body, suitably dressed, is placed from the mortuary on a rolling bed.

The Frimley Sanatorium

for the Brompton Consumption Hospital was next described. Here the author said he had tried to get away from the hospital, to suggest breeziness and health and the pleasant atmosphere of a large home. The institution consists of sixteen buildings. The patients' block is cross-shaped, with accommodation for eighty-eight patients in four two-storeyed radial pavilions, and for twelve in the centre, where special cases may be under closer surveillance. Every patients' room faces S., S.S.E. or S.S.W. His first design was for putting the eighty-eight patients in single rooms; but this was overruled. For the King's Sanatorium, however, his original plan was shown to his Majesty and to Sir Ernest Cassel, and the Committee came to the same conclusion as that he originally contemplated. As regards concentration, which in Germany was carried to an extreme, the lecturer said he had tried to find a mean. At Frimley they had 100 patients all within a radius of 195ft. from the doctor's consulting room and matron's sitting-room, and yet every room has an open outlook; all are away from noise and bustle, all have the greatest amount of sun, and all are sheltered. Another advantage of the plan was that ample classification could be got. They could have units of twenty-five males or females, with their separate group of closets, bathrooms and lavatories, or they could arrange convalescents by themselves or make other divisions of patients in units of eleven. There was but one dayroom on each floor. The great aim is to get the patients out into the open air for their recreation, not to encourage them to remain within. Provision is made by which beds can be wheeled out on to the terrace, and at each extremity of the pavilions there is a sunroom formed in a turret for patients in the end ward, in addition to a balcony. As regards roofs to terraces and balconies, the lecturer's idea of rolling-canvas shop-blinds had been adopted. These could be lowered or rolled up at will.

Camberwell Infirmary,

Brunswick Square, although technically a parish infirmary, is, owing to its position, really a general hospital, dealing with accident and acute cases of all kinds. The original building in Havil Street the lecturer was altering and modernizing to form part of the larger institution. It consists of twenty-one buildings, standing on a site of $4\frac{1}{2}$ acres, practically surrounded by roads, and all buildings are connected by glass-covered ways and subways. It accommodates 800 patients, has a resident staff of five doctors, while the other officials, nurses and servants number about 160. The new pavilions are axially north and south. The pavilion to the north — which may be taken as typical of all—consists of three main storeys and a fourth one over part of the area. It has at the home end a wide staircase, with walls of glazed brick from bottom to top. At the other end it has a secondary or escape staircase, extending from the flat roof to the road, in what is practically a separate tower. There are three exits from the building. On each floor there is a ward of twenty-four beds, with windows on three sides, and other wards of six, four and two beds respectively, affording opportunity for great classification. There is a ward kitchen. This and the corridors have also all their walls of glazed brick. There is only one fireplace in each ward for cheerfulness, the heating proper being by hot water. The large ward on the top floor has been specially designed for consumptive patients, and is a unique provision for a general hospital. Practically the whole of the enclosures on three sides consist of opening windows for open-air treatment, and above is a flat roof on which patients may spend all the day with something of interest to see in the panorama stretching across London. Three of the pavilions are so designed. One of the greatest modern improvements in hospitals is the superior accommodation now given to the staff. The female staff home at Camberwell Infirmary is situated in the central quadrangle, with a pleasant garden attached.

A discussion followed in which Messrs. Hugh Stannus, R. F. Chisholm, Thomas Blashill, Wilson, Angel, Hopkins, Hilton Nash, Osborne Smith and the president took part.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Buildings to Measure near Manchester.

ROCHDALE. — DRAUGHTSMAN writes: "(1) Are there any buildings within four or five miles of Manchester suitable to measure for the R.I.B.A. intermediate examination? (2) Do you think the drawings on plate 24 of Spiers's 'Orders' would be accepted for the sheet of Classic ornament?"

(1) The buildings in the neighbourhood of Manchester have been enumerated several times recently in the BUILDERS' JOURNAL. (2) It is quite permissible to copy the sheet of details referred to, but it is better to obtain a cast, say, of the Erechtheum frieze from Bruciani Brothers, Drury Lane, W.C., and, better still, to work direct from the marbles in the British Museum. G. A. T. M.

Size of Joists for Floors.

ILFORD.—FLOORS writes: "What should be the size of r.s.js. to use for a fire-resisting floor of 9ft. 9in. span between main girders, and the distance apart? The floor will be composed of coke-breeze concrete in the proportion of 7 to 1."

The kind of building should have been mentioned, or the use to which the floor is to be put, in order that some idea might be formed of the proper working load to allow for; also the span of the main girders should have been stated to determine the proper spacing of cross joists. A proportion of 7 to 1 for a coke-breeze concrete floor is not strong enough; 5 to 1 is much more suitable. Assuming the latter with a depth of 6in., and an external distributed load of 1½ cwt. per ft. super., the rolled joists might be 4¾ × 1¾ × 6½ lbs. per ft. run, which would carry 28 cwt. distributed. Then the span being 9ft. 9in., the distance apart will be $= \frac{28}{9{\cdot}75\,(1{\cdot}5 + 0{\cdot}5 \text{ wt. conc})} = 1{\cdot}436$, say 1ft. 6in., without allowing for the stiffening due to the concrete; but it is generally believed that with good materials the cross joists may be strained to double the amount when properly packed round with good cement concrete 50 per cent. deeper than the joist. This would make the width apart 3ft., but it may be checked by the special formula, allowing for extra strength due to concrete, $W = 32\,\frac{I}{L^2}$, where W = safe distributed load in tons, I = moment of inertia of section in inch-tons, L = span in feet. Then $W = 32\,\frac{6{\cdot}73}{9{\cdot}75^2} = 2{\cdot}27$ tons, but the gross load is 2 cwt. per ft. super., so that the distance apart would be $\frac{2{\cdot}27 \times 20}{9{\cdot}75 \times 2} = 2{\cdot}33$, say 2ft. 4in.; thus 2ft. 6in. apart would probably make a good safe floor. By increasing the depth of the cross joists the distance apart may be increased. For instance, if 6 × 2 × 12lb. rolled steel joists are used, they will carry 3 tons each without allowing for the reinforced strength due to concrete. The distance apart would then be $\frac{3 \times 20}{9{\cdot}75 \times 2} = 3{\cdot}077$, say 3ft., or by the above formula allowing for concrete, $W = 32\,\frac{I}{L^2} = 32\,\frac{16{\cdot}58}{9{\cdot}75^2} = 5{\cdot}6$ tons, and distance apart $= \frac{5{\cdot}6 \times 20}{9{\cdot}75 \times 2} = 5{\cdot}74$, say 5ft. 9in., or whatever shorter distance may be necessary to equalize the spacing to suit the span of main girders.

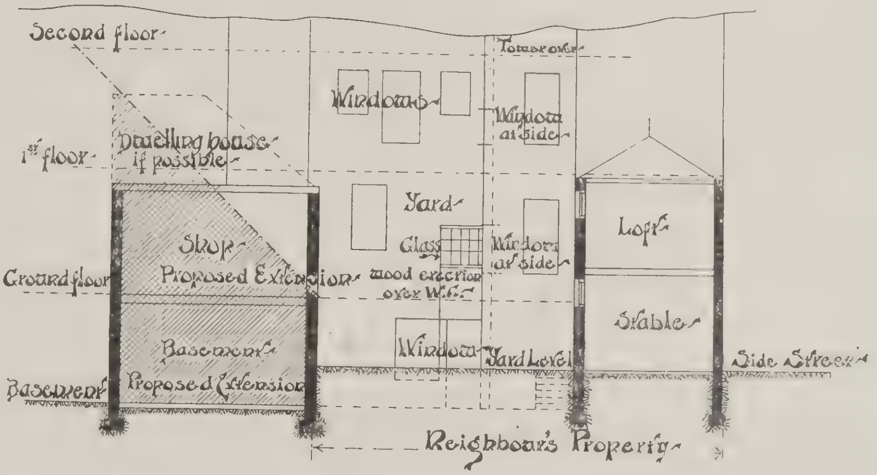
HENRY ADAMS.

Obstruction of Light.

LONDON, W.—YOUNG DRAUGHTSMAN writes: "My client proposes to build on his backyard and wants to extend his present basement and ground-floor shop (and, if possible, his house above) to the length of his stable wall. He has got the sanction of one of his neighbours and of the authorities, but his other neighbour threatens to bring an action against him if he builds, because, he alleges, his light would be obstructed. My client has been delayed for two years, and has consulted several architects, but they could give him no definite advice. The matter has finally been given to me. Can the building be proceeded with; or what provision would be necessary to give the neighbour his required legal light? Both the properties were built in 1868."

This question seems to be one of opinion and degree rather than of certainty. To build as proposed would certainly involve a slight decrease of light to the small back window of shop, the side window of tower, the window in room over shop, and the window in the small galvanized building in rear. The extent of the obstruction would, however, in no case be serious, unless the back window of shop be used for delicate work or colour-matching, so that if the building were commenced and an action brought only nominal damages would be obtained. To avoid all risk of a successful action being brought, the new building would have to be kept within the limits shown hatched on the accompanying section, and even then a solicitor should be consulted before the work is started. It is a pity that an arrangement cannot be come to in a case like this, as some risk of action must be run otherwise. Often a neighbour's objection is little more than a bluff to obtain blackmail.

G. A. T. M.



OBSTRUCTION OF LIGHT.

Building on Chalk.

BOURNEMOUTH.—W. F. writes: "I am thinking of building a house on the side of a chalk hill, overlooking and close to a rather deep railway cutting. The upper part of the chalk is largely composed of flints. Do you think there would be much vibration felt from the trains, or is the house likely to suffer? The site is rather steep. Would the flints be likely to settle?"

There will inevitably be some vibration in a house close to a railway cutting, but with certain precautions it is not likely to prove detrimental to the building, and the occupants soon become used to both the noise and vibration. The house should if possible be built so far back that an angle of 45 degs. from the nearest rail will not reach the house below the ground level, or, in other words, the horizontal distance between house and railway should be at least equal to the difference of level between the surface of the ground at the house and the rail level. This is for chalk; for other material a greater distance would be necessary. Occasionally cottages are built nearer, but it is not advisable. It would probably pay to remove the flints from the upper part of the chalk for use as road metal, or for constructing flint rubble walls, or spalled flint facing, as in many parts of Kent.

HENRY ADAMS.

Bending Moments in Beams.

CAMBERLEY.—PUPIL writes: "Let it be required to find the breaking weight of a girder 18ft. long, and loaded at two points, say, 6ft. from each end, d 14in., b 9in. and c 5in. Let W = one of the weights; then $R_1 = R_2$ these are the reactions $= \frac{W + W}{2} = W$; greatest B.M. $= R_1 \times \frac{L}{3} = \frac{W \times L}{3}$. Let W^1 = weight at centre to give the same bending moment; $W^1 = \frac{b \times d^2 \times c}{L}$; B.M. $= \frac{W^1}{2} \times \frac{L}{2} = \frac{b \times d^2 \times c}{2L} \times \frac{L}{2} = \frac{b \times d^2 \times c}{4}$. These bending moments must be equal, $\therefore \frac{W \times L}{3} = \frac{b \times d^2 \times c}{4}$, $W = \frac{3}{4} \times \frac{b \times d^2 \times c}{L} = \frac{3}{4} \times \frac{9 \times 14^2 \times 5}{18} = \frac{3 \times 49 \times 5}{2} = 367\frac{1}{2}$ cwts. at one point; total load = 735 cwts. The breaking weight of such a beam loaded at the centre would equal $\frac{9 \times 14^2 \times 5}{18} = 98 \times 5 = 490$ cwts., against 735 cwts. Does the greatest bending moment equal the breaking weight?"

The bending moment in a beam carrying two equal weights at equal distances from each end is uniform between the weights, and is equal to the reaction at either end multiplied by the distance to the nearest weight. If the beam is trisected by the two loads the bending moment will be $R_1 \times \frac{L}{3} = \frac{\frac{1}{2}WL}{3} = \frac{WL}{6}$ because the reaction is equal to one of the loads or half the total. The bending moment with a central load is $\frac{WL}{4}$; therefore, with the same total load, the stress on the material will be as ⅙ to ¼, or ⅔ to 1, or 1 to 1½, *i.e.*, the central load will stress the beam 1½ times as much as the same load divided into two parts and spaced so as to trisect the beam. The bending moment and the breaking weight are entirely separate and distinct things, and a systematic study of stresses and graphic statics should be made to enable the terms to be properly understood.

Views and Reviews.

Repairing Ancient Buildings.

This is a very important and timely book. Of recent years, we are thankful to say, a more conservative spirit has prevailed in the repair and restoration of old buildings, due largely to the efforts of this Society, but there are unfortunately still far too many restorations proposed each year. Restoration and renovation are words sometimes used to express merely repair, but they generally mean far more than this, and should be eliminated from the vocabulary of the clergy. It may safely be said that every building, however ancient, can be repaired and preserved for generations with all its original interest—a fact recognized by those possessing a thorough knowledge of construction and with experience of the repair of old objects, though unfortunately not often appreciated by the lay mind.

This book chiefly consists of a series of practical hints and recipes, and is very clearly written and ably put together. There is a short introduction, which discusses the ethics of restoration. If there is one general objection which can be raised against the book it is that it is compressed too much and seems rather dogmatic. The introduction hardly makes the objections to restoration strong enough or sufficiently explanatory to convince the average clergy when they are met with counter arguments.

The hints contained in the volume are especially valuable from the fact that they are founded on the practical experience of the Society. The following we heartily agree with: "There has of late years been an increasing perception among architects that the ordinary clerk of works is not the best possible director for work on ancient buildings. This feeling has resulted in some of the younger architects with a natural turn for construction undertaking the personal direction of works on the spot in conjunction with the Society; and it has proved a most satisfactory arrangement. . . . If, however, the work is carried out under the personal direction of the architect on the spot, the work is well done with the least possible loss of interest to the buildings, and at less cost than would be incurred if the ordinary methods of carrying out the restoration were adopted; for only the actual material, workmanship, and supervision would have to be paid for."

We reproduce here three illustrations from the book which show the admirable way in which the Society goes to work in preserving ancient buildings. Figs. 1 and 2 show how the Exeter Guildhall front was made secure. This work illustrates the importance of personal supervision in dealing with unexpected contingencies. It will be noticed that the beam bedded in the wall at the floor level, as shown in the section, originally gave support to the inner half of the wall, and as it was completely decayed there was danger of the wall breaking at this point, and indeed this movement was actually going on. The work which was carried out arrested the movement, and relieved the ancient front from unnecessary weight and thrust. Fig. 3 shows how cracks should be repaired. Where the new brickwork is shown, two cracks occurred through the thickness of the wall over the chancel

FIG. 1.

arch. The cracks were cut out and the flint wall on each side well bonded together with hard bricks. In order to relieve the arch of some of the weight of the superstructure a brick lintel was inserted through the length and thickness of the wall above the arch, which acts at the same time as a tie, and bonds the wall together.

A timely warning is uttered against the rebuilding of a wall simply because it is to some extent out of the perpendicular, as it may be quite safe. The method recommended of using plaster-of-Paris or cement bands across cracks to ascertain if movement is taking place is very good. While acknowledging the advantages lias lime mortar possesses over Portland cement in general work, we do not agree that it is best in foundation work, for a foundation is called upon to resist tensile stress fairly soon, and is subject to damp, and heavy showers of rain might also seriously weaken lime. We are surprised to find the laying of hay under tiles recommended—nothing is more reprehensible. Again, we should not advise the use of galvanized cast-iron pegs. We think it is going a little too far to say that "modern stained glass is always to be regretted."

"Notes on the Repair of Ancient Buildings." Issued by the Society for the Protection of Ancient Buildings. London: Published by the Committee and sold on their behalf by B. T. Batsford, 94, High Holborn, W.C. Price 1s. nett.

Keystones.

The great Screen Organ in York Minster, which has been rebuilt at a cost of nearly £5,000, was dedicated last week.

Exeter Cathedral.—The Society for the Protection of Ancient Buildings disapproves of the proposal to remove the glass in the west window of Exeter Cathedral.

Surrey Archæological Society.—The annual report state that during last year very satisfactory progress was made with the excavations on the site of Waverley Abbey, the most interesting discovery being the finding of a second guest-house, the buttress, bases and pillars being in excellent preservation. The total membership of the Society is at present 405.

New L.C.C. Fire Stations.—Two new fire stations at Clapham and Highbury have been erected by the Works Department of the London County Council from designs by Mr. W. E. Riley, the Council's superintending architect. The station at Clapham is at the junction of Grafton Square and the old town, and has cost £13,250. That at Highbury is in Blackstock Road, and has cost about £11,500.

"Kornhalls."—Thirty-six "Kornhalls," or magazines for storing grain, have been erected by the German Government throughout the country, at a cost of about £450,000. These buildings are fitted with the most modern machinery for cleaning and treating the grain, and it is stated that they are intended to render small farmers independent of the fluctuations of the market. Advances are made upon the grain stored, so that the farmers need not be in a hurry to sell.

Motherwell Competition.—Mr. Washington Brown, Edinburgh, the assessor appointed by Motherwell Town Council to adjudicate on the plans submitted for the proposed Carnegie Library, has placed Messrs. Creig, Fairbairn & M'Niven, York Place, Edinburgh, first. That firm has been selected as architects at the usual fees by the Town Council. Second place, and a prize of fifty guineas, has been secured by Mr. Thomas T. Paterson, 5, York Place, Edinburgh; and third place and 25 guineas by Messrs. J. N. Scott & A. Lorue Campbell, 44, Queen Street, Edinburgh. The building is to cost about £9,000.

FIG. 3.

A Memorial Tablet bearing the names of forty-three Marlburians who fell in the South African War has been placed in Marlborough College. It was designed by Mr. G. F. Bodley, R.A.

The late Prof. T. Roger Smith.—In an obituary notice the "American Architect" speaks of Prof. Roger Smith's "Acoustics of Public Buildings" as being "still, perhaps, the most practically useful work on the subject in print."

"The Trials of a Surveyor."—Referring to the paragraph on p. 83 of our issue for March 25th, the builder who assaulted the Llanfairfechan surveyor by pouring a bucket of water over him when inspecting a building has been fined 10s. and costs.

Flats in S.W. London.—Two blocks of residential flats, known as "Hurlingham Court Mansions," are now nearly completed. A roof garden will give the tenants an uninterrupted view over the Hurlingham Polo Club and surrounding scenery. The contractor for the new buildings is Mr. William Watson, of Ascot. Messrs. Fry & Son, Messrs. Gosslet & Co., and the Falkirk Iron Company have supplied the ironwork, and the Lift and Hoist Company the lifts. Messrs. Palgrave & Co., of Westminster, are the architects.

Architecture on the Stage.—Sir Henry Irving's "Dante," to be produced at Drury Lane Theatre on April 30th, will comprise the following eight scenes:—A street in Pisa, overlooking the Arno; Exterior of the Church of San Miniato, overlooking Florence; Interior of the Castle of the Malatestas in Rimini; A castle on Marshes at Maremma; The chapel of the Convent of Santa Clara; The graveyard of San Miniato; The Inferno; The Palace of the Popes at Avignon. This scenery has been painted in Paris by MM. Ronsin, Amable and Carpezat under the personal supervision of M. Sardou.

A large bronze has just been erected upon the north side of the parish church of St. Mary at Upottery. It has been made and erected by Messrs. Harry Hems & Sons, of Exeter.

A Memorial at Weston-super Mare has been erected in the parish church to the local soldiers who fell in the South African War. It is in alabaster, and has been carried out by Messrs. Harry Hems & Sons, of Exeter.

New Baptist Schools at Lowestoft have been erected in Grove Road. The building is faced externally with red bricks. The dressings are of white Costessey work. The contract amounted to £1,338, and has been carried out by Mr. C. E. Earl, of Lowestoft. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

A Reredos has just been erected in the Church of St. Michael and All Angels, Howe Bridge, from designs of Messrs. Austin & Paley, the architects of the church. The reredos is of Italian marble, the upper part of the panels being filled with mosaics executed in Venice from designs of Messrs. Shrigley & Hunt. On each side of the reredos arcading in red Devonshire marble extends to the north and south walls of the chancel.

New Bank Premises at Plymouth have been erected for the National Provincial Bank of England, from plans by Mr. Paul Waterhouse, M.A., F.R.I.B.A. Messrs. Lethbridge & Son, of Plymouth, were the contractors. The fibrous plaster ceilings are by Messrs. Jackson, of London; the fittings by Messrs. Worsley, of London; the desk grill and electric standards by Messrs. Hart, Son & Peard, of London; the ornamental tiling by Messrs. Whiting, of Leeds; the stained-glass windows by Messrs. Fouracre & Son, of Stonehouse; and the hydraulic lift by Messrs. Waygood & Otis.

Bricks and Mortar.

Aphorism for the Week.

A work of art will bear all kinds of interpretations; each in turn finds a basis in it, while the work itself, because it represents an idea, and therefore partakes of the richness and complexity which belong to ideas, suffices for all and survives all.—AMIEL.

Our Plates. THE design for a Gothic staircase by Mr. J. Craster Blechynder was submitted in competition to the Edinburgh Architectural Association, and received a prize. The staircase is of Early English style, to be built in stone with lead roof and bronze vane. The vaulting is designed to be constructed of concrete, with stone ribs and bosses.—The church at Clumber, near Worksop, was built in 1886 for the Duke of Newcastle. It is small, of simple traditional plan and very solidly constructed. It has a central tower with spire. The church rises from the even lawn, which slopes southward to a beautiful little lake, against a charming woodland background. It is faced externally with the white stone of a former and demolished building, while the upper portion of the tower, the spire, the buttress faces, copings, tracery and dressed work of doors and windows are of a warm red stone. Internally, its high nave and chancel are roofed with groined stone vaulting, and the red stone is carried through the masonry.

The L.C.C. and Architects. MR. H. H. COLLINS, of 61, Old Broad Street, the district surveyor for the Eastern division of the City, says, after something like forty years' experience of the Metropolitan Board of Works and the London County Council, that, while the officials are very courteous, they are not always amenable to reason. The expense and trouble which are caused by the County Council are well known to the architect, though surveyors may not be so well acquainted with this. An architect submits a set of drawings, and if he makes a difference of one-eighth of an inch in them he is asked to submit another and another set, the resulting expense, trouble and irritation being very great. There is no finality, and one never knows when one has finished with the Council. Architects would be content if the Council would say what they wanted and then rest content with a full compliance with the requirements.

The Decoration of Westminster Cathedral. THE interior decoration of the new Westminster Cathedral has been begun in earnest. The decorations of the side chapels are at present receiving attention, and it is computed that in about three months' time the mosaic work of the chapel of the Holy Souls will be finished, whilst similar work in the chapel of SS. Gregory and Augustine (the funds for which have been given by Lord Brampton) is proceeding apace. Mr. George Bridge, the well-known mosaic artist, has been entrusted with the work, and he is employing a staff of English lady-artists specially trained in this class of work. About twenty-five are at present busy all day in the cathedral, where, perched on scaffolding erected round the chapel roofs, they do their work by the aid of candle-light. The mosaic pictures in the Holy Souls' Chapel will depict saints in Purgatory, whilst the cartoons in the chapel of SS. Gregory and Augustine will represent events in the lives of those two saints. The next chapel on which operations are to be commenced is the chapel of the Blessed Sacrament, the marble work in which is now being finished. The new pulpit, by Medici, of Rome, has just been placed on the nave floor; it is of white statuary marble, beautifully inlaid with mosaic work.

Ideals. THE Glasgow Architectural Association held a meeting recently —Mr. W. J. Blain, vice-president, in the chair —when Mr. Fra. H. Newbery, headmaster of the School of Art, lectured on "Ideals." At the outset Mr. Newbery declared himself an idealist, arguing that what to-day might be ideal and unpractical became possible to-morrow. He deprecated the too close following of tradition, particularly book-work, believing that, just as the Greek, the Roman and the Mediæval architects worked unconsciously of "style," giving but material form to the manifold influences around them, so our own times, through our great business houses, the general wealth and the high excellence of modern technique, offered the rarest opportunities to the artist, not perhaps for the immediate evolution of a new style but for a more complete and positive expression of present-day life and ambitions.

The Work of the Royal Engineers. "IT would be interesting to know," says Mr. Labouchere in "Truth," "how far the 'big building department' described by Lord Stanley on the vote for the staff and services for Royal Engineer works, &c., is in accordance with the recommendations of Lord Esher's Committee. This big department, according to Lord Stanley, is to be 'nominally under' but 'a separate department from that of the Inspector-General of Fortifications'; and all the Engineer officers employed in it are to be employed there for prolonged periods—I presume more or less permanently. Lord Esher's Committee, unless I am mistaken, strongly recommended the transference of building works to civilians, and that seems to me the only sound principle. All the scandals of the Army Works Department, from the days of the Dublin Barracks business downwards, have pointed to the inability of the Royal Engineers to properly supervise big building jobs; and there is no reason to suppose that the mere prolongation of their term of employment upon such work will make things any better."

Victoria and Albert Museum. PART of the quadrangle bordering the south court is approaching completion; but it has not yet been decided whether this will be utilized for exhibition purposes. Some additions have been made to the display of carved woodwork in the entrance from the Exhibition Road. The principal is an ecclesiastical screen of carved oak, with brass fittings (bookstand, candlesticks and ornaments), originally in a Dutch church, and dating from the beginning of the eighteenth century. The front is panelled in three compartments, of which two, for the elders, bear the inscription on scrolls, "Ouderlingh," and the other, for the preacher, the word "Predikant"; in each panel is also a shield of arms. A mantelpiece of carved stone is worth notice; it was taken from an old house at Norwich, and is early seventeenth-century English work. The treatment of the winged monsters in the decoration is bold and effective. On the opposite side is a cast of a Sussex fire-back, bearing the arms of Queen Elizabeth. In the north court there has recently been erected a fine screen of seventeenth-century date from a monastery in one of the Greek Islands. The central doors are panelled, and ornamented with figures of saints painted in the Byzantine style. The panelling on each side is separated by pillars. The order above is also panelled, and on the top are carved representations of the sacred dove.

ROADS AND STREETS.

AT a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on April 6th, a paper was read on "Road Maintenance and Administration" by Mr. Robert J. Thomas, M.I.C.E. He said there were now 26,978 miles of main roads in England and Wales, as compared with 18,070 in 1889, and that sixty county councils were responsible for them; forty of whom had adopted direct management, the advantages of which he enumerated. Discussing materials and pointing out the enormous growth in the sale of granite during recent years to the exclusion of other softer stones, Mr. Thomas expressed the opinion that for country main roads a size not exceeding 1¾in. or 2in. gauge was the most desirable, and that too much reliance should not be placed upon tests made under artificial conditions not met with in the daily wear-and-tear of roads. Giving the results of tests made in actual wear, he stated that on a country main road, granite surface, steam-rolled, with an ascertained traffic of 100,000 collars per annum, the actual wear averaged 1in. in five years, that 1·5in. wear took place along the 7ft. in centre, and rather more than ½in. along each of the 6ft. 6in. sides.

Referring to Metropolitan and town streets, and to the exaggerated statements made relative to the streets of foreign towns being so much better than those in London, the author instanced towns in Russia which had been held up as patterns, although they were anything but satisfactory. He laid stress on the unique size of the Metropolis, its variations of climate and temperature, the phenomenal traffic, and particularly the power which companies had been given by Parliament to cut open and block streets, and which was exercised to such an extent that the rights and access of the public to their own thoroughfares were already small and fleeting and the costs of restoration of surfaces enormous; all which might be obviated if subways were constructed and the companies compelled to move their pipes and cables into them. He expressed the opinion that slow traffic should be better regulated, that vehicles should be kept close to the near side of the street, that omnibuses should stop at fixed points, and that the loading or unloading of railway and other goods vans should be prohibited in busy thoroughfares.

Admitting the necessity for tramways in large towns and their help in solving the housing question, the author strongly advocated that country roads should be widened to 40ft. where a double line of tramways was laid, in order to provide at least 12ft. of metalled roadway at each side.

New road construction for motor and other fast traffic he did not consider feasible, but suggested that the cost of widening existing roads in rural districts sufficiently to provide a dry hard track might be borne by the State, a tax at per h.p. per car being levied sufficient for its up-keep, which tax would necessarily diminish as the number of motors increased.

FIRE-STATION DESIGNS.

ARCHITECTS who have designed fire stations are requested to communicate with Mr. Frederick R. Farrow, F.R.I.B.A., of 29, New Bridge Street, E.C., not later than Saturday, April 25th, with the view of the possible exhibition of perspectives, elevations, photographs or plans of modern stations in the architectural group of the forthcoming International Fire Exhibition at Earl's Court.

Watford.—Accepted for the erection of detached residence, Whippendale Road, Watford, for Mr. R. John. Mr. S. Doddimeade Edmunds, architect and surveyor, 79, Victoria Street, St. Albans :—

Henry Brown, Watford £799

Builders' Notes.

The Brickmakers of Wigan and the neighbourhood have struck for an advance of 1d. per 1,000; they require also that the brick shall be moulded to one size, namely, 10in. long, 5in. broad and 3in. thick. This, we believe, will make a difference of from 4d. to 6d. per 1,000.

Tasteful and Spirited.—Three workmen employed to do some building alterations in the basement of a Newcastle restaurant cut a hole through the brick wall of the wine cellar and helped themselves to eleven bottles of brandy and six of champagne. They have been sent to hard labour for two months.

A New Paving.—Mr. A. W. Moore, of 12, Chatham Place, Hackney, has invented a new system which is being tried by the Corporation of Westminster. The ordinary wood-block road has the obvious defects of slipperiness and insanitation. Mr. Moore relies for a road foundation on perforated iron trays or plates, upon which wood blocks specially prepared for drainage are laid. The paving can also be used for platforms, floors and stairs.

A Novel Invention in Water Taps has just come under our notice. It is a combination tap (Webb's Patent) owned by the Combination Tap Co., Ltd., of 24, Queen Victoria Street, London, E.C. This tap, besides being fitted with Webb's anti-splash arrangement, has also an easily-worked adjustment which at once converts it into a hydrant, thus furnishing every householder with a fire extinguisher, and one that will stand the pressure of the main. It will also be found useful for gardens, stables, warehouses, &c.

From South to North.—It is commonly supposed that the clannishness of the Scot is impervious to any save Scottish enterprise, but there is a vein of common-sense in the keenest Scot which leads him to do business with anybody who can supply a good article, and although Mr. John Stones, of Ulverston, is not a Scotsman, he has recently secured a valuable contract and placed a large run of his swivel partitions in Edinburgh itself—in St. Cuthbert's Roman Catholic Schools, where about 3,500ft. of these partitions have been fitted. This is only one selection of many similar contracts recently carried out by Mr. Stones.

Amalgamation of Tramway Contractors.—The firms of Messrs. Askham Brothers and Wilson, of the Yorkshire Steel and Engineering Works, and Messrs. Edgar Allen & Co., Ltd., of Imperial Steel Works, Tinsley, Sheffield, have amalgamated. Messrs. J. & P. Askham, who have carried the former works on so successfully for the past thirty-seven years in all kinds of tramway works, are now retiring from the active management of the same, and although the works are to be taken over by Messrs. Edgar Allen & Co., they will continue to be under the direct management of Mr. Fred Bland, who for many years past now has been so closely connected with all tramway work. He remains with the new firm as the director of the Tramways Department, so that the works under the existing staff will continue to be carried on as heretofore, only considerably enlarged at Tinsley, where Messrs Allen & Co. have purchased some 17 acres of land whereon to erect large and extensive new works for the grappling more effectually with their increasing trade in electric tramways, which is now of such a magnitude that there is hardly a corporation or leading tramway contractor who do not use their patent automatic spring points, which are so greatly in demand in the laying of all tramway lines.

Improving Calcutta.—A great scheme of improvement is being considered by the Commissioners of Calcutta. About 16 miles of new roads are contemplated in the scheme. Of these 9½ miles 60ft. wide are to run north and south and 6¼ miles 40ft. wide east and west. These roads will cost Rs. 4,78,00,000. The roads alone would transform the city. Calcutta needs nothing so much as wide clean roads driven, regardless of obstacles, through her congested quarters.

America's Greatest Brick Arch is stated to be in the Eastern States, under the Metropolitan Museum of Art in Central Park, and spans the great Croton water-pipes, which are 6ft. in diameter and ten in number, lying side by side. The dimensions of the arch are about 35ft. span with 6ft. rise and the brick ring is composed of eighteen rowlock courses of brickwork laid in thick grout, and bonded like a brick wall every sixth course. Its length is approximately 300ft. and it contains over 3,000,000 bricks. This arch was most laborious to build because the men were obliged to work on their knees on top of the centre and flat courses of the rowlocks.

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

April 29, 1903. Vol. 17, No. 429.

9, East Harding Street, E.C.

Clifford's Inn. We fear that the fate of Clifford's Inn is sealed. On May 14th it will be put up for sale, and there seems little doubt that very soon afterwards the housebreakers will be at work on this charming relic of Old London, to be followed by builders of offices and business premises. While admitting the requirements of modern London, we cannot help feeling that there is hardly sufficient justification for pulling down all these old buildings: indeed, some landlords seem to delight in clearing them away on the first opportunity, often more as a means of increasing their revenues than for reasons of sanitation or public need. On the other hand, we cannot sympathize with that class of outside artists who live in the past and protest at the mere mention of any modern alteration. With the formation of so necessary a thoroughfare as that from the Strand to Holborn, cutting through a portion of London whose old-fashionedness has been preserved by being out of the swirl of business streets, it is inevitable that something must be sacrificed; but not every demolition has such good grounds as this. We doubt whether there are any such justifiable reasons for pulling down Clifford's Inn. Many protests have been raised, not the least important being that the Record Office will become hemmed in and darkened by the new buildings. The proceeds of the sale are to be handed over to the Attorney-General for the purposes of "legal education"—that is, the giving of law lectures (Clifford's Inn is the oldest of the now disestablished Inns of Chancery, which were law schools to prepare students for the larger Inns of Court), but Mr. St. John Hankin observes that every sensible person must know "the whole system of lectures became antiquated and ridiculous after the invention of the printing press, and that only at universities and similar relics of a dead past have they the smallest claim to survive." Clifford's Inn, with is dull red-brick houses, its old hall and stony court, recalls the days of Dr. Johnson more vividly than any other part of London, and we shall be sorry to lose it. The old hall (in which the Society of Designers were wont to meet amidst their legion of spidery chairs) is chiefly memorable as being the place where Sir Matthew Hale and seventeen other wise and patient judges sat, after the great fire of 1666, to adjudicate upon the claims of landlords and tenants of the burned houses.

Wren and the Gordon Riots. The "Daily Chronicle" in a review of Miss Harting's book, "Catholic London Missions from the Reformation to the year 1850," describing the Sardinian Chapel in Sardinia Street, Lincoln's Inn Fields, which is soon to be demolished for the purpose of forming the new street between Holborn and the Strand, asserts that the chapel was burned and wrecked during the Gordon riots, and was rebuilt by Wren at the public cost. The critic appears to have been oblivious of the fact that the Gordon riots took place in 1780, and that as Wren died in 1723 it was impossible for him to have had any hand in the rebuilding of the chapel, which presents no feature of interest beyond that the interior was decorated some years ago from a design by the late John F. Bentley, the architect of the new Roman Catholic Cathedral at Westminster.

The Question of Taste. Drawing-room parlance has made the word "taste" rather a by-word, for it has been affectedly adopted as a convenient mask for the want of it. But true taste becomes one of the most important as it is the most absent matters in modern buildings. It denotes a sense of fitness and good proportion. Generalities about proportion and the relation of solid to void are for ever being harped upon, but they are very little appreciated, though there is perhaps nothing which architects lack more than this sense of good proportion. It is not insisted upon in this country as in France, and, though the comparison cannot be held solely applicable to that cause, the admirable proportion of the buildings of Paris and the absence of it in the majority of London buildings furnishes a very marked contrast: and for this reason alone one may say that the French architects have better taste than our own. In saying this, however, let us not be misunderstood. There are scores of English architcets capable of designing fine buildings for important thoroughfares of great cities who never have the opportunity of doing so: not that such an opportunity is altogether a golden one—there are always difficulties and complexities to hamper the architect—still, the buildings are often great piles capable of producing great effects. That these effects are so rarely realized is due to the fact that the architects commissioned to design these large blocks of city buildings are generally devoid of taste. We call to mind several huge new structures in the leading thoroughfares of London which are a disgrace to English architecture. To see the most puny detail and tasteless ornament on these proportionless façades makes one think that here at least the architect is nothing more than a tradesman. Business ability and architectural talent are not often found together, but we can demand something less atrocious than these buildings.

The National Trust. Mr. Bodley, we notice, has been chosen to fill the place of the late Mr. Penrose as the representative of the Royal Institute of British Architects on the Council of the National Trust—or, to give its full title, the National Trust for Places of Historic Interest or Natural Beauty. The Trust does its work quietly but, nevertheless, effectively. In our issue for November 27th, 1901, we published an illustration of the old post-office at Tintagel, an interesting building of the fourteenth century, put in repair by the Trust in 1895 at the expense of a number of artists and others interested in its preservation, and we now learn that the Trust has sufficient funds to purchase the little building; so that its future is assured. The Trust is protesting against the outrageous proposal to construct a harbour district railway along the East Cliff at Hastings. Everyone familiar with this beautiful spot will heartily endorse such a protest, and we hope there will be sufficient opposition to the Bill before Parliament to prevent any such disfigurement being carried out.

A So-Called Crozier. The so-called crozier discovered by the rector of Alcester, Warwickshire, in the rectory garden, and purchased by the British Museum for £100, is not a crozier but the ivory head of a Tau-cross staff of English workmanship, dating from about the year 1020. It is conjectured that the staff-head was made for Evesham Abbey, and it is now on view in a case in the centre of the Mediæval Room at the British Museum. The carving is of singular beauty and is very little injured. It is stated that the rector of Alcester intends to devote the money he has received for his find towards the restoration of the chancel of his church, but it is to be hoped that he will confine himself to necessary repair and will not lend himself to anything so mischievous as restoration, which is now almost universally discredited.

THE NEW WORKS AND OFFICES OF THE BRITISH WESTINGHOUSE COMPANY AT MANCHESTER.

THE WESTINGHOUSE WORKS.

THE history of the construction of the new works of the British Westinghouse Electric and Manufacturing Co. at Trafford Park, Manchester, is of particular interest as a record of what British labour can do when efficiently directed. The foundation-stone of the works was laid on August 3rd, 1901, by the Lord Mayor of London, and, despite their magnitude, actual manufacturing operations commenced within twelve months of that date. We doubt if even our Transatlantic cousins can show a performance to beat this one, carried out with British labour and material under the direction of a Scottish building manager having American training, with perhaps a dozen young assistants. The material used in the work of construction comprised 11,000,000 bricks, 17,000 tons of steelwork, 9,000,000ft. of timber and 300,000ft. of glass roofing. All the shops (seven in number) are of steelwork bricked in, the upper floors and roof principals being supported on built-up steel columns set on solid concrete foundations and tied with heavy cross girders. Runways for great electric cranes of up to 50 tons capacity and 90ft. span are provided high up in the main bays of all the shops, and in some cases in the side bays also. Largest and most interesting is the machine shop, part of which is seen in our illustration behind the high-office building. This is in five aisles, numbered in order, A, B, C, D and E, of which B and D are clear from floor to roof, a height of about 100ft. Each aisle is about 90ft. wide by nearly 1,000ft. long. A, C and E have two working floors, and in addition a mezzanine floor, mainly occupied with lavatories. The flooring of the upper storey consists of stout planking laid on edge, the planks being held together by long through bolts; over this is laid a light wooden flooring in the usual way. This system, which is distinctly novel, provides an excellent foundation for machine tools of moderate size, eliminates vibration, and is much more fire-resisting than many nominally fireproof structures. Almost the whole of the roof-surface is glazed, the glass used having been cast on wire-meshing, which so strengthens it that, though comparatively thin, a man can safely walk over it. Even if it should break, the wire-meshing would prevent any large pieces falling to injure the workers beneath. Small condensation gutters are fitted inside at the bottom of each pane. Excellent provision has been made for ventilation, the foul air being forcibly expelled by fans and fresh air (in winter warmed by passing over steam pipes) drawn in. Both in summer and winter the entire works are maintained at a suitable temperature. Lighting is by electricity throughout, Westinghouse Bremer arc lamps, which give a powerful light of very agreeable colour, being used in the main bays, and incandescent lamps elsewhere. The office building has six floors, with about 75,000 sq. ft. of floor space. The entrance halls are panelled and the staircases cased entirely with white marble. All furniture and work is of polished oak, and each office is provided with a combined lavatory and wardrobe cabinet. Each room also contains a clever device consisting of a thermometer and a small lever connected to a pointer travelling over a scale. This lever controls the main radiators of the room, and the device is so arranged that the temperature can be kept constant at any desired value. One end of the building is of fire-resisting construction, and in this are stored the drawings, records and other valuable property. The total area of the site owned by the British Westinghouse Co. is 130 acres, of which at the present time about 20 acres are built upon. The position is one admirably suited for a large manufactory, being closely connected to the railway system and bounded on two sides by the Bridgewater Canal, while the Manchester Ship Canal is close at hand. Adjoining the works a town of more than 500 houses has been built by the Trafford Park Dwellings Co.; this town is rapidly growing, and affords accommodation for a large number of the operatives employed in the Westinghouse Works. The houses have electric light, bathrooms with hot and cold water, and gardens. The whole estate is run on teetotal lines—there is no public-house within a mile and a half of the shops. The works were designed by Mr. Thomas Rodd, architect, of Pittsburg, and carried out under the direction of Mr. J. C. Stewart, manager of the construction department of the British Westinghouse Co., who has already acquired a most enviable reputation as a "hustler."

A new Roman Catholic Church in East Ham has been erected.

The International Society of Sculptors, Painters and Gravers has leased the New Gallery, Regent Street, for the seasons of 1904–5 and 1906; and the Society's first exhibition in these Galleries will be opened in January next. The president of the International is Mr. Whistler, and among the members of the committee are Messrs. Guthrie, Lavery, Thaulow, Sauter, Sullivan, Pennell, Walton, Hemy, Crahall, Stirling Lee, Priestman and Harry Wilson.

THE "MORNING POST" AND "GAIETY" BUILDINGS.

THE premises of the "Morning Post" at the corner of the Strand and Wellington Street, London (which, together with the Gaiety Theatre and Restaurant, are about to be demolished in forming the new crescent), were completed in 1893, from the designs of Mr. H. O. Cresswell, on the site of the old "Field" and "Queen" offices and adjoining the old building of the "Morning Post" which previously existed at 12, Wellington Street, and which was incorporated with the new building when complete. The principal object of the extension was to obtain space for new machinery and to accommodate the staff of the advertisement and manager's departments, who had previously been housed on the opposite side of the street in the old wings at each side of the entrance to the Lyceum Theatre; but in addition to this the extension required a complete reorganisation of all the various departments so as to bring them into proper relation with each other. In the basement was placed the machinery and on the ground floor the advertisement and cashier's departments, on the first floor the manager's department, on the second floor the editorial department with caretaker's rooms over, and on the top floor the composing and readers' rooms, with the stereotyping department just below, in the old building. The whole of the buildings were of fireproof construction on Fawcett's system, and were very substantially erected, as there was no idea at the time they were built that they would be likely to be pulled down within ten years. When the new Holborn to Strand Improvement scheme was introduced by the County Council Lord Glenesk, as proprietor of the "Morning Post," opposed the scheme in Parliament, and opposed it so successfully that the County Council, to get rid of the opposition, offered to reinstate the existing buildings on a new site as closely adjoining the old one as possible, and similar terms were subsequently obtained by the Gaiety Theatre and Restaurant and at a later date by Short's, Ltd. The new premises will be erected on the triangular piece of ground bounded by Exeter Street on the north, by the new street on the east, and by Wellington Street on the west, and will be the work of a foreign architect.

The Gaiety Theatre was erected in 1868 under the direction of Mr. C. J. Phipps. It occupies the site of the old Strand Music Hall. The internal decoration was first done by Mr. George Gordon, and there was a frieze over the proscenium designed and painted by Mr. H. S. Marks, 30ft. long and 4ft. 6in. deep, representing a mediæval king and queen, with their courtiers, watching the performance of a masque. The building is of brick, arranged in coloured bands here and there on the wall surface and over the window heads: while the capitals of the columns are foliated in early Gothic character. The theatre is an interesting example of the Gothic Revival. The new Gaiety Restaurant and Theatre is being erected opposite the old one, and will face the new "Morning Post" building to be erected on the other side of the crescent.

MODERN TERRA-COTTA AND FAÏENCE.

By J. MILLER CARR.

A MEETING of the Society of Architects was held on Thursday last at St. James's Hall, Piccadilly, when a paper on "Modern Terra-Cotta, Constructional Faïence and Ceramic Mural Decoration" was read by Mr. J. Miller Carr (of Doulton's).

Mr. Carr said that the history of modern terra-cotta should, perhaps, begin with the works of Coad, Blanchard & Blashfield, and he exhibited some fragments of pieces made by them at Lambeth more than 100 years ago. The figure of Britannia on the dome of the Liverpool Exchange is also an example of Lambeth manufacture of about that date; and though exposed to very severe ordeal from the acid fumes of the district and the full force of sea air, he believed the figure was in a perfect state of preservation. The dressing above the ground floor to the Sun Office at Charing Cross may be mentioned as a little-known example of Blashfield's work, and the entrance gateway to Sion House, Isleworth, is another example of work done more than 100 years ago.

Mr. Carr continued :—The one idea of all the makers of that period was to produce a clever and exact imitation of stone—truly an unworthy motive; but as to their success my reference to the Sun Office will suffice, as I think it probable most of those present will have accepted that as Portland stone. The early part of the past century was a time when all kinds of imitations and frauds were not only tolerated but fashionable; and surely it is one of the most hopeful and wholesome signs of our times that these deceptions have lost their charm and no longer obtain any hold on the educated public.

We may say that the *true* modern use of terra-cotta began with the building of

The Natural History Museum

at South Kensington, and I think it is a remarkable achievement for an architect to have demonstrated so true a use of the material at his first essay on any such large scale. Perhaps someone will say the colour is raw and somewhat aggressive. It is true also that mistakes were made and manufacturers practically ruined by supposing that because the material could be made cheaper than stone that it could be made *ridiculously cheaper than* stone—but every good cause has had its martyrs, and I think it should be recognized that such a fine building, so suitable for its purpose and of such an enduring nature, was indeed a triumph as almost a first attempt to use a practically new material. I have heard it remarked that the Natural History Museum looks almost as clean to-day as when first built—surely a valuable quality in our dirty atmosphere. Much has been learnt since its erection, and many different kinds of material have been tried in the manufacture of terra-cotta; delicate shades of colour have been obtained by combining clays from widely separated localities, and generally the manufacture may be said to have reached a high state of efficiency. Still, after about twenty-five years, one has to say that a large number of the designs recently produced for this material are not nearly so well adapted to its characteristics as this early example.

Typical Buildings.

I propose now to call your attention to a few typical buildings gathered at random, which will serve to show a large variety of style and purpose, pointing out those characteristics which indicate special suitability of design to the material.

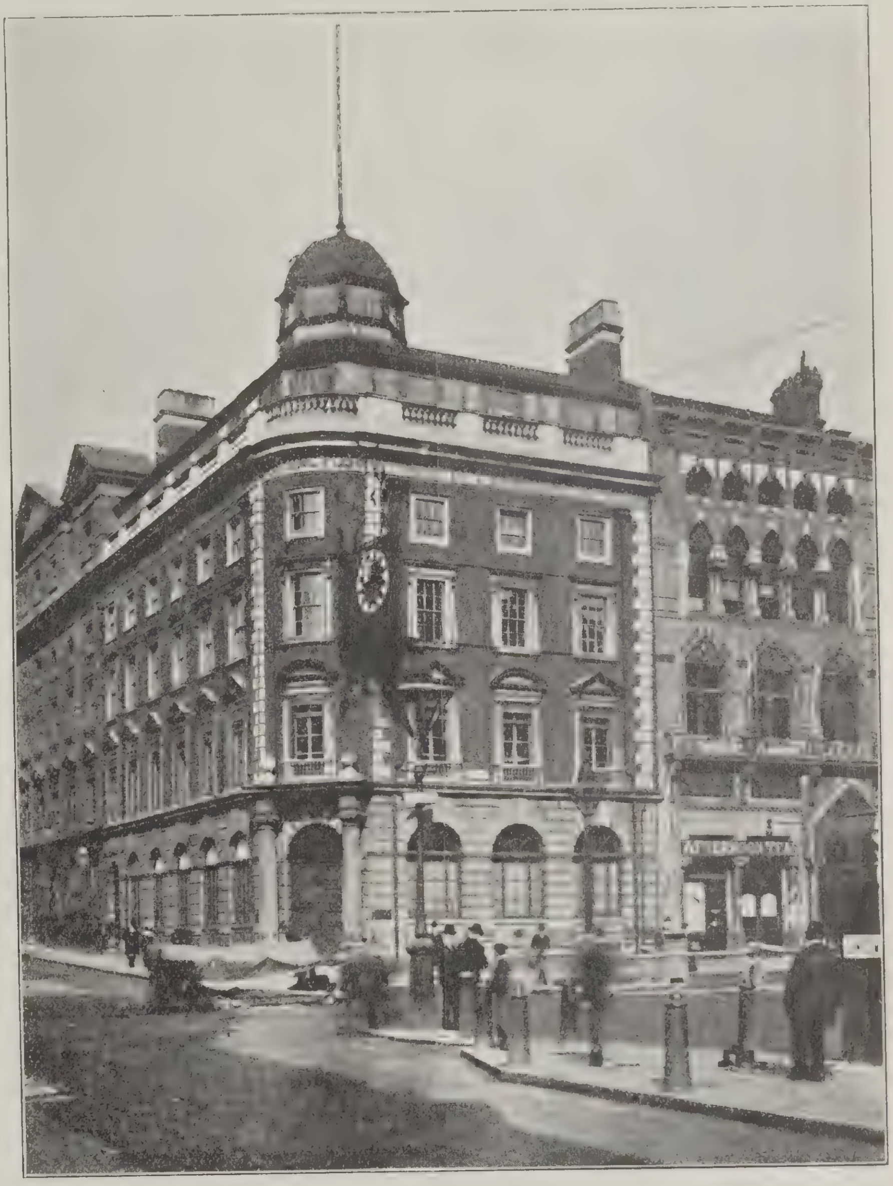
I suppose all will agree that it is a true principle, that the method of manufacture should be a motive in the design, that the architect should study his material, and that the most *characteristic* use of the material is its truest use.

Let us now look at the Victoria Law Courts at Birmingham, of which Mr. Aston Webb is the architect. The exterior is in red terra-cotta, with pleasing accidental variety of colour, but all red; whilst the interior is of a warm buff-colour. The design is exceedingly intricate, and both exterior and interior produce a very rich effect; but note what care has been bestowed on obtaining repetition of forms and features, while at the same time a different disposition of the features avoids monotony. The smallest details of this building repay the most careful study; everywhere it is evident that the material has been studied and that a true use of clay has been constantly kept in view; note the tracery in the great windows—how far it is removed in design from ordinary stone-like tracery.

The French Protestant Church in Soho Square, London, also by Mr. Aston Webb, is specially interesting in much of its interior work.

Now let us look at two of Mr. Collcutt's designs—Bechstein's in Wigmore Street and the Palace Theatre in Cambridge Circus. Note in both these designs how he gets shadow not by the projection of impossible cornices but by the arcaded method of producing deep recesses—note also the beautiful free modelled work. I am sorry to say the principal feature of the ground floor to the theatre, the entrance spandrels, are almost entirely hidden by the hideous iron shelter.

Next, in contrast to these examples by Mr. Collcutt and Mr. Aston Webb, let us look at a more classic type of building—Tootal's Warehouse in Oxford Street, Manchester, of which the late J. Gibbons Sankey, M.A., was the architect. We see at once that its great projecting cornices, its row of great columns and other similar features mark it as nothing like so suitable a design for the material as those examples previously noticed.



THE "MORNING POST" AND "GAIETY" BUILDINGS IN THE STRAND (ABOUT TO BE DEMOLISHED).

The Higher Grade Schools at Aston, near Birmingham (Messrs. Crouch & Butler, architects), have many features which are specially well designed for terra-cotta, but some that one cannot regard otherwise than forcing the material out of its proper field, as, for instance, the enormous projecting cornice about 3ft. over the wall face, with a modelled trophy in the pediment projecting about 1ft. more. This, of course, is hung up by copper rods and cramps.

A good example of an entire terra-cotta front for a city property is Mr. Charles H. Worley's building in New Cavendish Street, while for theatres Mr. Ernest Runtz's designs at Middlesbrough, Peckham and Hastings show a successful use of the material either alone or in conjunction with brickwork. The General Hospital at Birmingham, of which Mr. Henman is the architect, possesses many interesting and some unique features; notice the corridor ceiling in which two colours are used, red ribs with buff panels: the latter are about 2ft. sq. and 4in. thick, the usual hollow back being made the means of attachment to the iron girders, which are buried in concrete; the concrete then holds up the ceiling panels without any special preparations.

One of the most striking features of modern Birmingham is its ramification of covered arcades. The interior of the City Arcades (Messrs. Newton & Cheatle, architects) is in a special kind of faïence called Malchite, to which reference will be made when dealing with faïence materials.

A building which has attracted a good deal of attention is that recently completed for the Ocean Accident Guarantee Corporation, Ltd., in Temple Row, Birmingham. This is in a special kind of grey terra-cotta finished with a dragged surface. Messrs. Mansell & Mansell, of Birmingham, are the architects, and they were very anxious to avoid meaningless ornament.

Mr. A. H. Kersey is the architect of the front of Messrs. Redfern's premises in Conduit Street, London, W. The multiplicity of fine vertical lines in this building, where the pilasters are not only fluted and reeded but in addition have a **V** in each fillet and other special characters about the work, rendered it desirable to carry out nearly the whole of the work by what are called direct methods, *i.e.*, without the assistance of plaster moulds. The building was originally designed with a pair of fine architectural grotesques supporting the hood over the entrance, but these were considered by the clients to be "indecent," so that they were removed and trusses of a totally different kind introduced after the building was completed. The beautiful bas-reliefs were modelled by Messrs. Elmes & Son, of Kensington. The special construction of the hood over this entrance is interesting. It is formed of interlocking blocks which neutralize the outward thrust and make the hood into practically an elliptic lintel; at the same time ducts are provided in the thickness of the material for the passage of electric wires for the lamps in the coffered soffit.

Our list of terra-cotta buildings would be incomplete without examples of some of the great modern hotels, such as the Great Central (of which Colonel Robert Edis is the architect), and the Hotel Russell, by Mr. C. Fitzroy Doll, both being good examples of modern use. The great hotel is surely the most telling example of active life. It will therefore be an entire contrast to look at two resting-places of those who have passed from its busy scenes—Sir Henry Doulton's mausoleum at Norwood Cemetery, and the Stearne mausoleum at Nunhead. With these examples we pass from the consideration of general design to details of manufacture, and we will next consider the range of colour available for use in terra-cotta.

An immense range is possible, from a pale milky white, through all gradations of yellow and buff, to burnt sienna and red, and on through purple to the familiar blue brick; all of which gradations can be obtained from different kinds of clay and their combinations, and by different kinds of fire.

(Mr. Carr here exhibited four blocks, respectively buff, cinnamon, grey and red, each of which had been broken in two, and one half fired in a terra-cotta kiln and the other half in a blue-brick kiln—showing a surprising difference in colour.)

Almost all colour in terra-cotta is due to the oxidation of the varying quantities of iron contained in the different clays. It is possible by using an oxidizing fire to develop all the colour of which a particular clay is capable, or by what is called a reducing fire to repress the colour, so that a block which might be almost red under certain conditions of fire would be nearly white under others.

Now, as it is (fortunately, I think) practically impossible to exactly control the conditions within a large open-fired kiln, we have the natural result of variety of colour produced on the same material. This characteristic quality of the material—its charm *and the hall-mark so to say of its having been among the ardent tongues of the kiln flames*—is much better appreciated by architects to-day than it was fifteen years ago, when the profession almost universally specified uniformity of colour, which, of course, the manufacturer had to try to obtain, to the great detriment of the material.

Mr. Alfred Waterhouse did good service to the craft when he coined the phrase—that he desired to have on his building the results of the "accidents of the kiln."

But there are other possibilities by the admixture (at the time of grinding the clay) of certain mineral oxides, and with these various kinds of greys and greens and even pale blues can be obtained. Such stained "bodies" are naturally of the same colour all through. Any attempts at surface colouring other than by fired glazes are of course highly reprehensive and are not practised by firms of high standing.

Cost.

On the important question of cost it may be sufficient to state that this is of course controlled by suitability of design and the amount of repetition of the several forms employed. It may be taken as certain that where the design is fairly well suited to the material the cost will be below what it would be, say, in Portland stone, and where the design is specially suited and highly elaborated with many repeated forms, such as in the Birmingham Law Courts or the Natural History Museum, the cost will be very considerably below that of the same design in Portland stone with the carving included.

Terra-Cotta and Iron Construction.

We must now pass on to the most modern type of buildings—such as are either constructed entirely of glazed ware of various kinds or consist partly of glazed ware and partly of terra-cotta; and as these almost invariably combine some kind of iron or steel construction in their design and execution, I propose to take them together as a special class. The Birkbeck Bank and the large block of buildings attached to it, with the new extensive front in Holborn, is, I suppose, by far the largest example of an entirely glazed building in this country. The whole of the exterior is in Carrara ware, the colours used being fawn, sage-green and ivory. The method of manufacture of this material produces beautiful accidental gradations of colour, so that dead uniformity is never to be found on even a large surface of theoretically the same colour. The new building at the corner of Fleet Street and Fetter Lane, for the "Sheffield Daily Telegraph," is another large example of this ware, and in this case it is nearly all ivory white—but it is only needful to imagine the difference between the effect produced by the ivory Carrara, with its soft and pleasing gradation, and what it would have been in, say, white glazed bricks!

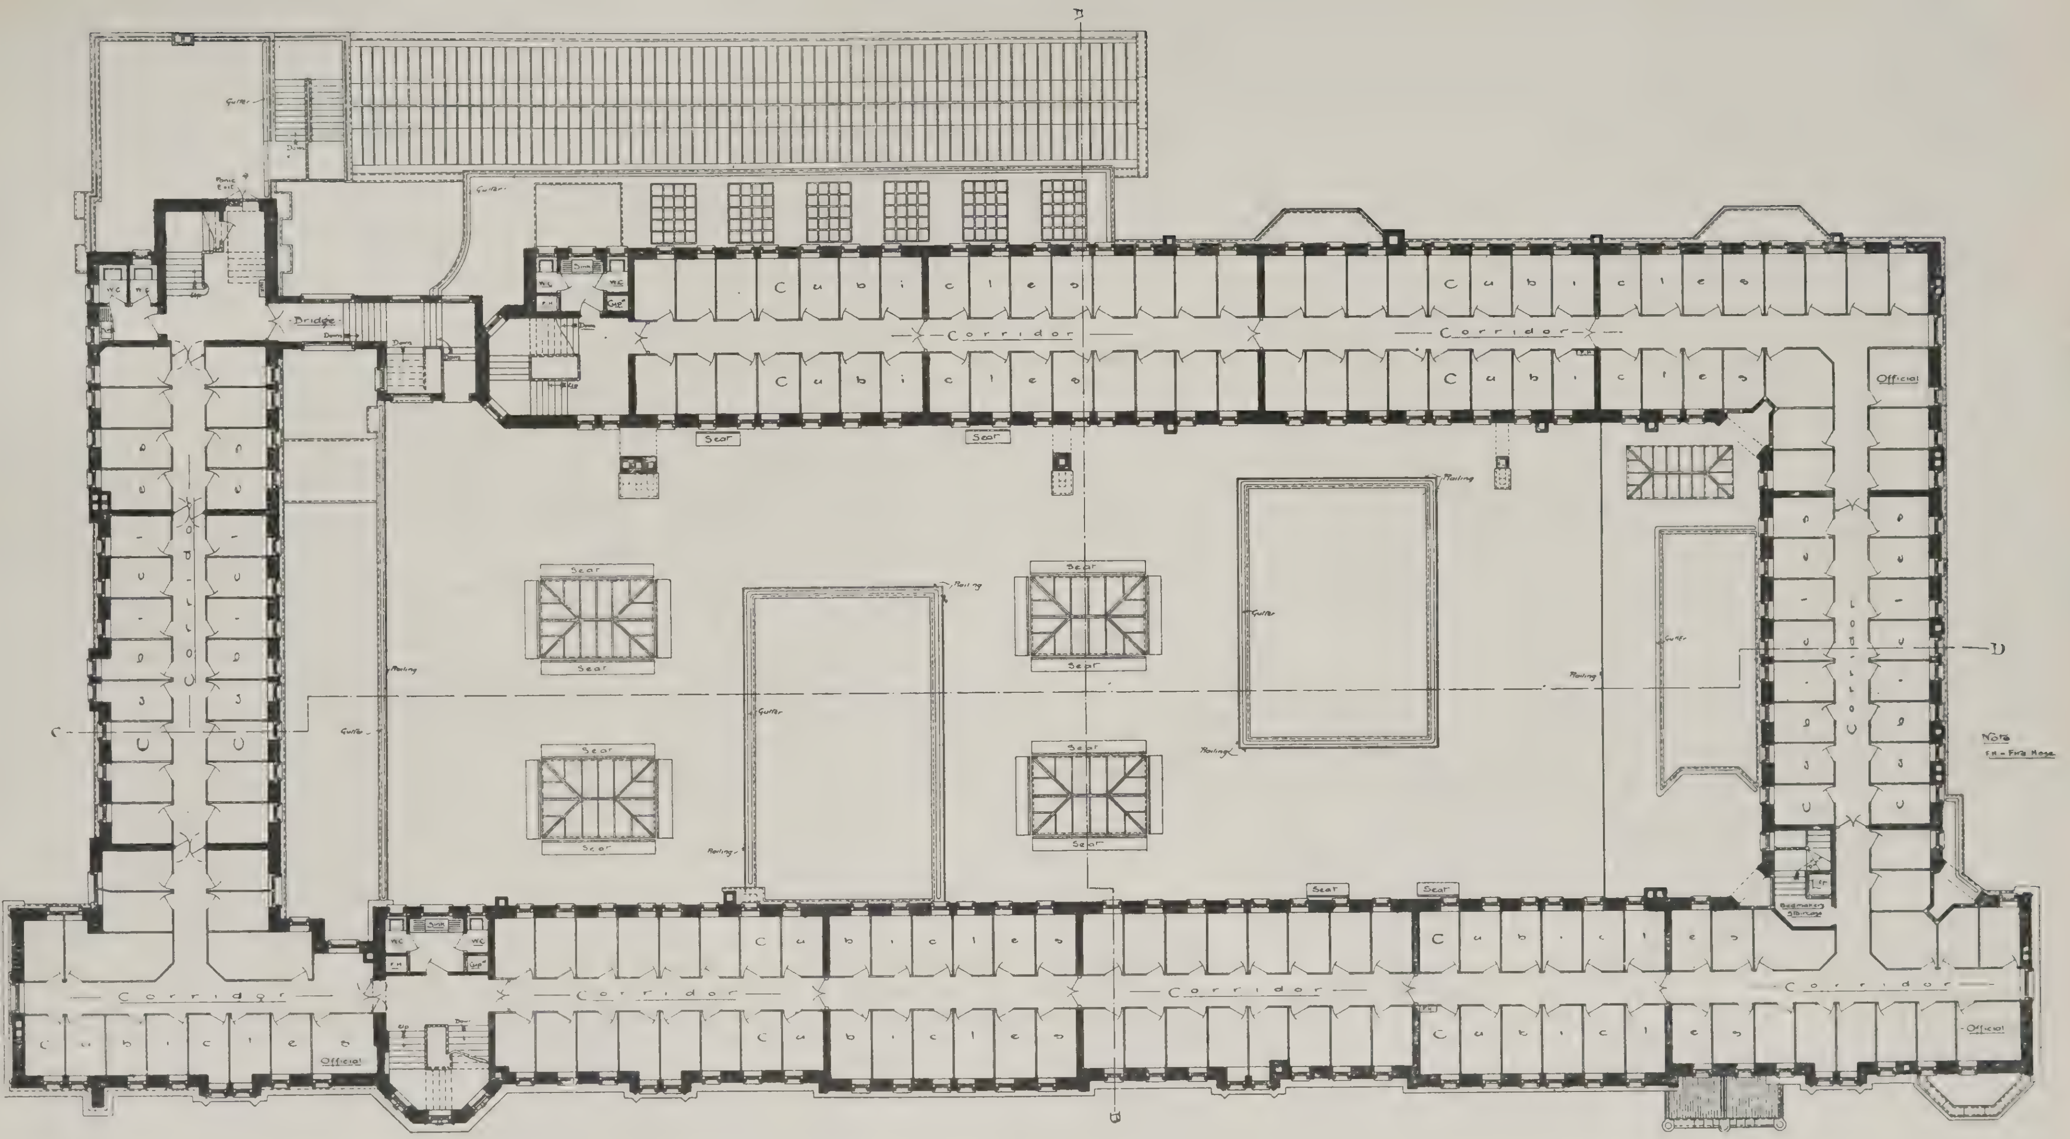
Referring again to the Birkbeck Bank, the whole of the interior of the banking-room, corridors, staircases and many of the principal rooms and offices are treated in various kinds of faïence, the boardroom being a specially fine example in purple, brown and cream colours. The panelled ceiling of this room, and also all the galleries to the bank, are covered with Doulton's patent safety-back tiles on their special preparation blocks, and have now stood the test of about seven years with no sign of weakness of any kind.

If you had told one of the grand old master-masons of the thirteenth or fourteenth century that you wanted a dome nearly 80ft. in diameter, and of a similar height, but could not allow any room to be taken up on the ground floor by abutments or buttresses, I think the good man would have regarded you as a cheerful idiot. But here these conditions are carried into actual fact, the dome being constructed of sixteen great steel stanchions, tapering from the floor and connected at their upper ends by a collar on which a gallery and lantern are carried. The stanchions and the spaces between them are covered with faïence, and the gore or carcase of the dome is of hollow terra-cotta blocks, light and strong, bonded together, with glazed panelled surface on the underside.

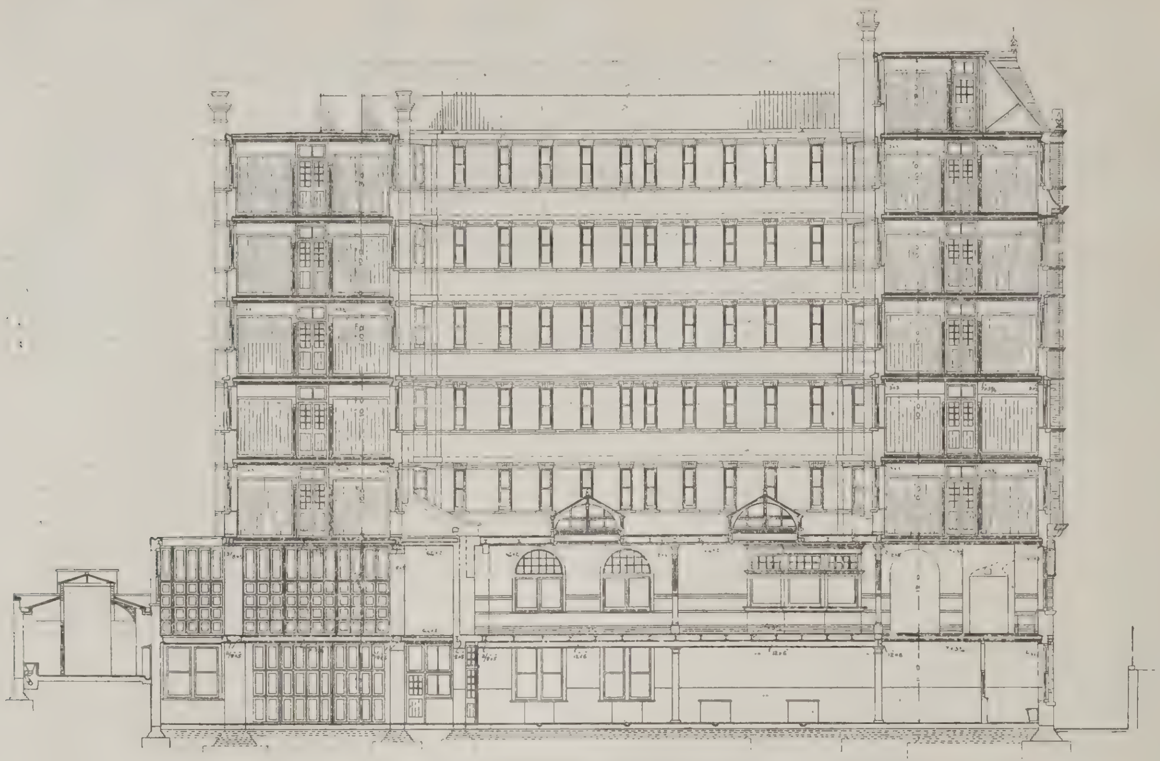
Work of this magnitude and importance naturally presents many interesting problems, in which the architect, engineer and ceramic expert may all have their share. Mr. T. E. Knightley, the architect, has certainly demonstrated the courage of his convictions on a large and important scale, and has shown in many points the true use of the materials chosen: for instance, in the great exterior columns to the upper parts of the Southampton Buildings front and to the great tower no attempt with large blocks has been made, but the plain entasized shaft between the enriched portions has been candidly built up of blue-green Carrara ware blocks not more than 10in. by 6in. on face, and consequently the broken colour produced by the difference of tone from block to block is pleasant, and at the same time substantial columns have been provided which carry the superstructure without the assistance of iron cores, except only those under the great tower.

The advantages offered by steel construction in connection with modern buildings are such, in lightness and strength, that they will doubtless demand increasing attention from architects and engineers, and I venture to say that there are no other materials so suitable as terra-cotta and glazed wares for casing such constructions. The usual practice is to let the engineer work out his structure in all its details, irrespective of the needful clothing which is to encase it, with the result that (his contract being already arranged) he cannot make such adaptations as are desirable to give the ceramist a fair opportunity of doing his best, and consequently the best is not done, but some kind of compromise.

In many parts of our country, if not in the streets of London, it will be found increasingly desirable to erect steel structures and to put the roof on perhaps before all the details of the elevation are arranged, and certainly new countries like many parts of South Africa need such structures in which the walls can be formed of rough local materials, so that while the internal parts are being completed materials to encase the steel structure can be obtained from England. These conditions are so novel that I think, if truly considered and architecturally treated, there should result a new style of architecture, the absolute growth out of the conditions. In this connection I may call your attention



ROWTON HOUSE, NEWINGTON BUTTS, LONDON, S.E : FIRST-FLOOR PLAN. HARRY B. MEASURES, F.R.I.B.A., ARCHITECT.



ROWTON HOUSE, NEWINGTON BUTTS, LONDON, S.E.: SECTION ON LINE A—B.

to a steel structure now in process of clothing with Carrara ware and terra-cotta in High Street, Leicester, the property of the architect, Mr. Arthur Wakerley, F.R.I.B.A., ex-president of the Leicester Society of Architects. The ground-floor piers are encased with blue-green Carrara ware for about 6ft. up, and then the general material of the clothing is grey terra-cotta relieved with light enrichments in cream colour. This bi-coloured effect is quite a new departure obtained by the use of two kinds of clay wedded as to skrinkage and worked together into the same block. The central bay is spanned by an elliptic arch of light section with the steelwork inside, and the spandrels are filled with light open work, modelled work, not suggesting that they carry the superstructure. It may also be noticed that there is no pretence of arch jointing in the long beams over the shop fronts, the material being simply treated as a casing of the steel girders.

Ceramic Mural Decoration.

I must now ask your attention to the most interesting part of my subject—ceramic mural decoration. I would first refer to what I consider to be one of the most courageous attempts yet made to get colour and interest into our street architecture. This building, erected above five years ago for Mr. Edward Everard, at Bristol, is a high-class printer's establishment, and was designed by Mr. W. J. Neatby, who at that time was one of Messrs. Doulton's principal artists. The whole front is in Carrara ware, with the figure subjects and other decorative features treated in slab mosaic. Now Bristol is a very dull sort of city and not easily aroused, but when the scaffolding was removed from this front the police had to regulate the traffic in Broad Street for two or three days. What I have to say about this front is that it is a genuine attempt to produce a building that can be read like an open book, just as the interesting fronts of the thirteenth and fourteenth centuries could be read by every passer-by. It is also essentially English, and not copied from any existing building at home or abroad. I know that the cry can easily be raised that it does not harmonize with its surroundings, but pull down the public-house on the one side, and the bank on the other, and give us a chance, and it would then be easy to bring them into harmony.

A profitable evening might be spent on tile-work alone, beginning with early examples and considering the work of the Moors at Granada, and so on to the more modern use, much of which I think fails in that *mural character* which all wall-decoration should have. If only we would learn from the ancient Egyptians and the Persians and Moors, we would not see that prevalence of worrying a wall with projecting mouldings, panellings, &c., but would return to broader decorative treatments in which the wall is allowed to retain its wall-like surface and the decorative effect is obtained by a suitable use of colour and pattern work. (Mr. Carr here, in conclusion, exhibited examples of Doulton ware tile-work in low tones of colour, strong rich blues and ever-varying effects, vitreous enamels, majolica glazes, Malachite and Fluxor, painted work, Carrara and Parian—an important example of painted Parian work is the new fish and game market at Harrod's Stores, Kensington, where twenty great roundels represent various kinds of sport.

A.A. OF IRELAND.

THE final meeting of the session of the Architectural Association of Ireland was held last week. Mr. F. G. Hicks, the outgoing president, delivered a valedictory address in the course of which he referred to the subject of examinations by the Royal Institute of the Architects of Ireland, which he was gratified to know was very favourably received by the members generally. He felt quite satisfied that the day was not so far distant when the profession in Ireland would have so benefited by the change as to reach the highest pinnacle of architectural renown, and he looked forward to some of them being awarded the Royal Gold Medal, which, he believed, had never yet been bestowed on a member of the profession in Ireland, though possibly it had been deserved. It was gratifying to know the Government contemplated spending some millions on technical education, and he hoped architecture and the other arts would not be lost sight of: a knowledge of them was quite as essential for the layman as for themselves, else how could they expect him to evince a desire for the beautiful or to appreciate it when he had got it? He looked forward to the time when the State would exercise some control over architecture and building. It might come with registration, if that ever came. He feared both were a very long way off; but Dublin bodies should not be allowed to entrust architectural work to incompetent men, to erect buildings with public money that would be an eyesore for a century—provided the buildings did not fall down. The lords of the soil should have no dealings with the jerry-builder or the jerry architect. If they wanted to develop building estates profitably, let them appoint an architect of repute, by whom all designs must be approved. He was glad to say this was done on some estates near Dublin, but he regretted that on other estates builders and architects were allowed to do just as they liked, with very disastrous results.

The following elections took place:—President, Mr. Charles H. Ashworth; vice-presidents, Messrs. H. Alberry and J. H. Webb; hon. treasurer, Mr. E. Bradbury; hon. librarian, Mr. T. Cullimore; hon. secretaries, Messrs. A. G. C. Millar and F. Hayes; hon. auditors, Messrs. P. F. O'Sullivan and G. R. Corringham; committee, Messrs. Hicks, Sheridan, O'Callaghan, M'Carthy, Beckett, Holloway, Mitchell, Geoghegan & Coleman.

A ROWTON HOUSE.

ROWTON HOUSE, Newington Butts, was the third of these "poor men's hotels" erected in London, the two preceding ones being at Vauxhall and King's Cross; since then a fourth has been built at Hammersmith and a fifth at Whitechapel. The Newington Butts house may be taken as typical of them all, though since its erection in 1897 some changes of detail have naturally resulted. The building is of pressed Leicester bricks and mingled gaults, with pinky-buff terra-cotta dressings. There are 815 cubicles. Latterly an extension has been made at one end and a laundry erected for dealing with the requirements of the various houses, and a building for disinfection purposes. A full account of this Rowton House will be found in our issue for March 20th, 1901.

Construction Notes.

Decay of Metals. An important contribution was made last week to the subject of the durability of metals in a paper read before the Institution of Civil Engineers by Mr. J. T. Milton, M.I.C.E., and Mr. W. J. Larke. The investigations seem to have been suggested chiefly by the consideration of the pitting of tubes of marine surface-condensers, but the principles brought out are not merely of importance in this direction only. The eating away of the metal into holes is called by the authors "corrosion," and where the metal retains its original form "decay." Chemical analysis of decayed portions shows that in copper-zinc alloys the process is mainly one of dezincification, or loss of zinc, while in cast iron, part of the iron (and possibly also of the manganese) disappears, the whole of the graphitic carbon remaining. A number of experiments have been made by Messrs. Milton & Larke, who summarize their investigations as follows:—(1) Decay was more frequent in metals which had a duplex or more complex structure than in those which were comparatively homogeneous. (2) Decay was due to a slower or less energetic action than that causing corrosion, and, moreover, it required an action which removed part only of the constituents of the metal, whereas corrosion removed all the material attacked. (3) Both decay and corrosion might result from chemical action alone, or chemical and electrolytic action combined. (4) Pitting, or intense local corrosion, was probably often due to local segregation of impurities of the metal; but it might also in some cases be due to local irregularities of surface or structure producing local irregularities in the distribution of galvanic currents. (5) In the case of brass exposed to sea-water, tin was distinctly preservative, while lead and iron were both injurious, rendering the brass more readily corrodible. The percentage of the latter elements should, therefore, be kept as low as possible in the case of all metal intended for purposes where contact with sea-water was inevitable. (6) With a view to obtain a minimum of corrosion, the internal surfaces of condenser-tubes should be as smooth and uniform as possible. (7) Experiments with an applied current showed that electrolytic action alone, even where exceedingly minute currents were in question, might result in very severe corrosion or decay. Every effort, therefore, should be made to prevent such action, by careful insulation of all electric cables. Where galvanic action is inevitable through the proximity of different metals exposed to the same electrolyte, the currents resulting should be neutralized by the application of zinc plates in the circuit, so arranged that they will be negative to both of the other metals.

Microscopic Study of Metals. These facts are but another proof of the importance of the investigations which have for some time been and are still being carried on as to the crystalline structure of metals. Various means are employed in these investigations, but chiefly the microscope. One great result has been shown, that the metals of commerce, *i.e.*, alloys or impure elementary bodies, are to be regarded as solid solutions, with their properties as continuous functions of their compositions. The investigations of Sir William C. Roberts-Austen have shown that steel is exactly analogous to an ordinary solution of a salt. The effects of the conditions of cooling upon the hardening of metals have been availed of from time immemorial, but it is only within the last few years that our knowledge has been placed upon a definite scientific basis, and that chiefly by the investigation, by microscopical analysis, of the changes in crystalline structure. It has been found that the tenacity of rolled steel varies inversely as the size of the grain. The size of the grains depends upon the temperature at which it is rolled. Rolling at too high a temperature seems to produce large grains, but within certain limits the higher the temperature of rolling the greater the strength and durability. But comparison can only be made in this way between steel of the same composition, for the greater the amount of carbon and manganese in steel the larger the grain will be and the greater its tenacity. Microscopic observations made by Prof. J. A. Ewing and Mr. W. Rosenhaim have also elicited the fact that when a metal under stress takes any kind of permanent set it yields by slips occurring on cleavage or "gliding" surfaces within each of the crystalline grains. Plasticity results from these slips, although the elementary portions of the crystals retain their primitive form and the crystalline structure of the metal as a whole is preserved. Resilience is the amount of energy which can be stored up in an elastic body and, if desired, given back again as useful work. The portion not given back as resilient work is spent in permanently deforming the body by causing the particles to move or slide over each other as stated, thus developing heat. The elastic deformation of a body does not develop heat. One thing seems certain from the investigations of recent years that the chemistry and physics of metals and metal alloys will soon have been so thoroughly studied that general rules can be evolved for practical use, so that it will be possible to proportion the elements and the heating to achieve almost any desired condition in the finished product.

H. K. D.

SHEFFIELD ARCHITECTS.

The annual meeting of the Sheffield Society of Architects and Surveyors was held last Thursday. The annual report was presented, showing a membership of 109. After recounting the work of the past winter session, it was stated that Mr. Holmes's lecture on "Local Taxation" and Mr. R. E. Leader's lecture on "Architects and Surveyors of the Past" had been printed for the use of members and others. No further action had as yet been taken by the Corporation in regard to the draft building by-laws. The report referred to the proposed competition for the Corporation's building scheme at Wincobank, and regretted the conditions issued by the Health Committee were not satisfactory. Satisfaction was expressed that provision would be made for architectural education at the School of Art and Sheffield University College. Messrs. E. M. Gibbs, T. Swaffield Brown and W. C. Fenton had been appointed managers of the School of Art in connection with the new Education Committee.—The following elections were made:—President, Mr. T. Winder; vice-president, Mr. E. Holmes; treasurer, Mr. F. Fowler; hon. secretary, Mr. W. C. Fenton. Council: Fellows—Messrs. P. Marshall, J. Smith, H. L. Paterson, R. W. Fowler, W. J. Hale, J. R. Wigfull and J. B. Mitchell Withers; Associates - Messrs. G. B. Flockton, C. M. Hadfield and C. F. Innocent. The following resolution was unanimously agreed to: "That inasmuch as the conditions of competition for artisans' dwellings at Wincobank require a partnership between architects and builders, which is unprecedented and undesirable in the interests of all parties, this meeting recommends members of this Society to unanimously abstain from competing, unless that and other unsatisfactory conditions are altered so as to meet with the approval of the Council of this Society."

Views and Reviews.

Tarsia.

This book appears opportunely at a time when renewed attention is being given to intarsia and marquetry, more especially as it is the only book in English dealing exclusively with the subject. Besides studying the best examples to be found—chiefly in Italy—the author has consulted the numerous treatises published abroad and gives a list of them in his preface. The greater part of the book is devoted to a history of intarsia, the remainder being occupied by a description of the processes of manufacture, the limitations and capabilities of the art, and workshop receipts: the whole being fully illustrated from photographs and drawings. Intarsia is properly a solid inlay with wood or other material, while marquetry is the more modern practice of cutting several sheets of differently-coloured thin wood superimposed, the pieces being interchanged so as to get varieties of ground and design. Inlay, of course, goes back to antiquity—it was done by the Assyrians and Egyptians and its use continued in Greek and Roman days: but intarsia proper is not found till mediæval and Renaissance times. Siena was the cradle of Italian carving and inlaying: in the cathedral there, and at Orvieto as well, tarsia was made about the middle of the thirteenth century. Of the works that followed in Florence, Perugia, Venice, Lucca, Pavia and other Italian cities, of the cloistered intarsiatori and their pupils, and of the work done in Spain, Germany, Holland, France and England, we have not space to deal: they are all very adequately treated in this book.

Processes of manufacture are similarly considered from past to modern times, though the author is descriptive and comparative rather than historical. "At the commencement of the Renaissance the fancy of the intarsiatori overflowed in the most graceful arabesques, which are perfectly suited to the material and are often executed with absolute perfection, and these may perhaps be held to be the most entirely satisfactory of their works, though not the most marvellous. The ambition of the craftsman led him to emulate the achievements of the painter, and we find, after the invention of perspective drawing, views of streets and other architectural subjects, which are not always very successful, and the representation of cupboards the doors of which are partly open, showing objects of different kinds on the shelves, which are often rendered with the most extraordinary realism, when the means adopted are considered"—a realism which was accentuated by Fra Giovanni da Verona's discovery of acid solutions and stains and the practice of scorching the wood for shading. With the introduction of the fret-saw and the resulting counterchanging of ground and design, marquetry took a more commercial aspect, but much modern work shows how destructive the ease of this duplicating process has become, for the durability of marquetry very largely depends on the close fitting together of the pieces, instead of which they are often ill fitted, packed between with a filling material, and the surface lavishly polished.

This work is the first of a series for the craftsman: other volumes by the same author will deal with mural painting and mosaic and marble inlay.

"Intarsia and Marquetry," by F. Hamilton Jackson, R.B.A., Examiner to the Board of Education in Principles of Ornament. London: Sands & Co., price 5s. nett.

Southwark Bridge.—The Lord Mayor of London stated last week that the improvement of Southwark Bridge was under consideration, and that it might result in the rebuilding of that bridge at an expenditure of between £300,000 and £500,000.

ROWTON HOUSE, NEWINGTON BUTTS LONDON, S.E.: GROUND-FLOOR PLAN. HARRY B. MEASURES, F.R.I.B.A., ARCHITECT.

Keystones.

Mr. Aston Webb's next "At Home" as P.R.I.B.A. will be held on May 11th, when a collection of drawings by the late W. Eden Nesfield will be on exhibition.

The Architects' Registration Bill was introduced by Mr. Atherley-Jones into the House of Commons last Friday and read a first time.

A Memorial Window to London Scotsmen who fell during the war in South Africa has been erected at the Church of St. Columba, in Pont Street, Belgravia, by Messrs. Powell & Sons.

A Sequel to the Colney Hatch Fire.—The Works Committee of the Metropolitan Asylums Board have accepted estimates for the demolition of temporary wards at the South-Eastern and South-Western Hospitals at a cost of £43 and £89 10s.

The Whitley School Board Competition has been won by Mr. W. H. Knowles, of Newcastle-on-Tyne. Messrs. Cackett & Burns-Dick have been awarded the second premium of £40, Mr. Stephen Wilkinson the third premium of £20, and Messrs. Armstrong & Wright the fourth special award of £10.

Knossos.—Mr. Macmillan publishes a telegram from Mr. Arthur Evans announcing important discoveries at Knossos, in Crete, including a double flight of steps on the west of the north court to the palace. Considerable extension of work is entailed by these developments, and the managers of the Cretan Exploration Fund desire to raise another £2,000.

St. Mark's Campanile.—The first stone of the new Campanile of St. Mark at Venice, the building of which has been entrusted to the architect, Signor Luca Beltrami, was laid on Saturday. The tower is to be a replica of the former one. About £60,000 has been collected in Italy to bear the cost, and Sir Edward J. Poynter has forwarded £1,000 as the Royal Academy's contribution to the rebuilding.

Rochdale's Victoria Memorial.—The plans of Messrs. Woodhouse & Willoughby, of Manchester, have been accepted for a new nurses' home on the site of the Grammar School, Sparrow Hill. Nine sets of plans were sent in for the competition. Mr. H. Littler, of Preston, the county architect, was the assessor. The second premium of £20 was awarded to Mr. Jesse Horsfall, of Todmorden, and the third of £10 10s. to Messrs. Butterworth & Duncan, of Rochdale.

Archæological Discovery in Crete.—The Italian Archæological Mission has discovered near Herakleion, in Crete, on the site of ancient Phæstos, a magnificent palace and various objects of exceptional interest analogous to those observed at Knossos. The objects include twelve bronze statuettes, metal vases with repoussé ornament, painted vases and several tablets with inscriptions in the undeciphered Knossos character. The excavations will be continued.

The New Baltic and Shipping Exchange in St. Mary Axe, which was opened last week, covers an area of nearly one acre. On the ground floor is the large central hall, which has an extreme length of 152ft. and a width of 136ft. The whole of the front in St. Mary Axe, up to the first floor, is in polished Norwegian granite, above which there is a series of polished granite columns with carved capitals surmounted by a pediment. Above the exchange are four floors of offices approached by two entrances, staircases and lifts. The whole of the work has been carried out by Messrs. George Trollope & Sons from the designs of Mr. T. H. Smith, the architect.

A new Independent Church at Ilkeston is to be erected from designs by Mr. H. Tatham Sudbury, architect, of Ilkeston.

Rowston Church, near Digby, has been restored under the direction of Messrs. W. Watkins & Son, architects, of Lincoln.

The Royal School of Art Needlework, Imperial Institute Road, S.W., will be opened to-day by H.R.H. the Prince of Wales.

Change of Address.—Mr. G. H. Paine, architect and surveyor, of 6, Stoke Newington Road, Kingsland, N., has taken more convenient offices at No. 62, Moorgate Street, E.C.

The New York Stock Exchange has been opened. Its site makes it the costliest building in the city, with the exception of the Tweed Ring Court House, the construction of which enriched and ruined Tammany.

The Grand International Fire Brigades Council will, at the invitation of the British Fire Prevention Committee, hold its biennial meeting in London on July 11th in connection with the impending International Fire Prevention Congress which opens on July 7th, most of the members of the Council having expressed their intention of accepting the invitation of the Committee to attend the Congress.

Stockton-on-Tees and Gillingham Competitions.—The R.I.B.A. has endeavoured to get the conditions amended in the competitions for the Queen Victoria High School at Stockton-on-Tees and the Gillingham Public Baths; but without success. The promoters of the former competition say the conditions were framed by an architect of great experience and to meet special circumstances, and they do not feel at liberty to depart from them. The Gillingham Urban District Council considers that their conditions do not need any revision.

The Edinburgh Architectural Association held its annual general meeting last week, Mr. A. Hunter Crawford, F.R.I.B.A., president, in the chair. The treasurer's report showed that there had been exceptional expenditure, but that up to date there was a small credit balance. Among the office-bearers appointed were the following:—President, A. Hunter Crawford, F.R.I.B.A.; vice-presidents, H. O. Tarbolton, J. Stuart Syme; hon. secretaries, William M. Page, Colin B. Cownie; hon. treasurer, W. Glassford Walker, C.A. In his closing address the president said that the membership, now 358, was the largest attained in the history of the Association.

Obituary.

Mr. William Evans, builder, of Llandudno, died recently at the age of seventy-four.

Mr. G. Stafford, a well-known master-joiner and builder of Chester, died recently at the age of forty-six years.

Mr. H. Wheatley, contractor, of Cranbrook Road, Chiswick, was killed last week while cycling. Mr. Wheatley built a great number of houses in Chiswick and the neighbourhood.

Mr. David Martyn, builder, of St. Dennis, died recently at the age of sixty-four years. He was in partnership with his son, Mr. W. T. Martyn. In the china-clay industry he was an expert in the erection of kilns.

Mr. J. F. Hughes, builder, of Utica, U.S.A., died recently. Mr. Hughes was a native of Llangerniew, Denbighshire, and emigrated to the United States about thirty-two years ago, after living and working in Llandudno, Liverpool and Manchester. By trade he was a builder, and he gained the reputation of being the best and largest builder in Utica. He was for many years the president of the Builders' Exchange, and a prominent member of the Utica Chamber of Commerce.

Builders' Notes.

The Corporation Fever Hospital, Bradford has been supplied by Messrs. E. H. Shorlan & Brother, of Manchester, with more of thei patent Manchester stoves with descendin smoke-flues.

The Junior Institution of Engineers held meeting last Friday, the chairman (Mr Kenneth Gray) presiding, when a paper, whic we shall publish next week, was read b Mr. R. W. Newman, A.M.I.C.E., vice-chai man, on "The Effect of Design on Methods c Construction from a Contractor's point c View." The author sailed on the followin day for South Africa to take up a Colonia Government appointment as engineer on th construction of the Thebus Irrigation Work Cape Colony. Mr. H. Cartwright Reic M.I.C.E., member of the Council of the Institution, will shortly be leaving for Malt as superintending civil engineer in the cor struction of the harbour works.

London Streets.—The conference of representatives of the metropolitan borough cour cils, convened by the Camberwell Boroug Council, makes the following recommendations:—London should be treated as a whol and improvements systematically selecte best calculated to provide relief to the mai thoroughfares, as advocated by a Select Committee of Parliament in 1871 and at onc formulated by the London County Couci in a definite and comprehensive scheme fc all future county improvements, and upo which London should equally contribut upon rateable value. In all thoroughfare in which tramways are or may be constructe a width of not less than 54ft. should be prc vided, and the total cost of widening borr by the London County Council either out c the tramways account or the county rate.

The Builders' Clerks' Benevolent Instit tion held its twenty-fifth annual festiva dinner at the Holborn Restaurant last wee under the chairmanship of Mr. Deputy Greer wood, the president. There was a compan of about four hundred. In proposing th toast of the evening, the president said th institution paid an annual "fee" to thos members who had been unfortunate enoug to fall on evil times; and sent the orphar of deceased members to the schools of oth institutions. Pensioners, men and womei received £30 and £24 respectively per annun and the wise course was taken of sendin the orphans to well-recognized schools. Th institution was founded in 1866, and th income for 1902 was £756. Up to the preser time it had distributed in pensions, &c., sum of over £10,000. The secretary announce a subscription list of £232, which included contribution of £25 from the president.

The Newcastle Masons' Strike. — Th members of the Newcastle and Tyne Distri Building Trade Employers' Association m last week to consider the situation create by the strike of 400 masons employed locall The employers had made certain demand for alterations in the working rules, and ha requested that the stonemasons should agr to the working day being extended by o hour. The men resisted these proposal The employers offered to withdraw the maj part of their demands—including that f the extension of the working day—if tl masons would grant them the extensio of a week after the date of expiratio of the notices in order that they mig obtain the sanction of the Northe Counties Federation, with which they (tl employers) were affiliated. The men d clined to grant any extension, and came o on strike against the employers' proposa The Federation has now been consulted, ar the masters had decided to withdraw the notices of desired alterations.

RCHITECTURE AT THE SCOTCH ACADEMY.

THE collection of architectural drawings in this year's Royal Scottish Academy : Edinburgh is entirely confined to the small :tagon. The centre piece of the apartment a model of the principal group in Sir owand Anderson's competition design for ie National Memorial to Queen Victoria in all Mall, a scheme further illustrated in vo water-colours. The frame of photo- raphs of Mr. Washington Browne's build- gs so well known as the Free Library, edfern's, &c., show a versatility of detail, oth exterior and interior, and a general high vel of excellence that has not been put out countenance by the subsequent work of e architect himself or his rivals. That of r. Lorimer, just elected an Associate, has so a varied selection ; notably, the Church the Good Shepherd and Briglands, in the d Scottish manner that Mr. Lorimer has ecially made his own. Mr. Kinross's frame views of dairy buildings at Manderston cludes a needed key plan. This is quite n unusual subject for such rich treatment, it, though money has been lavished, it has een well directed. The style is late Gothic, ith a suggestion of Roslin Chapel in the one carving. Mr. Flockhart's mansion at osehaugh is a particularly rich example French Renaissance. Three interior photo- aphs of Parkwood, Henley-on-Thames, are so in French Renaissance, though not quite pronounced. There is a fine canopy ick-and-stone chimney, heavy ceiling ists, and the walls apparently hung with ather. Mr. A. N. Paterson's frame is of ree views of Auchendennan on Loch omond. The style is revived Scottish venteenth century, and falls in with the isting fabric. Equally sumptuous is the Billiard-Room" designed by Mr. John A. ampbell, full of interesting and original etail ; while the same architect's "Duncryne ottage" is not inferior.

Though there are so many photographs en of the drawings that form the larger art of the exhibition, the majority delineate tual erections, and it is a pleasure to te, further, that geometric elevations are fered besides the too prevalent perspec- ve. A scale drawing of the "Scots- an" buildings (Messrs. Dunn & Findlay, chitects) shows a dignified design of type that specially distinguishes recent linburgh architecture, a phase of classic at makes much of rustication, and has as favourite feature the corner turret, always nploying sculpture and well-modelled rving. Messrs. Stephen & Pettigrew's well- nown gilded dome is also shown in geo- etric elevation, coloured ; apart from its iking decorative treatment, it is an ex- llent piece of work, especially when account taken of the restriction imposed by earlier ildings. Of Edinburgh street architecture block in Princes Street, by Mr. Hippolyte Blanc, and another in North Frederick reet by Messrs. Dunn & Findlay, are both propriately treated for frontages where ight exceeds breadth ; in each a couple of iels carried through several storeys are ade the most of ; in Mr. Blanc's there is as ell the high-pitched gable of the kind has frequently employed. The Glasgow rish Council Office, by Messrs. Thomson & ndilands, is a red stone building after e French Ecole des Beaux-Arts tradition : mething similar is the same architects' ringburn Hall competition design. hurches this year are unusually few. The skine United Free at Burntisland, by Mr. J. Wilson, is capably if not just excellently ndled, as the author's many examples nerally are ; a favourable point is that in- ead of a starved steeple a bell turret is given moderate dimension, and quite sufficiently rich. The east gable of Brechin Cathedral is the part recently restored ; the design of the old side windows is repeated here in the gable with a new feature, a circular light, over. The corner pinnacles strike one as being just a little fussy in outline. Mr. Honeyman has another exhibit, a "Sketch for a Cathedral" on orthodox enough lines, but rather uninteresting ; the central tower particularly is after a poor model. The altar in alabaster of St. Margaret's Convent, by Mr. Macpherson, has its place in a hexagonal apse of an earlier period than the furnishings, quite a favourite custom nowadays in the use of Gothic that has much to commend it. The Grainger memorial pulpit in Glasgow Cathedral nave (Mr. P. Macgregor Chalmer, architect) looks even better in actuality than here in pen and ink, as, apart from its own worth, it gives interest to the bare nave that is too much of a vestibule to the church proper. A Carnegie Library at Coatbridge (Mr. Alexander Cullen) is a classic building in the large manner characteristic of this architect's work ; it is illustrated by a good wash-drawing. Another library, one of the unsuccessful designs for Maryhill by Mr. Harry R. Taylor, has a façade very well treated. The Boroughmuir School (Mr. J. A. Carfrae architect) is less of the square factory type that unfortunately characterizes not a few Glasgow Board schools, but no plan is given to show by what arrangement the result is obtained. So far as the view goes, there is little in the Headquarters for the Volunteer Brigade of the Royal Scots, by Messrs. Cooper & Taylor, to convey a martial idea. The corner of a drill shed is, indeed, seen in the drawing, but beyond that one might take the administrative block for a modern country mansion. It is seventeenth-century Scottish domestic, quite good architecture, but not very expressive. The house at Peebles by Messrs. Simon & Crawford is much the best example of domestic work shown ; without either affected rusticity or architectural formality, it is a stone building with tiled roof, interesting, good in plan and elevation alike, without resort to oriels or many breaks in the wall-line, and the effects got by good detailing of door and window and chimney head, illustrated by geometric drawings lightly coloured. Two schemes of colour-decoration, a banqueting hall and a Kelvinside billiard-room, by Mr. Ednie, are excellently presented in facile brushwork. Mr. Leiper's sketch design for the decoration of the Glasgow Municipal Banqueting Hall is rather remarkable for an architect as it flagrantly disregards the structure of the apartment ; the main pilasters are cut in two, and the subordinate order shortened by the depth of its capital through the band of dark colour introduced. A rather highly coloured perpective of the Victoria Memorial for Allahabad, by Robert F. Sherar, is of that phase of French Gothic to which Burges gave currency ; it survives only in India, where it appears to have a vogue. A simple but most effective patriotic memorial for Hawick is shown by Mr. Birnie Rhine, sculptor. Besides a model, the Academy has admitted a few enamels. None are perhaps of first merit, but the case of unset pieces by Mr. Phœbe A. Traquair shows some very dainty work refined in sentiment, and the figures well drawn.—(Extracts from the "Glasgow Herald.")

A new Board School at Beccles has been erected by Messrs. Grimwood & Sons, of Ipswich, from plans by Mr. A. Pells, F.S.I.

Shrewsbury Abbey Church Tower is to be restored at an estimated cost of about £2,000. The Abbey was founded by Roger De Montgomery, and in pre-Reformation days was one of the most important religious foundations in England.

Bricks and Mortar.

Aphorism for the Week.

It is not by laying up in the memory the particular details of any of the great works of art that any man becomes a great artist, if he stops without making himself master of the general principles on which these works are conducted.—SIR JOSHUA REYNOLDS.

Our Plates. SOME particulars of Rowton House, Newington Butts, are given on p. 160 of this issue.—The drill hall in the village of Creswell, Derbyshire, is being erected for the Bolsover Colliery Co., Ltd., and is intended to serve the double purpose of a drill hall for boys and as a Sunday school. The accommodation includes a drill hall 66ft. by 35ft., with stage and dressing-rooms at rear, entrance hall 12ft. square, two cloakrooms and w.c.'s, tea-room and armoury on the ground floor, with recreation-room above provided with an open gallery front on to the drill hall ; basement and cellarage are also provided. Sand-faced bricks are being used for the exterior, with Ashover stone dressings, Cornish grey-green slates on the roof, and lead lights to windows. There is a ventilating turret, with clock below having skeleton dials. Inside the walls are plastered and coloured with "Duresco," and have glazed-brick dados. Flooring is of marble. Pitch-pine open-framed roof. Messrs. Houfton & Johnson, of Chesterfield, are the architects.

Flats. MR. DELISSA JOSEPH, F.R.I.B.A., replying to a letter which appeared in the "Times" about the lighting and air-space allowed to flats, says : "The flats to which your correspondent refers, as having living-rooms looking into small areas, were probably built before the London Building Act of 1894 came into force. That Act, for the first time, dealt specifically with flats which had come into vogue since the preceding Amendment Act of the Metropolitan Building Act of 1855 had been passed. The Act of 1894 prevents a living-room from looking into an area, unless the area is at least as long as half its height. It also requires all internal areas to have adequate means for the admission of fresh air at the base of the areas. Small areas are only tolerated when they light minor offices and corridors, and even then they must have provision for fresh air admission at the base. From this it will be seen that the special legislation for which your correspondent calls already exists, and that the evils to which he refers cannot recur under the present Act. I have designed many of the large blocks of flats now familiar to Londoners, and have found the provisions of the Act of 1894, in this regard, eminently practical and adequate." In further reply to the same correspondent, he says : "A minor office is a scullery, bathroom or larder, and does not include a kitchen. A kitchen is a living-room and a bedroom is a living-room. Where the windows of living-rooms are, for example, in the north and south ends only of an internal court, then, although the length of the court must, as already stated by me, be at least as long as half its height ; the act does not define the width unless living-room windows look also into the east and west flanks of the court, in which case the width is also at least as long as half the height. In the concrete case put by your correspondent, 'what is the least dimension that each side of a well must have in buildings 80ft. high,' these dimensions would be, assuming living-rooms looked into the well from the four sides, 40ft. long and 40ft. wide. I think I have now shown that under the Act of 1894 there is no prospect of kitchens or servants' bedrooms looking into inadequate or ill-ventilated areas, and that the provisions of the Act are satisfactory."

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Design for Drinking Fountain.

LLANARMON.—E. J. D. writes: "Please give me design and particulars of a drinking fountain with an arch above it, and the probable cost of same if built with stone."

This is asking too much of us. You should apply to a firm of monumental masons.

Stair-Building.

LONDON, N.W.—H. P. writes: "Kindly name a good book on the setting-out and construction of staircases."

"A Treatise on Stair-Building and Hand-Railing," by W. and A. Mowat (published by George Bell & Sons).

Richardsons's "Architecture."

LONDON, W.—A STUDENT writes: "I have recently come across a work entitled 'A Treatise on the Five Orders of Architecture,' in English and French, by George Richardson, dated 1787. Is it of any value either intrinsically or for study?"

The book is only worth 6s. or 7s. now, and is not much referred to for study.

Roof Carpentry and Bakers' Ovens.

AYRSHIRE.—FOOT RULE writes: "(1) Which is the best book on roof carpentry illustrating in detail all kinds of wood trusses? (2) Can you give me any information on the construction of bakers' ovens?"

(1) "Tredgold's Carpentry" (Crosby Lockwood & Co.), price £1 5s. (2) We know of no book on the subject. We advise you to apply to firms making a speciality of this kind of work.

Space per Person in Hall.

LLANELLY.—ASPIRANT writes: "(1) I have been asked to prepare plans for a small hall to seat 250 persons. What is the amount of space required for each person, and what floor area is requisite? (2) Where can I get a copy of the Model By-laws of the Local Government Board?"

(1) Allow 18in. length of seat for each person and a width of seat of 13in., and a width from back of one row of seats to back of next of 32in. at least. The floor-space, inclusive of passages, &c., for 250 would be about 1,200ft. super. (2) Messrs. Eyre & Spottiswoode, the King's Printers, East Harding Street, London, E.C.

Ascertaining the Proportions of Lime and Sand in Mortar.

STUDENT writes: "What is a simple but practical method of analysing mill-made mortar with a view to ascertaining whether the material contains the proportions of 1 of lime to 3 of sand or grit without earthy matter?"

A method of determining the proportions of lime and sand present in mortar, accurate enough for all purposes, is as follows:—Take a small quantity of the mortar and dry it by heat. Weigh it carefully, then put it in a glass dish and pour on a strong solution of hydrochloric acid, and leave for some time to allow it to dissolve all the lime. Then boil until dry, and pour on again plenty of water. Then pour on to a paper filter (to be bought at any chemist's) previously weighed; dry the filter with the contained residue, and weigh. This weight represents the earthy matter and grit, and the loss of weight found by deducting it from the weight of material before treatment is the amount of lime.

Roof-Truss to carry Top Floor.

HARROGATE.—DOUBTFUL writes in further reference to the reply given on p. 120 of our issue for April 8th. He gives details and figures which are not of general interest, but sufficient can be gained from the reply below.

By actual measurement the ground space occupied is as follows:—

	Cwt. per ft. super.
2½ cwt. sack of flour, 2·625ft. super.	= ·952
„ „ grain, 2·00 „	=1·250
2 cwt. „ coal, 1·58 „	=1·266

therefore 1¼ cwt. per ft. super. is the maximum possible with sacks of grain one tier deep, so that if the floor be safe with 2 cwt. per ft. super, it would permit a few sacks to be placed here and there upon the first tier.

HENRY ADAMS.

Treating Half-Timber Work.

CARLISLE.—CAREL writes: "I am erecting a golf pavilion at a seaside links. It is of half-timber rough-cast, with a brick base and Ruabon tiles on the roof. What is the best treatment for the external timber framing? The site is an exposed one; and I propose to stain the timber a dark oak colour, and give it two coats of boiled oil well rubbed in. I have been recommended to use Stockholm tar. What do you recommend?"

We do not see any advantage in treating the oak with any solution. If good seasoned English oak is used it will acquire a lovely silvery tone with age. As to your suggestions, both are equally efficacious in protecting the surface of the oak from the weather, but Stockholm tar looks ugly.

West Walton Church.

H. J. W. writes: "Kindly give some particulars of West Walton Church."

West Walton Church is dedicated to St. Mary. It appears that some of the family of Repps continued at West Walton from the time of the Conqueror till the year 1750. The church has a curious freestone tower standing about 22yds. south of the structure, which contains five bells. The church consists of a nave, north and south aisles, and a chancel, on the north side of which, a small distance from the pavement, lies a religious person, supposed to have been an abbott, under a tabernacle. The style of the church is Early English, and it is much ornamented by arcades enriched with the ornament of that period.

M.

Staining Oak Work.

WELLINGTON.—OAK writes: "(1) Will permanganate of potash, if used as a stain to darken oak, have any ill effect on the wood? (2) What do you consider the best stain for this work? The oak is used in choir benches in an old church. The benches in the body of the church are deal stained dark, and naturally the new oak is a great contrast. Do you think it advisable to stain the oak at all?"

(1) Permanganate of potash will not injure the structure of the oak, but will make it unsightly. (2) We do not advise the use of any stain, but if it is done at all oak is best darkened by fumigation with ammonia. The oak may look bright and new at first, but it is far better to let it acquire an even colour by age.

Building Construction Examinations.

GLASGOW.—QUERULOUS writes: "(1) In which of your issues were published the answers to the S.K. Building Construction Examinations (Advanced)? (2) Is there any small booklet issued with examination questions for a number of years back? (3) In Rivington's Advanced it says 'the consideration of bending moments is not included in this course.' Is this consideration now included? (4) I have heard it frequently stated that iron roofs are now to be considered in the Honours stage only. Is this so? (5) Do the R.I.B.A. allow the Preliminary Examination to be taken in two years? (6) When is the Kalendar to be issued?"

(1) Answers to the South Kensington Examination in Building Construction (Advanced) for 1901 appeared in our issue for June 19th, 1901, and for 1902 in our issue for May 14th, 1902. (2) We know of no book answering questions set in recent years, but for several years past answers have appeared in "Building World." (3) They are now included in the Advanced Stage. (4) Iron roofs came into the Honours Stage. (5 and 6) Write to the Secretary of the Institute, 9, Conduit Street, W. The syllabuses of the South Kensington examinations are to be found in Part II. of the Directory of the Science and Art Department, published by Messrs. Oliver & Boyd, of Edinburgh, or Messrs. Eyre & Spottiswoode in London.

Roman Vaulting.

TAUNTON.—CYMA writes: "The following question was asked in the Final Examination of the R.I.B.A. held in 1898: 'Draw to ¼in. scale one bay of an arcade not less than 16ft. wide, showing method of vaulting adopted by the Romans.' Kindly give a rough sketch of the above, or name of book that supplies the information."

See the article on "Voute" in Viollet-le-Duc's "Dictionnaire de l'Architecture Française" and that on "Construction" in Planat's "Encyclopedie de l'Architecture." Choisy is the great authority for Roman construction, and prepared numerous and most elaborate drawings which were published as steel engravings; they can be consulted at the large libraries.

Approval of Plans by an Urban Authority.

PEMBROKE.—COTTAGER writes: "When plans of houses are submitted to an urban authority, and they fail to either approve or disapprove them within a month, can they prevent or in any way take proceedings against anyone building according to these plans—(*a*) if plans are in accordance with by-laws; (*b*) if not strictly in accordance with by-laws? If the answers to the foregoing are in the negative, then where by-laws require only a fortnight's notice to be given of the intention to build, would this fortnight be the limit of time in which the authorities could reject, or would it be the month as given by the Public Health Act?"

The urban authority may take proceedings and call upon the building owner to show cause why such building should not comply with the requirements of the local by-laws. If the plans are in accordance with the by-laws, then the building owner apparently has nothing to fear as to the result; but if not, the result would, to a large extent, depend upon the points at issue, as no hard-and-fast rule can be laid down. In the case of *Masters* v. *Pontypool Local Board* it was held that if the local authority has not during the month prescribed by the Public Health Act of 1875, section 158 signified its disapproval of the plans submitted, it cannot afterwards object to the building according to the plan, nor can it under section 158 pull down a building without giving the building owner an opportunity of showing cause why it should not be pulled down. Also in the case of *Clark* v. *Bloomfield* it was there held that if a local authority did not approve or disapprove of the plans within a month, they could not pull down any work done in conformity with such plans, nor proceed for penalties for breach of any by-law. With regard to the further query, it is considered that the period of one month as laid down by the Public Health Act should be taken as providing the local authority a fair and reasonable limit of time to reject or otherwise express their decision with regard to the plans submitted.

T. E. C.

MODERN LONDON BUILDINGS.

(*Continued from* p. 135, *No.* 427.)

A list of public and semi-public buildings in the E.C. district was published in our issue for March 25th, of domestic and religious buildings, colleges and schools in the same district in the issue for April 1st, and of business premises in the same district in the issue for April 15th.

E.C. DISTRICT: BUSINESS PREMISES—*cont.*

BUILDING.	ARCHITECT.	APPROXIMATE COST.	REMARKS.
		£	
1878.			
Cold Storage Wharf Buildings, Cannon Street.	A. D. Dawnay, C E., and E. A. Gruning	—	The buildings cover an area of 27,000 sq. ft., and provide 500,000 cub. ft. of storage space.
1887.			
Sampson Low, Marston & Co's Premises, Fetter Lane, Fleet Street.	W. Leckham Witherington.	—	The premises have an 80ft. frontage and 70ft. depth. The elevation is of Portland stone and white brickwork. The building comprises offices and warehouses.
Six Warehouses on site of St. Paul's School, St. Paul's Churchyard	Delissa Joseph	—	These warehouses form the north wing and façade of the buildings on the site. The fronts are in glazed brickwork and Portland stone, with granite pilasters and bases to ground floor.
1888.			
British Equitable Assurance Co.'s Offices, 12 & 13 Queen Street Place, E.C.	A. S. Gover	—	The frontage is 72ft. and the depth 50ft. The two principal façades are in Portland stone, the ground-floor pilasters being of polished grey granite on a rusticated granite base. The general offices occupy the whole of the ground floor. The board-room on the first floor measures 48ft. by 25ft. 6in.
Offices for Mr. F. Mathieson, 32 Cornhill.	E. B. I'Anson & Son.	—	The lower portion of the façade is in red Aberdeen granite and the upper portion in Portland stone.
London and South-Western Bank, Fenchurch Street.	T. S. Edmeston	—	The Fenchurch Street frontage is 50ft. in length and that in Gracechurch Street 42ft., part of which is built as offices and shops. Portland stone, with granite up to window sills, were used for the fronts.
North China Insurance Co., 78 Cornhill.	William Kidner	—	The lower portion of the front is of grey Aberdeen granite, the superstructure being of Portland stone and red gauged brickwork. The carving was executed by Mr. Gilbert Seale.
Premises, 64 Finsbury Pavement.	W. H. Woodroffe	3,300	The front is of Portland stone and red granite, with projecting porch and bay window.
Premises, 145 Cannon Street.	Delissa Joseph	—	The elevation is in Portland stone, carved by Mr. Gilbert Seale.
Premises, 1 Amen Corner and 13 Warwick Lane.	George Pearson	—	The fronts are of red brick and Portland stone.
British and Foreign Marine Insurance Co.'s Offices, 31 Cornhill.	E. B. I'Anson & Son.	—	The ground floor is in polished red Aberdeen granite, whilst the upper portion is in Portland stone
1889.			
Commercial Bank of Scotland, new premises at corner of Lombard Street and Birchin Lane.	J. Macvicar Anderson.	—	The building is Classical in style. The walls from the level of the street up to and including the main cornice are built of brickwork faced with granite. The fronts on the ground and first floors, with the columns, are of light grey Aberdeen granite. Some of the columns are monoliths, weighing from 2 to 4½ tons each. The jambs of the entrance doorway each weigh 5 tons and the lintel 7 tons, the total weight of granite used in the building being 314 tons. The public office is lined with marble and has a marble mosaic floor.
Premises, corner of Holywell Lane and High Street, Shoreditch.	Drury & Lovejoy	—	The buildings comprise commodious basements and shop on ground floor, with showrooms on first and second floors. Above the second floor they are carried out in red brick with light terra-cotta dressings.
Premises, 137 Cheapside and 45 & 46 Gutter Lane.	Walter Greaves	—	The building contains in addition to the business premises a handsome restaurant on the top floor.
1890.			
Banking Premises, 43-47 Threadneedle Street and 2-4 Crown Court.	T. H. Smith	20,000	The front of the buildings up to the sill of the first-floor windows is in polished grey Aberdeen granite, the upper parts being in Portland stone.
Chesterfield House, 98 Great Tower Street.	Delissa Joseph	—	The basement of this building forms a restaurant, while the ground floor consists of shops; the first, second, third and fourth floors form commercial offices, and the fifth housekeeper's apartments. Constructional ironwork has been largely used throughout the building, and also wood-block paving. The ground-floor storey has been executed in grey and red granite, and the whole of the upper portions in Portland and Beer stones.
Garden House, Throgmorton Avenue.	Davis & Emanuel	—	This building occupies a frontage of 142ft. next Throgmorton Avenue, and a return frontage of 30ft. to Austin Friars. The entire fronts are faced with Portland stone. The sub-basement is built for strong-room purposes, and the floors above used as offices. A passenger-lift traverses the entire building. The floors generally are of fireproof construction.
Premises, 10 Fore Street	Delissa Joseph	—	Constructional ironwork is used extensively throughout. The elevation is of Portland stone, the ground-floor bases being of grey granite.
Premises for Messrs. Hudson Brothers, Ludgate Hill.	J. W. & R. F. Beaumont.	—	The lower portion of the building is of grey and red Aberdeen granite, and the upper portion is faced with Bracknell red bricks and Mansfield stone dressings. The first and second floors are let as offices, and the third-floor is occupied by Messrs. Hudson Brothers.
Stores for Messrs. Spiers & Pond, Water Lane, Queen Victoria Street.	H. A. Matear, Architect, and Sidney Hargreaves, Civil Engineer.	—	The buildings contain basement and sub-basement floors, with three floors above. The whole of the buildings both inside and out have been faced with glazed bricks. The exterior of the buildings is of Aberdeen granite up to 6ft. high and glazed bricks with coloured bands for the remainder. The cornices, sills, &c., are of Mansfield stone.
1891.			
Factory for Messrs. I & R. Morley, Golden Lane.	H. J. Treadwell	—	The building consists of eight floors including basement and sub-basement. The upper portions form sleeping accommodation for 120 porters, together with library and smoking room, all approached by a separate staircase from the business portion. The materials are brown Portland stone and red Bracknell bricks. The basement storeys are of granite and the ground storey entirely of stone.
Ludgate Hill Branch of the City and Midland Bank.	T. E. Collcutt	—	The ground-floor storey is in Aberdeen grey granite and the upper portion in terra-cotta. The carving and modelling is by Mr. Walter Smith.
Tower Buildings, Trinity Square.	T. R. Richards	—	These premises are used for business purposes, having five floors including the basement, and are built of red brick.
Warehouse for Messrs. Phillips & Co., corner of Mitre Street and King Street, Aldgate.	M. E. Collins	—	The materials used in the construction of these premises are red brick and Portland stone. The roof is an asphalted flat.
Eleven warehouses, Bradford Avenue, Red Cross Street.	C. J. C. Pawley		
1892.			
Bank premises for Messrs. Prescott, Dimsdale, Cave Tugwell & Co., Ltd., 50 Cornhill.	Henry Cowell Boyes.	25,000	The lower portion of the façade consists of a bold Aberdeen grey granite arcade, the upper part being of red brick with Portland stone dressings. Nearly the whole of the ground floor is occupied by the telling room, which is faced with English alabaster, with Spanish mahogany dado and cornice. On the first floor are the board-rooms, the secretary's offices, luncheon- and waiting-rooms. The upper floors contain the apartments of the residential staff. The basement and sub-basement contain the strong-rooms—nine in number. The roof is an asphalted flat.
Goods receiving office for Messrs. Pickford & Co., 34 Queen Street, Cheapside.	R. J. Worley		
Premises 18 to 23 Cheapside.	T. H. Smith	—	These premises have a frontage of 60ft. to Cheapside and a depth of 200ft. They comprise four large warehouses, each having basement and four floors over, with two additional floors to front block. The front is in Portland stone and the carving is by Mr. Gilbert Seale.
Shop front for the directors of Sir John Bennett, Ltd., 65 Cheapside	A. Burnell Burnell	—	The front elevation of this building has been renewed, the old frontage being reduced by half.
"Token House" for Messrs. Mathieson & Sons, printers, 16-18 Copthall Avenue.	J. Barnes Williams	—	The lower portion of the front is built of Cornish granite and the upper portion of Portland whitbed stone.

E.C. DISTRICT: BUSINESS PREMISES—*cont.*

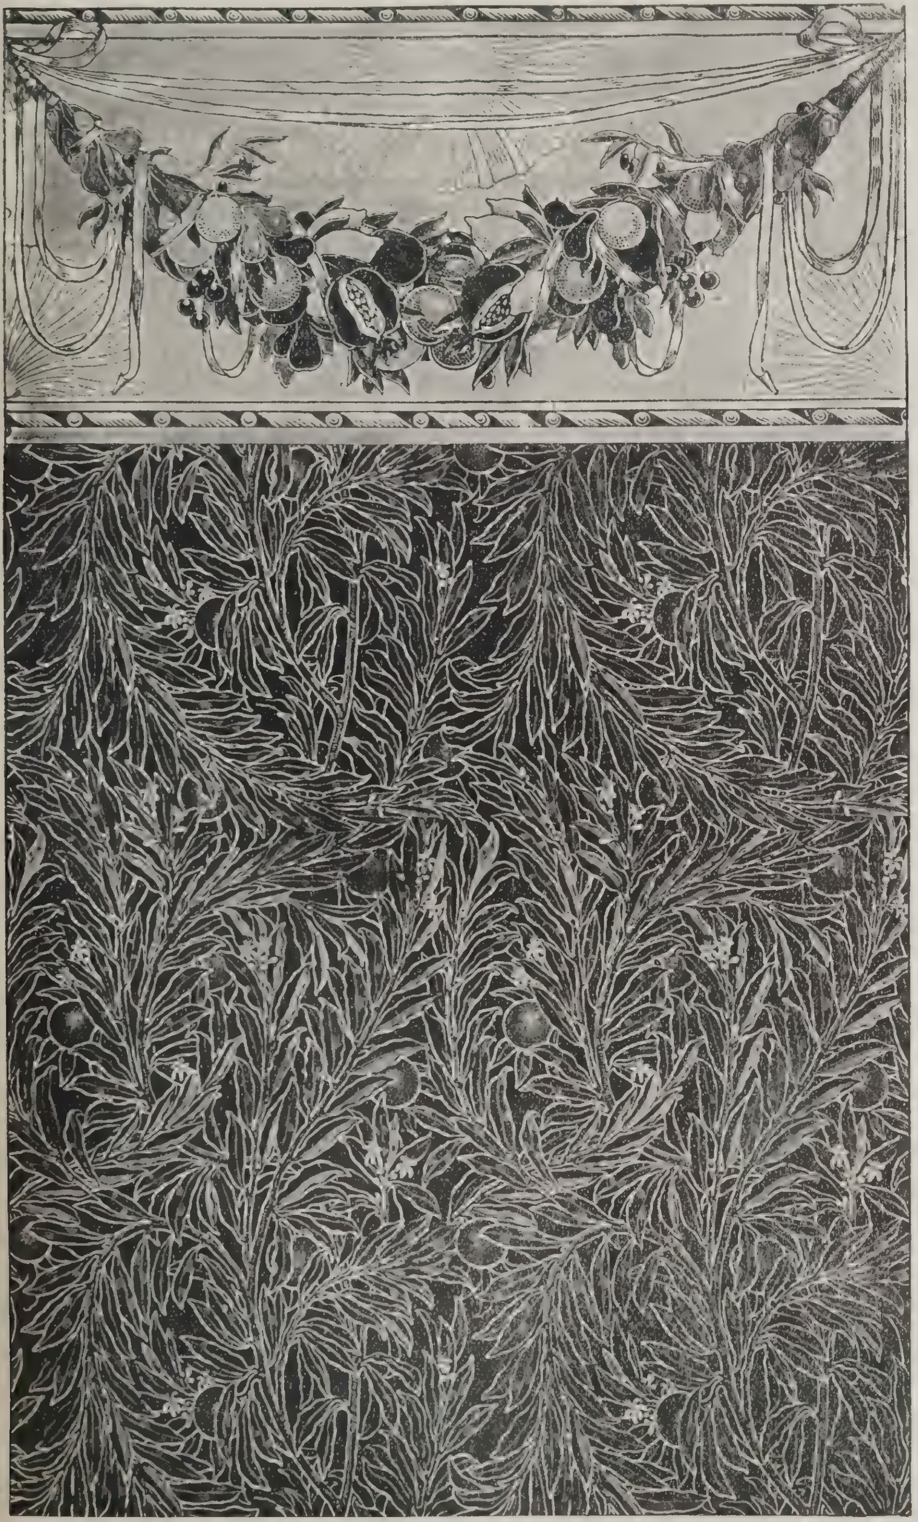
Building.	Architect.	Approximate Cost.	Remarks.
1893.			
Premises for Messrs. William Dawson & Sons, Ltd, Cannon House, Bream's Buildings, Fetter Lane.	W. Seckham Witherington.	—	The third storey, which has a fireproof floor, is occupied by the Birkbeck Institution which adjoins, and is specially arranged as an art studio and life classroom. The stone used in the elevation is Portland, and the bricks are red Pluckley. The carving is by Mr. Gilbert Seale.
Banking and office premises, 6 Old Jewry.	Delissa Joseph		The ground floor portion of the elevation is in grey granite and the remainder in Portland stone. The interior and exterior joinery throughout is executed in mahogany.
Finsbury Circus Buildings, 18 Eldon Street.	Delissa Joseph	—	The ground floor in Eldon Street is occupied by shops. The building contains, in some parts, seven storeys consisting of offices, comprising 116 rooms. The elevation is in Portland stone, executed by Mr. F. J. Barnes.
Office premises, 18 Bishopsgate Street Within.	W. E & F. Brown	—	This building is designed to form suites of offices. The ground floor is in polished Cornish granite, and the rest of the front is in terra-cotta, modelled by Mr. R. A Ledward.
St. Dunstan's House, St Dunstan's Hill.	J. T. Wimperis & Arber		This building forms a large block of City offices. The portion facing Lower Thames Street is designed as a restaurant and hotel.
St. Olave's Chambers, Old Jewry.	Delissa Joseph	—	This block of offices occupies nearly the whole of the site formerly occupied by St. Olave's Church. The elevation is in Portland and Bath stones.
Warehouse for Messrs. Pratt & Sons, Peter's Lane, Smithfield.	Lewis Solomon	3,500	This building has a 56ft. frontage.
Warehouses 18, 19, 20 & 21 Warwick Square.	Delissa Joseph	—	This range of warehouses is constructed of red brickwork and Portland stone, the ground floor having shop fronts facing the street.
1894.			
The Metropolitan Life Assurance Society's Building, 13 Moorgate Street.	Aston Webb & E. Ingress Bell.	— —	On the ground floor is the main office, the actuary and assistant-actuary's rooms and the committee-room. On the first floor are a board-room, doctor's- and dressing-room, waiting-room and directors' luncheon-room. The walls of the ground floor and board-room are panelled with Spanish mahogany. Portland stone is used for the fronts with polished Cornish granite for the plinth. The sculpture is by Mr. W. S. Frith.
Peninsular and Oriental Steam Navigation Co.'s offices, 122 Leadenhall St (additional building).	T. E. Collcutt	—	The front is faced with Portland stone, relieved with Corsehill stone bands and columns. The sculpture was executed by Mr. Henry Pegram. The lower panels contain water colour drawings in bronze frames, by Mr. Frank Murray.
Premises 141 & 142 Fenchurch Street.	Ebenezer Gregg	7,500	This building has a ground-floor front of Portland stone and the upper storeys of red brick and buff terra-cotta. The front portion of the ground floor and basement form shop premises, whilst the rear and all the floors above are designed as offices.
"West India House," 96 Leadenhall Street.	Delissa Joseph	24,000	This building, which covers an area of 7,000ft., contains over 100 rooms and comprises seven storeys. The elevation is carried out in Portland stone and grey granite.
Temple House, premises for Messrs. Horace Marshall & Son, Temple Avenue.	Frederick Boreham	—	The style chosen is Italian and the materials are red brick and Portland stone. The frontages are 100ft. to Temple Avenue and 80ft. to Tallis Street. The basement and ground floor are devoted to the general requirements of the business, the clerks' offices and stock-rooms being on the upper floors. On each of these floors and fronting Temple Avenue are suites of offices for the use of editors connected with the publications of the firm, and also offices for the principals.
Bishopsgate House, Bishopsgate Street.	T. H. Smith		
Dominion House, 110 Fenchurch Street.	Delissa Joseph	18,000	This range of merchants' offices covers an area of 6,400ft., the frontage to Fenchurch Street being 46ft., carried out in Portland and Westwood stones. The basement is arranged as fireproof wine cellars.
Ocean Accident and Guarantee Corporation, Ltd., Offices, Moorgate Court.	H. Huntly-Gordon	—	The building is built of red bricks and grey terra-cotta. It contains over 100 offices and has two basements. The construction is fireproof, being of concrete and steel..
Offices for H. Huntly-Gordon, 123 Cannon Street.	H. Huntly-Gordon	—	The front is built in red rubber brickwork and grey terra-cotta.
Offices for Messrs. Edward Lloyd. Ltd, 12 Salisbury Square.	H. L. Florence	—	The elevation is of red bricks, with dressings and bands of red Mansfield stone, bronze tablets being placed over the ground-floor windows. The floors are fireproof and the internal woodwork is oak.
1896.			
Bank of Scotland, Prince's Street	William W. Gwyther.	—	The exterior of the building, which is designed on Italian lines, freely treated, is of Portland stone, the portion of the front up to the bank windows being rusticated and rock-faced. The entrance arch and vestibule are in polished Norwegian porphyry. In the spandrels are figures executed by Mr. E. Roscoe Mullins. On the ground floor is the banking hall, a chamber 60ft. by 50ft. by 20ft. high. The ceiling is divided by moulded and enriched cornices and the walls are lined with green tiles and a dado of Numidian marble. The manager's- and committee-rooms are on this floor, the upper floors containing separate offices.
Birkbeck Bank, Southampton Buildings (completed 1902).	T. E. Knightley	—	A spacious entrance at the angle of the building gives access to the large circular banking-hall, which is 75ft. in diameter and is surmounted by a dome, grouped round which are suites of offices. The brickwork is in London stocks and Fletton bricks in cement. The facings in the open areas are of white-glazed bricks, and the arches and sills of all openings are of buff terra cotta; at other places where bricks are employed on the face they are of white gault. The construction throughout is fireproof. The style adopted was Italian Renaissance.
Commercial Union Assurance Company's Offices, Cornhill and Change Alley.	J. Macvicar Anderson	—	The building contains nine floors in the Cornhill block and seven in the Change Alley block. There are two basements in white-glazed brickwork, occupied by strong-rooms, engine-rooms, lavatories, &c. On the ground floor of the Cornhill block are the home, fire, marine and the fire-accountants' departments, and the managers' and underwriters' rooms. On the first floor are the Life Office, with actuary's and doctor's rooms, the adjuster's and the marine accountant's offices. The second floor is occupied by the board-room, 42ft. by 20ft., the directors' luncheon-room, committee- and waiting-rooms and the secretarial department. On the third floor are the county fire and the fire guarantee departments. On the fourth floor the foreign fire office occupies a room 85ft. by 22ft., with plan-room and typists'-room. On the fifth floor are the clerks' luncheon-room, kitchen and offices attached, housekeeper's-room and servants' hall, &c.; and the sixth floor is devoted to bedrooms for servants. The Cornhill front is executed in Portland stone, and the fronts in Change Alley are in polished granite and white-glazed bricks. The building is fireproof throughout.
24 and 25 King William Street.	Gerald C. Horsley	—	This building contains five floors of offices with basement, and housekeeper's rooms in the roof. The materials used were red brick and stone with red-tiled roof.
Temperance Permanent Building Society's Offices, 4 Ludgate Hill.	Rowland Plumbe	—	The building comprises a basement and five floors. Upon the ground are the public office, two private offices, &c. The basement contains a large office in front, and in the rear a series of strong-rooms, a boiler room and lavatory. The board-room is on the first floor. The front elevation presents a bold design in the German Renaissance style, the materials used being Portland stone and red Dumfries stone.
Shop Premises for Sir T. J. Lipton, City Road.	Messrs. King	—	The premises are built of white stone and red brick.
Forty warehouses on site of Old Farringdon Market.	P. B. Tubbs	—	The buildings are faced with Portland stone
1897.			
Bush Lane House, Bush Lane, Cannon Street.	Delissa Joseph	18,000	This block of professional and commercial offices occupies a ground area of 6,000ft. The building has a frontage of 115ft., and the elevation is in red brickwork, with Portland stone cornices, caps, bases and sills. The large entrance feature is also of Portland stone. The building comprises lower ground and upper ground floors, with four floors above, and contains ninety-six rooms on the various floors, which are served by a stone staircase and a passenger lift. The construction is entirely fireproof, and the lighting throughout by electricity.
National Press Agency, 6 Carmelite Street.	Edwin T. Hall	—	This building is constructed of brickwork in cement and faced with red bricks, all the dressings being of brown terra-cotta. The building is of fire-resisting construction throughout.
Phillips & Tribe's Premises, 4 Hosier Lane.	Thomas Wallis	3,370	
Spence & Co.'s Premises, 76, 77 and 78 St. Paul's Churchyard.	Banister Fletcher & Sons.	15,000	The building consists of a basement, ground floor and four upper floors. The front, which is Elizabethan in style, is faced with Portland stone, and the ground floor contains four bay shop-windows. The basement contains packing and order rooms. The ground and first floors contain showrooms. The counting-house and offices are on the second floor, while the third floor contains dining-rooms and a serving-room. On the fourth floor are bedrooms, housekeeper's apartments, kitchen, bathroom, lavatories, &c. The floors are of steel and concrete construction and the roofs are covered with green slates.
1898.			
Barclay & Co.'s Bank (on former site of Messrs. Goslings' Bank), 19 Fleet Street.	Arthur Blomfield & Sons	—	The banking chamber occupies the full width of the site (except for an entrance and staircase for access to the upper floors), the rear portion of the site being occupied by the partners' rooms. The first floor contains a large suite of offices, while the two upper floors are occupied by the bank. The front is entirely of Portland stone.
London Joint Stock Bank, 113 Wood Street.	Davis & Emanuel	—	The site of the building occupies about 3,600ft. super. The bank occupies about two-thirds of the ground floor and about half the basement for its own purposes. The remainder of the building is designed to form offices. The front to Wood Street is a free treatment of Italian Renaissance, in Portland stone, with Swedish red granite dressings to the entrance doorway of the bank.

(To be continued.)

WALLPAPER DESIGN.

WE may regard modern wallpaper design as most satisfactory, for the dead formalities of mid-Victorian art have long since been replaced by living motives treated with great breadth of effect and admirable colour. Many of those who were initiative in this creation of true wallpaper design—for it must not be forgotten that wallpaper is essentially a modern product—are now dead, but among living designers Mr. Walter Crane may fittingly be given a premier place. We may not admire his oil paintings, but as a designer he is paramount. The "Orange Tree" paper with "Fruit" frieze, specially designed for Messrs. Jeffrey & Co., the well-known wallpaper manufacturers, is a worthy example of Mr. Crane's work: the reproduction below shows the design well, but of course lacks the colour which makes it so charming, as one might have seen at the Arts and Crafts exhibition or at Messrs. Jeffrey's new showrooms at 31, Mortimer Street, Regent Street, W. The firm has introduced several new designs this year, such as the "Umballa," the "Salute," the "Josephine," the "Antoinette" (embossed in low relief), the "Bellagio," the "Manse," the "Stamboul" and the "Crouch."

Another of Messrs. Jeffrey's specialities is the "Stamford" decoration, which consists of a plain frieze, a filling, and pilasters which may be put just where they are needed to suit any pictures. The "Loanda" decoration is another of the firm's specialities, being a frieze printed on the filling. These papers may be had in the most beautiful colours—the filling for the "Stamford" decoration especially.



THE "ORANGE TREE" PAPER AND "FRUIT" FRIEZE. BY WALTER CRANE.

Law Cases.

Two Workmen's Compensation Cases.—The two cases of *Elvin* v. *Woodward & Co.* and *Atkinson* v. *Lumb* were heard in the Court of Appeal last week. In the former case the applicant for compensation was a painter in the employment of Woodward & Co., who had contracted to repair and paint No. 46, Finsbury Square, E.C., which exceeded 30ft. in height. The applicant was painting a wall, and was standing upon a pair of ordinary painter's steps, 8ft. high, with a board on the top. The steps slipped and Elvin was injured. At the time of the accident the main scaffolding which had been used in repairing the house had been taken down. The county-court judge was of opinion that the steps afforded no evidence that the house was being repaired by means of a scaffolding, and an award was given for the respondents. The applicant appealed.—The Court allowed the appeal.—The Master of the Rolls said that at one time he would have held without any hesitation that such steps as these were not, and could not be, a "scaffolding" within the meaning of section 7, sub-section 1, of the Workmen's Compensation Act, 1897. The House of Lords, however, had in *Hoddinott* v. *Newton, Chambers & Co.* held that scaffolding might be external or internal, and might include an internal staging arranged with planks and trestles and without poles. It was exceedingly difficult to find any principle of law to apply in ascertaining what was a scaffolding. In *Marshall* v. *Rudeforth* the Court of Appeal had held that it was impossible to say as a matter of law that a ladder placed against a house and used for repairing the house must be a scaffolding. On the other hand, the Court held in *Veazey* v. *Chattle* that a crawling-board used for the repair of the roof of a building might be a scaffolding. The question in the present case was whether a pair of ordinary painter's steps could be a scaffolding within the meaning of the Act. He based his judgment on this, that these steps might be a scaffolding. He could not draw any distinction in point of law between a staging consisting of planks placed across trestles or footstools and ordinary painter's steps which carried their own support with a top wide enough to form a platform for a man to stand upon at work. He could not say as a matter of law that such an arrangement could not be a scaffolding. That being so, there was evidence upon which the county-court judge might find that the steps were a scaffolding, and therefore the appeal must be allowed and an award made in favour of the applicant for £1 a week from fourteen days after the accident.—Lord Justice Stirling felt bound to come to the conclusion that the view taken by the county-court judge was correct.—Lord Justice Mathew agreed with the judgment delivered by the Master of the Rolls.—The respondents will appeal to the House of Lords.—In the second case of *Atkinson* v. *Lumb* the workman injured was in the employment of a contractor who was constructing a reservoir and laying down pipes for the supply of water to a town. It was admitted that the construction involved the use of machinery driven by steam power, and that therefore it came within "engineering work" in section 7, sub-section 2, of the Act of 1897. The reservoir was about two miles from Todmorden. The accident happened about 500yds. from the reservoir in the course of laying some pipes, and the question was whether the applicant was employed "on or in or about engineering work." The county-court judge found that the place where the accident happened was part of the area of the engineering work.—The Master of the Rolls supported that finding, and the Lord Justices were of the same opinion.—Appeal dismissed.

Complete List of Contracts Open.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED
		BUILDING:		
April	30	Abergavenny—Pair of Cottages	R. Lewis	B. J. Francis, Architect, Abergavenny.

Isca Foundry Co., Newport, Mon.	3,369	4	6
A. G. Cloake, London, E C.	3,219	0	0

* Accepted.

Bournemouth.—For the erection of a new cricket and football pavilion at King's Park, for the Bournemouth Town Council. Mr. W. F. Lacey, M.I.C.E., borough engineer and surveyor:—

E. S. Griffin, Broadstone, Wimborne	£2,411
W. Hoare, Bournemouth	2,119
J. McWilliam & Son, Bournemouth	1,998
Jenkins & Sons,* Ltd., Bournemouth	1,953

* Accepted.

Bridgwater.—For the erection of new sorting office at Bridgwater, for H.M. Office of Works, &c.:—

				A
H. A. Forse & Sons	£3,064	0	0	£5
C. Bryer, junior	2,139	0	0	45
T. Stockham	2,079	0	0	12
H. W. Pollard*	1,732	5	7	30
F. Scott	1,680	18	6	10
Westbury & Jarman	1,489	17	6	15

* Accepted. A. Credit old materials.

Cowbridge (Glamorgan)—For the construction of a new road from Lanharry Common to Lanharran, for the Cowbridge Rural District Council. Mr. G. E. Morris, A.M.I.C.E., surveyor, Llanbethian, Cowbridge:—

Barnes, Chaplin & Co.. Cardiff	£2,725
W. Cooksley, Miskin, Pontyclun	2,643
W. David, Brynna	2,463
Jones & Sen, Coychurch	2,284
W. Raikes, Coychurch	2,036
Osmond Brothers, Ely	2,036
T. Rees, Ely	1,975
E. H. Page, Cardiff	1,951
J. E. Evans,* Cardiff	1,685

* Accepted.

Jarrow.—For excavating and forming macadam and paved roads and concrete footpaths for Howard Street, Randolph Street, Percy Street, and the following back streets:—Back Monton Terrace, Back Dee Street North, Back St. Paul's Road; back streets between Salem Street and Harold Street, between Cobden Street and Howard Street, between Russell Street and Wilberforce Street, between Derby Street and Percy Street, between Percy Street and Raglan Street, and Back Hope Street, for the Corporation. Mr. J. Petree, borough surveyor:—

W. Kennedy, Jarrow	£2,331	10	5
G. Wells, South Shields	2,081	6	3
G. Thornton & Co., South Shields	1,868	13	7
T. Callaghan,* 40, Staple Road, Jarrow-on-Tyne	1,624	18	6

* Accepted.

Hazel Grove (Stockport).—For the erection of new club premises, Napier Street, Hazel Grove, for the Hazel Grove and District Reform Club:—

G. Oldham, Hazel Grove	£1,105	0	0
Vernon & Smith, Hazel Grove	1,098	10	0
W. B. Beattie, Stockport	1,080	0	0
S. Daniels,* Buxton Road, Hazel Grove, near Stockport	1,071	0	0

* Accepted.

Hebburn.—For the making of certain streets in Hebburn, for the Urban District Council. Mr. Curry, surveyor:—

Wardlaw, South Shields	£3,720	13	2
Thornton, South Shields	3,399	15	5
Spur, Whitley Hay	3,315	10	5
Fisher, Gateshead	3,017	2	0
Robson, Newcastle	2,936	13	6
Brown, Gateshead	2,901	7	6
G. Simpson,* Newcastle	2,686	19	3

* Accepted. [Surveyor's estimate, £3,510.]

Leavesden (Herts).—For the erection of a home for female attendants at the Leavesden Asylum, for the Metropolitan Asylums Board:—

S. Maynard & Son, Aylesbury	£7,600	18	10
G. Munday & Sons, Tower Hill, E.C.	7,549	17	2

Thomas & Edge, Woolwich, S.E.	6,326	0
A. E. Symes,* Carpenters Road, Stratford, E.	6,298	0

* Accepted.

London, S.E.—For the erection of a new police station at North Woolwich. Mr. J. Dixon Butler, surveyor to the Metropolitan Police. Quantities by Messrs. Thurgood, Son & Chidgey, Charing Cross Chambers, Duke Street, Adelphi:—

Wells & Son	£9,475	Perry & Co.	£8,700
Lascelles & Co.	8,972	Grover & Sons	8,647
Lawrence & Sons	8,948	Lathey Brothers	8,545
Williams	8,942	Chessum & Sons	8,499
Hood	8,919	Lorden & Son	8,388
F. & H. F. Higgs	8,886	Richardson	8,032
Holloway Brothers	8,779		

London, N.—For the making and completing of roads, paths, &c., at the Infirmary, Highgate Hill, Upper Holloway, N., for the Guardians of St. Mary, Islington. Mr. W. Smith, 65, Chancery Lane, W.C.:—

Ballard, N W.	£6,276	0	0
Goddard & Co , Caledonian Road	4,912	5	4
Adams, Green Lanes	4,336	17	9
Dunmore	4,263	0	0
Jackson, Finsbury Park	4,180	0	0
International Asphalt Co.	4,047	0	0

London, S.W.—For the erection of stables at Chelsea, for Mr. H. Covington. Mr. T. Wilson, architect, 34, New Bridge Street, E.C:—

Patman & Fotheringham	£3,650
L. Whitehead & Co.	3,615
C. Wall	3,590
H. Wall & Co	3,439
Gould & Brand	3,420
Nightingale	3,396
J. Chessum & Sons	3,320

London, S.W.—For shop front and fittings for Dairy at Frognal Parade, Hampstead, N.W. (exclusive of marble and granite work), for Messrs. J. Richards Ltd. Mr. T. Wilson, architect, 34, New Bridge Street, E.C.:—

Williams	£402
H. Wall & Co.	367
J. Pugh*	355

* Accepted.

Radyr (near Cardiff).—For the erection of a church at Radyr, near Cardiff, for the Rev. D. Phillips, M.A., rector, and Committee. Mr. G. E. Halliday, F.R.I.B.A., architect, Cardiff:—

Lattey & Co., Cardiff	£2,602	12	0
W. Cox, Llandaff	2,365	15	2
C. C. Dunn, Cardiff	2,132	0	0
Couzens & Co., Cardiff	2,045	10	0
Williams & Hoare, Roath	1,979	0	0
Beames & Nephew, Roath	1,922	0	0
Knox & Wells, Roath	1,879	0	0
A. W. Cadwallader,* Fairoak Road, Roath	1,685	0	0

* Accepted.

Ridge.—For rebuilding the "Old Guinea" for Benskin's Watford Brewery Co., Ltd. Mr. Percival C. Blow, A.R.I.B.A., architect, 7 London Road, St. Albans:—

W. Sharp, St. Albans	£1,097
Miskin & Son, St. Albans	970
J. T. Bushell	938
Boff Brothers,* Park Street	905

* Amended and accepted.

St. Albans.—For the erection of a residence, Spencer Park, for Mr. H. W. Edwards. Mr. Percival C. Blow, A.R.I.B.A., architect, 7 London Road, St. Albans:—

W. Sharp, St, Albans	£1,154	10	0
F. Stanley, St. Albans	1,150	0	0
W. Vail & Co., St. Albans	1,143	15	0
Whibley & Jervis	1,140	0	0
J. T. Bushell, St. Albans	1,128	16	5

New Companies.

PATENT STONE-DRESSING TOOL CO., LTD., 51, Wickerane, Sheffield. Capital: £8,000 in £1 shares.

ANTO-GAS PLANT CO., LTD., engineers, contractors, &c. Capital: £2,000 in £1 shares.

CHARLES WATERHOUSE & CO., LTD., stone merchants' &c., New Dock Basin. Chadwick Street, Hunslet, Leeds. Capital: £5,000 in £1 shares.

PEARSON'S ANTISEPTIC CO., LTD., dealers in disinfectants and sanitary compounds, &c. Capital: £1,000 in £1 shares.

STONEYCOMBE LIME AND STONE CO., LTD., quarry proprietors, lime and stone merchants, Ipplepen and Chudleigh, Devon. Capital: £2,000 in £1 shares.

MESSRS. ASHBURNER, LTD., lime burners, builders and contractors, &c., Market Street, Dalton-in-Furness. Capital: £5,000 in £10 shares.

A FEW PRESS OPINIONS OF

Specification, No. 6

The Standard Technical Authority.

"The Journal of the Royal Institute of British Architects," April 4, 1903.

"The volumes contain a vast amount of information of special interest to the architect, surveyor and engineer. 'Specification No. 6 (1903)' is conspicuous in this respect, and the ease with which one can refer to any particular subject points to the excellence of the system of classification adopted. 'Specification' must by now be so well established as to render a recommendation that it find a place in every architect's office, belated advice."

"The Architects' Magazine" (the Journal of the Society of Architects), March 1903:

"'Specification' this year appears in a much enlarged and improved form, . . . and will, we feel sure, be welcomed by the student and practised architect alike."

"Architectural Association Notes," March 1903:

"Contains . . . most useful information for architects, engineers, and surveyors, however wise they may already be. It is a book of reference well worth having."

"Irish Builder," February 12, 1903:

"'Specification' is a work of the greatest possible utility to the architect or engineer. It is well arranged, complete and comprehensive, while the information is thoroughly revised and up-to-date."

"The Iron and Steel Trades' Journal," March 28, 1903:

"The contributors to the volume are all men of high repute, and a wealth of information carefully tabulated is immediately at the service of the reader. It should find a place in the office or study of all interested in building and general engineering."

"The Electrical Review," March 27, 1903:

"Since each article is accompanied by plans of actual buildings, and is contributed by an expert in that particular line, no one can study the book without becoming interested, as well as gaining a great deal of useful information. . . . The book is valuable as a reference to both consulting and contracting engineers."

"The Quarry," April 1, 1903:

"As a reference book for the architect and surveyor, this volume should prove of great service, while the engineer also will find in its pages much that is of value. The matter is well arranged and fully illustrated, while the clearness of printing leaves nothing to be desired.',

"The Sanitary Record and Journal of Sanitary and Municipal Engineering," February 26, 1903:

"Good as former numbers have been, this one, in my opinion, excels all its predecessors, especially in matters interesting to municipal engineers."

"Plumber and Decorator," April 1, 1903:

"'Specification' is replete with valuable information for all interested in building. Division III. will be found invaluable for reference when specifying. The 700 pages of the new edition provide a mine of intellectual reading and valuable information."

"The Ironmonger," March 28, 1903:

"The reappearance of this annual contribution to the literature of the building arts and crafts affords an opportunity of calling attention to its usefulness to the Builders' Merchant and Ironmonger. . . . The illustrations are well done and the general get-up of the book is capital."

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

May 6, 1903. Vol. 17, No. 430.

9, East Harding Street, E.C.

The "Alhambra" Rumour. It is rumoured that there is much more than a possibility the London County Council will purchase the "Alhambra" and the buildings on either side as a site for its county hall. That would indeed be a splendid achievement after losing the magnificent site at the bottom of the new street to Holborn—a more notable achievement perhaps than the suggested demolition of the Adelphi houses! To the left of the county hall, on the Leicester Square front, would be the new dental hospital, to the right some other styles of architecture in the form of a gilded hotel and the "Empire," while *vis-à-vis* would be the dejected garden with Will of Avon standing sideways and a little fish spouting water on either hand. The Council are badly in need of a civic building where they can collect their scattered forces, but we have not as yet recovered from their recent gross mistakes to have any sympathy even with such a brilliant scheme as the purchase of the "Alhambra" for perhaps three-quarters of a million!

Liverpool Baths Competition. Liverpool is gaining rather an unfortunate reputation for architectural competitions. A fortnight ago we reviewed the competition for baths and tramway offices to be erected on the site of St. George's Dock. Now we have to announce that the scheme is abandoned. The Baths Committee and the Tramways Committee will each submit their own scheme, and we notice that this may be for the dock site "or elsewhere." Possibly it may be thought that the payment of the premiums settles everything in the best possible way; but we hardly think the fourteen unsuccessful competitors will feel equally satisfied. We have already expressed our opinion that the competition was disappointing and that none of the designs exhibited that grasp of the requirements which would lead to wholly convenient buildings being erected therefrom; but we repeat that this was very largely due to the stipulation that the intended Dock Board Offices adjacent should be the keynote for the external treatment of the Corporation building, and the inclusion of too many buildings within the site. The Committees evidently think they can do better themselves. But their action in thus abandoning the scheme will not improve the status of architectural competitions, nor endear the hearts of architects to those held in Liverpool.

Lady Mosaicists. Up among the arches of the great new cathedral at Westminster a "twittering" may be heard, which, on investigation, is found to proceed from a score of young ladies enveloped in overalls. These are the workers on Mr. George Bridge's mosaics—in the chapels of All Souls and of St. Gregory and St. Augustine on either side of the vast nave. Mr. Bridge finds that the young ladies suit his needs admirably, but it must not be supposed that they are there without training. "I have ladies come to me sometimes," says Mr. Bridge, "who think they can set to work at once and earn two or three pounds a week. But that is, of course, absurd. There is a great deal of technique to be mastered, and I estimate that a fairly clever worker needs two years' experience before being put on figure work"—these young ladies have been through the schools and drawn from the "life," so that they are able to handle the mosaic in an intelligent manner. Mr. Bridge's first pupil was his wife, who succeeded so well that he decided to engage other female workers; until we find him here in the cathedral directing quite a school of them. The practice of architecture as a profession for women receives periodical attention but, with a few exceptions, never becomes a reality. For ourselves we do not think it ever will while contractors are men, not always gifted with the tongues of angels: but there is surely a field for women in some of the applied arts connected with architecture where, indeed, the subtler touch of the female hand and the more delicate gauge of the female eye may prove a boon—a possibility to which Mr. Bridge's practical experience gives much hope.

Mural Tablets. In the majority of cases a well-designed mural tablet or medallion is a far more satisfactory means of commemorating anyone than a statue or bust, because, as a rule, there is no proper provision made for the latter, and consequently they look out of place. It is hardly necessary to repeat Ruskin's epithets about the interior of Westminster Abbey; the circumstances in that revered pile are unique, and we should not suppose that the mistake would be made again in any modern cathedral. But the mural tablet, too, can mar the interior of a church. Who does not know those staring marble erections spread profusely between the aisle windows, crossing piers and pilasters and generally spoiling the proportion and lines of the building; not only in churches belonging to past centuries, but in new churches of importance. It would be a great improvement if all such tablets were removed, or replaced by others in keeping with their position.

Dreams of Architecture. Highly-strung natures and imaginative persons must necessarily be subject to dream dreams, and as architecture, in spite of prosaic by-laws, draws on the creative faculty, we may be sure that many men have had strange fantasies of great buildings. But very few will be so grandly mystic as Piranesi's "Dreams," which series of plates he published as a record of his visions during the delirium of a fever. Coleridge once described them to De Quincey, and the impression so reacted on the latter's mind that he too dreamt dreams of architecture in the early stage of his opium-eating malady; in which dreams he saw such pomp of cities and palaces "as was never yet beheld by the waking eye"—fabrics of diamond and of gold, with alabaster domes and silver spires, blazing terrace upon terrace, serene pavilions bright in avenues disposed, and towers begirt with battlements that on their restless fronts bore stars. Some of Piranesi's plates represented vast halls on the floor of which stood all sorts of engines and machinery, wheels, cables, pulleys, levers, catapults, &c., expressive of enormous power put forth and resistance overcome. Then, says De Quincey, creeping along the sides of the walls you perceived a staircase; and upon it, groping his way upwards, was Piranesi himself: "follow the stairs a little further, and you perceive it come to a sudden and abrupt termination, without any balustrade, and allowing no step onwards to him who had reached the extremity, except into the depths below. Whatever is to become of poor Piranesi—you suppose, at least, that his labours must in some way terminate here. But raise your eyes, and behold a second flight of stairs still higher, on which again Piranesi is perceived, but this time standing on the very brink of the abyss. Again elevate your eye, and a still more aërial flight of stairs is beheld, and again is poor Piranesi busy in his aspiring labours: and so on, until the unfinished stairs and Piranesi both are lost in the upper gloom of the hall."

ST. PETER'S CHURCH, HAMBLEDON.

A STUDY IN ARCHITECTURAL DEVELOPMENT.

By J. RUSSELL LARKBY.

OFTEN the most interesting feature of ecclesiastical architecture in village churches is the joining together of the work of various centuries, caused probably by lack of funds sufficient to complete the building during one period of influence. The later building often envelopes or altogether hides the earlier structure, but in nearly all cases some traces of the earlier structure are observable. It is of the highest interest to visit a representative building and trace first the lowly Saxon structure, following as far as possible its simple history from the oblong nave and square chancel to the fully-developed building of the fifteenth century. At times, however, the simplicity of the Saxon church is lost; the Normans frequently demolished the Saxon church as not at all suited to the grander ideas of religious environment which they brought from Normandy. The Norman work is so massive that the builders seem to have built for all time, and by them it would have been deemed impossible that in after years the conquest of their massive buildings would be completed by the principle which they entirely ignored, that of light construction combined with strength. In a short time—surprisingly short when we consider the enormous differences of the periods—there arose from the Norman strength the apparently frail but beautiful architecture of the thirteenth century, having indeed a strong claim to be considered as the flower of English architecture.

If we wish to find a church thus illustrating the development of English architecture, we must seek in a district which has been for centuries the seat of a population which, if not abundantly rich in this world's goods, has been on the whole peaceful and contented. Again, the district in which we search must be free to a great extent from any seat of fifteenth-century commerce, when the church-builder followed the great uprising of trade and the consequent abundance of wealth which in those days meant an increase in the quantity of architecture. As, however, an increase of wealth is by no means a necessary element in the greater happiness of the individual, neither on the other hand is such an increase equivalent to an increase in the purity of architecture; of this there is very definite evidence in England.

The county of Hampshire, never the seat of active manufacture, but from time immemorial given up to peaceful agricultural pursuits, would seem to be the district in which to look for our typical church, and in few places is the quiet development of English architecture so well illustrated as at Hambledon. The church embraces Saxon, Norman, Early English, Decorated and Perpendicular features which, if simple, are of considerable interest to the student.

The remains of the Saxon work are somewhat obscured by additions, but they show the building as small and plain, probably very similar to the existing Saxon churches at Boarhunt and Corhampton (see the BUILDERS' JOURNAL for February 11th last). Its extent, however, is somewhat doubtful, but on the accompanying plan (Fig. 1) I have ventured to outline what may be justly regarded as its limits. The projections lettered A over the north arcade are strips of vertical masonry which may well have been pilaster strips on the walls of the Saxon church. Some similar strips also exist in the wall above the south arcade. Further east, and on the north side of the eastern nave, is a line of horizontal masonry (lettered B on plan), though not all necessarily *in situ;* up to the point C or a little beyond may be looked upon as the western termination of the Saxon building. From these evidences the Saxon church seems to have had a total length of about 55ft. and a breadth of 23ft. It may be of interest as throwing some light on the question to compare these measurements with those of the other Saxon churches in the district: —

Corhampton—Length, 55ft.
Breadth, 23ft.
Boarhunt— Length, 60ft.
Breadth, 23ft.

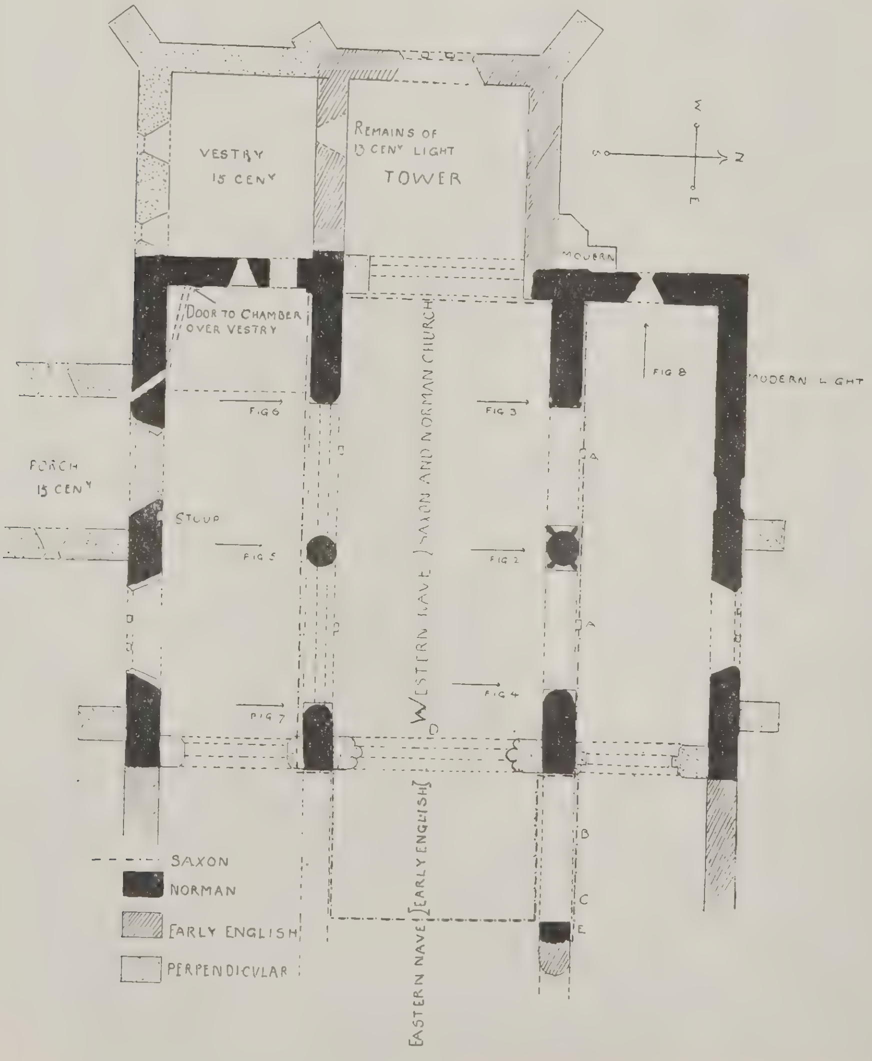

FIG. 1.—PLAN OF WESTERN NAVE, HAMBLEDON.

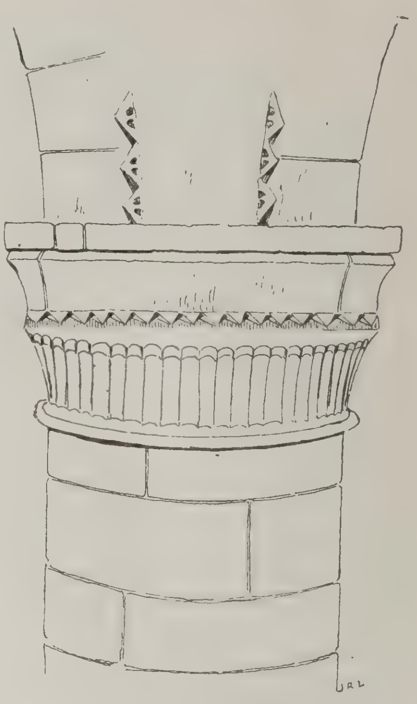

FIG. 2.—CENTRE PIER OF NORTH ARCADE.

It will thus be seen that a measurement of the Saxon remains at Hambledon gives a church of practically the same dimensions as existing Saxon churches in the locality. There is, it is true, a slight discrepancy in length, but in the case of Corhampton the chancel has been renewed in brick, though it probably retains its original size; at Boarhunt, owing to later alterations, the exact western termination of the Saxon church is somewhat uncertain. Allowing for these discrepancies as proving nothing beyond a slight deviation in plan, the measurements are sufficiently near to establish a strong likeness in the three churches.

With the coming of the Norman builder a period of great activity began at Hambledon, and, as in so many other cases, the small dimensions of the Saxon church quite failed to satisfy the religious ambitions of builders who had in their minds the memory of the Abbaye aux Dames at Caen and the other great churches of Normandy. At the same time, the Saxon church was not actually razed to the ground, which seems to suggest that the Normans considered the earlier work good enough to incorporate in their own building. This, however, was the utmost limit of their conservatism, and they proceeded just as they did at other places, and altered the church out of all recognition. The addition of aisles, a possible extension of the chancel—the former a drastic change in ground plan—completed the work of the Norman builder, who, after the sturdy manner of his kind, placed his hand on the walls of Hambledon church in an indestructible manner, so far as anything human can be indestructible.

The arches of the aisles occupy the exact position of the Saxon walls; in fact, they must be cut through the earlier work, since the pilaster strips before mentioned still occupy their original positions. The capitals of the north arcade are shown by Figs. 2, 3, and 4; their piers are massive, and the mouldings illustrate axe-carving in a very unmistakable manner; the arches are extremely massive, semicircular and square-edged, and on the south surface are highly ornamented by a band of nail-head and rosette ornaments, in some places renewed but generally unrestored. All the capitals have the square rudely-moulded abacus, which, as in nearly all early examples, does not follow the outline of the capital underneath. The central column of the arcade (Fig. 2) well illustrates the rule-of-thumb method employed in the production of Norman work; the irregularity, effective in its way, is the natural outcome of the rude methods of the time. The bases are characteristic, consisting of a hollow between two rounds, the whole supported by a plinth with foot ornaments to cover its projecting angles. The other capitals of the arcade are illustrated at Figs. 3 and 4, and speak for themselves. The capitals of the south arcade, although still Norman, illustrate a finer and rather later period in the style (see Figs. 5, 6 and 7). The pointed arches may here be taken as legitimate evidence of later date; they are recessed, and not single as in the more primitive north arcade; the abaci are circular on plan, but still square-edged, thus conforming to the shape of the lower members of the capital. In addition to this, there is a greater precision in the carving, suggesting the use of a finer tool than the axe used in the north arcade. All these points seem to suggest that a considerable time elapsed between the construction of the north and south aisles, not sufficient to alter the fundamental features but long enough to allow of a decided improvement in execution. A glance at the bases will be sufficient to confirm the unity of style, and a comparison of the capitals will clearly illustrate the difference in treatment. The unequal span of the arches is curious, and is another result caused by the lapse of time between their erection; this difference is not very noticeable except on plan.

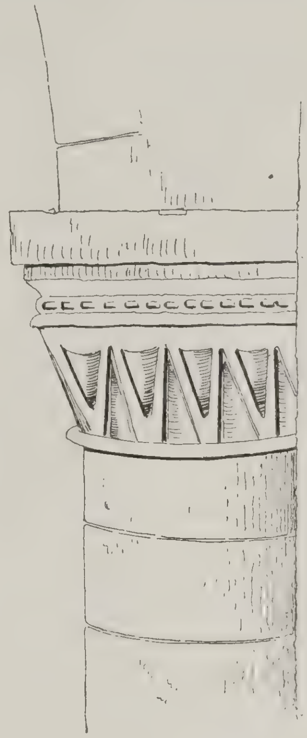

FIG. 4.—EAST RESPOND OF NORTH ARCADE.

In the west wall of the north aisle there is a small Norman window, presumably of the same date as the north arcade (Fig. 8, next page). A similar, but blocked-up, window exists in the south aisle, and by these we are able to establish the western extremity of the building after it emerged from Norman hands.

Hambledon church seems to have been altered in plan during each century of its existence, and in the thirteenth century an alteration greater than the preceding again completely transformed the structure. The Norman architect had evidently taken some pains to preserve the site of the Saxon high altar, and consequently the eastern arm of the church during the twelfth century was not imposing on plan or in elevation; neither could it have well accorded with the somewhat spacious dimensions of the Normanized Saxon nave. The thirteenth-century architect saw this, and in order to give a greater dignity to the chancel, to be obtained only by a lengthening of the church, he attained his object by a method at once striking and original. Wishing to preserve the Norman nave, there arose the novel plan of attaching a thirteenth-century church to the eastern arm of the Saxon building, which in its time had also been altered in the twelfth century. With this alteration the sanctuary was removed eastwards, and the site of the Saxon and Norman high altars now became nothing more than a part of the nave; the church thus has two naves and two chancel arches, *i.e.*, the present chancel arch, and the arch dividing the Norman chancel from the Norman nave (D on plan).

The work in the thirteenth-century nave is much lighter than the adjoining structure, but architecturally it is less satisfactory than the earlier work. The interest here rests mainly on the pillar marked E on plan; its western face exhibits ashlar with axe working, and it at one time stood in the Norman church, even if it does not mark the termination of the Norman structure. On either side of the present chancel arch there is a perpendicular squint, through which an excellent view of the altar may be obtained from the aisles of the eastern nave.

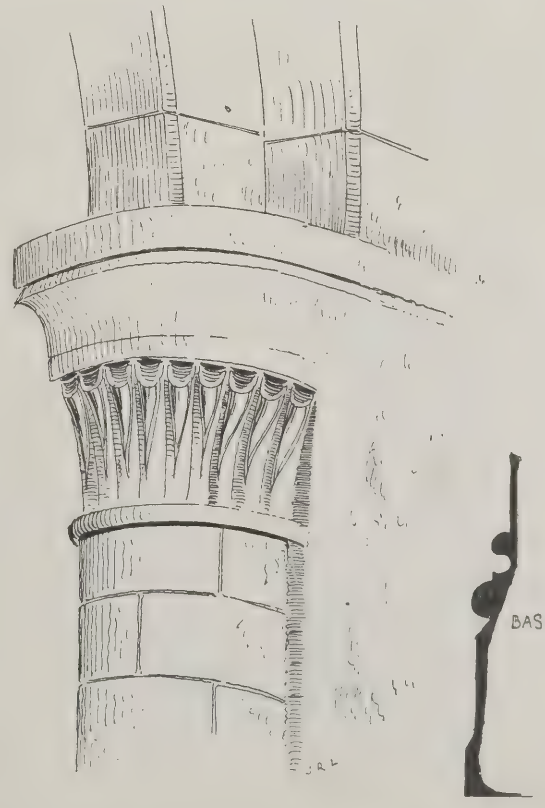

FIG. 7.—EAST RESPOND AND BASE OF SOUTH ARCADE.

B

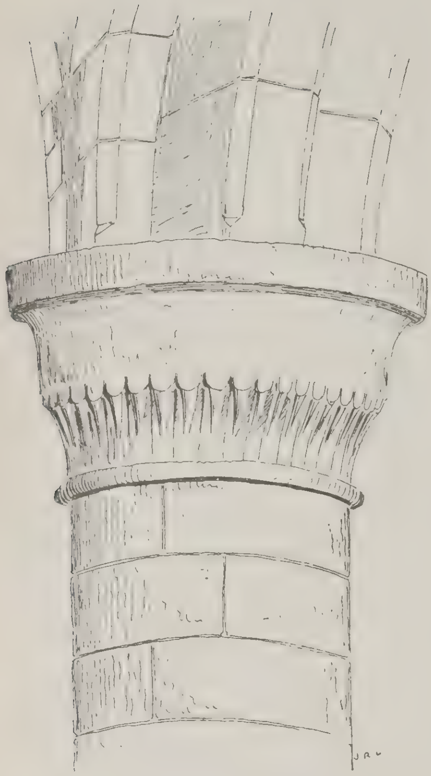

FIG. 5.—CENTRE PIER OF SOUTH ARCADE.

The porch, on the south wall of the western nave, is of considerable height, and its windows high in the wall were for the now destroyed parvis overhead.

During the fifteenth century a vestry was added, communicating with the south aisle of the nave; and over it was a second chamber, connected with the parvis by a gangway.

Standing at the west end of the tower, the extreme length of the church (about 130ft.) shows to great advantage, giving an effect only to be described as beautiful; the floor makes a gradual rise eastward, ending in a reverently tended chancel, which "remains as in times past."

Views and Reviews.

Spon's Price-Book.

This excellent book of memoranda and prices is always welcome, and the new issue (with which the book enters upon the thirtieth year of its existence) maintains the standard of former editions. It would be difficult to call attention to all the little additions and revisions which are constantly needed in a work of this sort in order to keep it up-to-date. There are, however, several features which may be noted, such as the rules for electric wiring issued by the Institution of Electrical Engineers, the Workmen's Compensation Act, and the revised R.I.B.A. schedule of architects' charges.
